

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

The New international year book

**THE NEW
INTERNATIONAL
YEAR BOOK**

**A COMPENDIUM OF THE WORLD'S
PROGRESS**

FOR THE YEAR

1920

PREFACE

Among the leading topics in the present volume—the nineteenth since the work began in 1898 and the fourteenth in the new series beginning in 1907—may be mentioned the following: The Presidential Election (article UNITED STATES), including summaries of the debates on the Treaty and other points at issue and the main features of the campaign; the League of Nations whose history during the first year of its existence is outlined under WAR OF THE NATIONS; and the long list of international quarrels, controversies, and partial settlements covered under WAR OF THE NATIONS and under the titles of the countries concerned, including the friction between France and England, the questions of German disarmament and reparations, the divergence of policy in respect to resumption of trade with Russia, Poland's war with the Soviet government, conflict among the Allies in respect to Poland, problems of Lithuania and the new Baltic states, Danzig, the Wrangel movement, Upper Silesia, the Adriatic Question and the Treaty of Rapallo, Armenia and the new Armenian Republic, the Turkish Treaty, the return of King Constantine to Greece, the Sinn Fein movement (article GREAT BRITAIN), spread of Bolshevism among Socialists (article SOCIALISM), difficulty between the United States and Japan, etc. Outside the political field the groups of articles dealing with labor subjects, agriculture, industries, and applied science are of especial importance, including AERONAUTICS; AGRICULTURE; CHEMISTRY, INDUSTRIAL; topics in ENGINEERING; MEDICAL PROGRESS; MILITARY PROGRESS (with an account of the military reorganization act); NAVAL PROGRESS; SHIPPING and SHIPBUILDING; the articles on the respective industries and products, etc. The death roll, including the Empress Eugénie, Wundt, Howells, and many other famous names, is unusually long.

FRANK MOORE COLBY.

LIST OF CONTRIBUTORS

AGRICULTURE, BOTANY, FOOD, FORESTRY, HORTICULTURE, IRRIGATION, ETC.

EDWIN WEST ALLEN, PH.D.,
UNITED STATES DEPARTMENT OF AGRICULTURE,
AND
ALFRED CHARLES TRUE, PH.D.,
UNITED STATES DEPARTMENT OF AGRICULTURE;
E. H. SHINN (AGRICULTURAL EDUCATION);
WALTER H. EVANS, PH.D. (BOTANY AND
PLANT DISEASES); JOHN I. SCHULTE (CROP
PRODUCTION); CARL W. LARSON (DAIRY-
ING); WALTER H. BEAL (FERTILIZERS AND
SOILS); HOWARD L. KNIGHT (FOOD AND
NUTRITION: AGRICULTURAL LEGISLATION);
EDWIN J. GLASSON (HORTICULTURE AND
FORESTRY); RAY P. TERLE (RECLAMATION);
GEORGE M. ROMMEL (STOCK RAISING); AND
WILLIAM A. HOOKER (VETERINARY MED-
ICINE).

ANTHROPOLOGY (WITH ETHNOLOGY)

ROBERT H. LOWIE, PH.D.,
AMERICAN MUSEUM OF NATURAL HISTORY,
AND
CLARK WISSLER, PH.D.,
AMERICAN MUSEUM OF NATURAL HISTORY.

ARCHAEOLOGY

OLIVER SAMUEL TONKS, PH.D.,
PROFESSOR OF ART, VASSAR COLLEGE.

ARCHITECTURE

C. MATLACK PRICE,
FORMERLY EDITOR OF THE *Architectural Record*.

ASTRONOMY, METEOROLOGY

C. FITZHUGH TALMAN,
UNITED STATES WEATHER BUREAU.

CHEMISTRY; EXPOSITIONS; CELEBRATIONS

MARCUS BENJAMIN, PH.D., Sc.D., LL.D.,
EDITOR FOR THE UNITED STATES NATIONAL
MUSEUM.

CIVIL ENGINEERING AND MANUFACTURING SUBJECTS; AERONAUTICS; ETC.

HERBERT TREADWELL WADE,
LATE CAPTAIN, ORDNANCE DEPARTMENT, U. S.
ARMY.

DRAMA (AMERICAN AND ENGLISH)

OLIVER MARTIN SAYLER, M.A.,
DRAMATIC CRITIC, AUTHOR OF *The Russian
Theatre under the Revolution*.

**ECONOMIC, SOCIAL AND POLITICAL
SCIENCE SUBJECTS**
EDITORIAL STAFF.

EDUCATION IN THE UNITED STATES

MILO B. HILLEGAS, PH.D.,
FORMERLY COMMISSIONER OF EDUCATION OF
VERMONT.

ELECTRICAL ENGINEERING SUBJECTS

REGINALD GORDON,
ASSOCIATE EDITOR OF *Industrial Management*.

**EXPLORATION; POLAR RESEARCH;
ALASKA**

A. W. GREELY, PH.D.,
MAJOR GENERAL, UNITED STATES ARMY: COM-
MANDER GREELY POLAR EXPEDITION.

FINANCIAL REVIEW

O. C. LOCKHART, PH.D.,
NATIONAL BANK OF COMMERCE, NEW YORK CITY.

FRENCH LITERATURE

ALBERT SCHINZ, PH.D.,
PROFESSOR OF FRENCH LITERATURE, SMITH
COLLEGE.

GEOLOGY; MINERALOGY

CHARLES P. BERKEY,
PROFESSOR OF GEOLOGY, COLUMBIA UNIVERSITY.

GERMAN LITERATURE

AMELIA VON ENDE.

**INTERNATIONAL PEACE AND ARBI-
TRATION**

CLINTON ROGERS WOODRUFF, LL.B.,
SECRETARY OF THE NATIONAL MUNICIPAL
LEAGUE AND MEMBER OF THE MOHONK CONFER-
ENCE; FORMERLY PRESIDENT OF THE BOARD OF
PERSONAL REGISTRATION, PHILADELPHIA.

**LITERATURE, ENGLISH AND AMERI-
CAN**

DAVID LAMBUTH, A.M.,
PROFESSOR OF ENGLISH, DARTMOUTH COLLEGE.

**LITERATURE (CONTINENTAL): SEE
FRENCH LITERATURE; GERMAN LIT-
ERATURE; ETC.**

MEDICAL SUBJECTS

EDWARD PREBLE, M.D.,
NEW YORK CITY.

MILITARY PROGRESS

C. DEWITT WILLCOX,
COLONEL, U. S. A.; PROFESSOR OF MODERN LAN-
GUAGES, U. S. MILITARY ACADEMY.

MUSIC

ALFRED REMY, M.A.,
EXTENSION LECTURER, COLUMBIA UNIVERSITY,
AND FORMERLY PROFESSOR OF HARMONY AND
COUNTERPOINT, INTERNATIONAL CONSERVATORY,

NEW YORK: EDITOR OF BAKER'S *Biographical Dictionary of Musicians*.

NAVAL PROGRESS AND RELATED SUBJECTS

LEWIS SAYRE VAN DUZER,
CAPTAIN, U. S. N., RETIRED; WRITER ON NAVAL
AND NAUTICAL SUBJECTS.

PAINTING AND SCULPTURE

GEORGE KRIEHN, PH.D.,
EXTENSION LECTURER IN THE HISTORY OF ART,
COLUMBIA UNIVERSITY; LECTURER, WOMAN'S
ART SCHOOL, COOPER UNION.

PHILOLOGY (CLASSICAL)

CHARLES KNAPP, PH.D.,
PROFESSOR OF CLASSICAL PHILOLOGY, BARNARD
COLLEGE, COLUMBIA UNIVERSITY.

PHILOLOGY (MODERN)

JOHN LAWRENCE GERIG, PH.D.,
ASSOCIATE PROFESSOR OF CELTIC, EXECUTIVE
OFFICER, DEPARTMENT OF ROMANCE LANGUAGES,
COLUMBIA UNIVERSITY.

PHYSICS

HENRY D. HUBBARD,
SECRETARY, UNITED STATES BUREAU OF STAND-
ARDS.

PSYCHOLOGY; PSYCHICAL RESEARCH

EDWARD BRADFORD TITCHENER, DSc.,
PH.D., LL.D., LITT. D.,
SAGE PROFESSOR OF PSYCHOLOGY, GRADUATE
SCHOOL OF CORNELL UNIVERSITY.

RAILWAYS

WILLIAM E. HOOPER
FINANCIAL EDITOR, *Railway Age*.

ROMAN CATHOLIC CHURCH

THOMAS F. MEEHAN,
EDITORIAL STAFF, *America*.

**SANITARY ENGINEERING AND MUNI-
CIPAL SUBJECTS**

MOSES NELSON BAKER, PH.D., C.E.,
ASSOCIATE EDITOR OF THE *Engineering News-
Record*.

SCANDINAVIAN LITERATURE

HARRY V. E. PALMBLAD, A.M.,
PROFESSOR OF MODERN LANGUAGES, PHILLIPS
UNIVERSITY.

SPANISH LITERATURE

JOHN DRISCOLL FITZ-GERALD, PH.D.,
MEMBER OF THE HISPANIC SOCIETY OF AMERICA;
CORRESPONDING MEMBER OF THE SPANISH ROYAL
ACADEMY, AND OF THE ROYAL ACADEMY OF HIS-
TORY OF MADRID; PROFESSOR OF SPANISH, UNI-
VERSITY OF ILLINOIS.

SPORTS

CHARLES A. TAYLOR,
MEMBER OF THE STAFF OF THE *New York
Tribune*.

UNIVERSITIES AND COLLEGES

MILO B. HILLEGAS, PH.D.,

WAR OF THE NATIONS

FRANK MOORE COLBY, M.A.,
AND EDITORIAL STAFF.

ZOOLOGY

AARON L. TREADWELL, PH.D.,
PROFESSOR OF BIOLOGY, VASSAR COLLEGE.

THE NEW INTERNATIONAL YEAR BOOK

ABNEY, Sir WILLIAM DE WIVELESIE. British scientist, died at Folkestone, England, December 2. Since 1903 he had been scientific adviser to the Board of Education and a member of the advisory council for education to the War Department. He was born at Derby, July 24, 1843, and became a captain of the Royal Engineers in 1873. He was president of the Royal Astronomical Society 1893-5 and of the Physical Society 1895-7. He was celebrated for his researches in photography and spectroscopy, in which fields he published several important books, including *Instruction in Photography* (1870); *Treatise on Photography* (1875); *Color Vision, Color Measurement and Mixture* (1893); *Trichromatic Theory of Color* (1914). He also wrote a volume on Thebes in 1876, and *The Pioneers of the Alps* (with C. D. Cunningham) in 1888.

ABYSSINIA. A monarchy in northern Africa to the southwest of the Red Sea with Sudan, Massaua, the French Somali coast, and the British Somali Protectorate on the west, and British East Africa and the Uganda Protectorate on the northwest and south. Its estimated area is 350,000 square miles and its estimated population more than 8,000,000. It is divided into the following nine provinces: (1) Harar and dependencies; (2) Wollo; (3) Kassa and Magi; (4) Gore; (5) Tigre; (6) Damot and Gojam; (7) Equatorial Provinces; (8) Gondar; (9) Gima or Jimma. Its independence was recognized by Italy on October 26, 1896, by the convention of Addis Abeba and its frontiers were determined by treaties with Great Britain and Italy. On December 13, 1906, Great Britain, France and Italy undertook to preserve its integrity and agreed that henceforth industrial concessions should be so granted as not to injure the interests of any of the contracting Powers. They also agreed to abstain from interfering in the internal affairs of the country, but to act together in harmony for the protection of their interests in bordering lands, etc.

The inhabitants have been Christians since their conversion in the fourth century and they have remained members of the Alexandrian church under an Abuna or head bishop who is always a Copt and appointed by the patriarch of Alexandria, subject to a native prelate known as the Echehebeh. The ecclesiastics number about 100,000. The people are generally illiterate, education being for the most part confined to the clergy. Only one school was reported, namely,

that of Addis Abeba, and this had about 100 pupils, for although an edict was passed in 1907 declaring education compulsory it has remained a dead letter. The administration of justice is in the hands of the provincial governors and chiefs with right of appeal to the emperor; and the basis of the legal system is the code of Justinian. The people are of Semitic origin and consist of the following race groups: Gallas, Somalis, Shoans, Tigrisians and Danakils. The Gallas constitute fully one-half of the population and are chiefly pastoral and agricultural. The Shoans, from whom the ruling class is derived, number about 1,500,000. The Danakils are Mohammedans. There are also some negroes in the southern part. The chief pursuits are agriculture and grazing; though the soil is capable of producing diverse crops, culture is backward. Theoretically the soil belongs to the Negus or Emperor and the system of private property can hardly be said to exist. Stock-raising is of some importance, and cattle, sheep and goats are plentiful. Breeds of small horses and small donkeys are raised and are used as pack animals. Cotton, sugar cane, dates, coffee and the vine are cultivated to some extent. Coffee production is increasing and besides the cultivated coffee, which is the long berry Mocha, there is in the southern and western portions a considerable growth of wild coffee plants. The total exports of coffee were estimated in 1916 at 6364 metric tons. Other native products are hides and skins, millet, barley, wheat, tobacco and gesho. The manufacturers are in a backward state, but in some districts hatchets, knives and other implements are made. Minerals are found, including iron, coal, sulphur, copper and silver, but are not extensively worked. In some parts of the country placer gold-mining is carried on. Commerce takes for the most part the route of the French Ethiopian railway, but there is a considerable caravan trade in the interior. The chief exports are hides and skins, coffee, wax, civet, ivory and butter. Spices, gums, gold and rubber are also exported to some extent. The imports, which are chiefly from England, France, India, Italy and the United States, comprise for the most part manufactures, including cotton goods, arms and munitions, liquors, railway materials, sugar, and petroleum. The exports through Jibuti in 1917 were reported as follows: Hides, 5,704,423 kilos; coffee, 5,092,647 kilos; and beeswax, 381,313 kilos. In that year the exports to the Sudan were reported as follows:

Coffee, £E105,895; wax, £E18,265. Imports from the Sudan in 1917 amounted to £E65,226. The Board of Trade reported the exports from Abyssinia into Great Britain for 1919 at £28,947 and the imports from Great Britain to Abyssinia at £10,822. Highway communications are backward and transportation depends on mere trails on which pack animals, including sometimes camels, are employed, but in the neighborhood of the capital some few miles of metaled road have been made. There is a French railway line to Jibuti and to Diré Dawa, 187 miles in length, and after January, 1909, measures were taken to complete the line to Addis Abeba. This reached the capital in 1917. Telegraph lines connect Addis Abeba with Harar, with Jibuti in French Somali, and with Massaua in Eritrea, the length being about 1056 miles. There is also a small mileage of telephone wire. The coin of the country is the Maria Theresa dollar, to which in late years has been added the Menelek dollar of about the same value, that is, in the neighborhood of fifty cents.

The government is feudal, under a sort of state council consisting of the chief notables. In 1919 a form of cabinet government was introduced. The army amounts to about 200,000 men, but is ill equipped and ill organized. After the death of Menelek in December, 1913, his grandson, Lidj Yasu, succeeded, but was deposed September 27, 1916, and succeeded by a daughter of Menelek, Waizeru Zauditu, born in 1876. She was crowned February 11, 1917, and the chief or Ras, Taffaria, was proclaimed regent and heir to the throne. The government was recognized by Great Britain, but unstable conditions as the result of civil war prevailed during 1917, 1918 and 1919.

ACADEMY, FRENCH (ACADÉMIE FRANÇAISE). The oldest of the five academies which make up the Institute of France and officially considered the highest; founded in 1635; reorganized in 1816. The list of its members known as the Forty Immortals in 1920 was as follows: Othénin de Cléron, Comte d'Haussonville; Charles Louis de Saules de Freycinet; Louis Marie Julien Viaud (Pierre Loti); Ernest Lavisse; Paul Bourget; H. G. Anatole François Thibault (Anatole France); Gabriel Hanotaux; Henri Emile Lavedan; Paul Deschanel; Frédéric Masson; René Bazin; Alexandre Ribot; Maurice Barrès; Maurice Donnay; Jean Richepin; Raymond Poincaré; Eugène Brieux; Jean Aicard; René Doumic; Marcel Prévost; M'g'r Duchesne; Henri de Régnier; Denys Cochin; General Lyautey; Emile Boutroux; Alfred Capus; Pierre de la Gorce; Henri Bergson; Marshal Joffre; Louis Barthou; R. M. A. Tardiveau (R. Boylesse); François de Curel; Alfred Baudrillard; Marshal Foch; Georges Clemenceau; Jules Cambon; Henri Bordeaux; Robert de Flers; Joseph Bédier; Louis Chevrillon. Three of the above were elected in 1920, namely Robert de Flers, Joseph Bédier and André Chevrillon, whose receptions were to be held between February 7 and April 15, 1921, at intervals of one month. The Academy held its great annual public meeting on November 25th, with M. Raymond Poincaré presiding. There were speeches by the presiding officer and reports from M. Frédéric Masson, and M. Jean Richepin. Meanwhile the work on the dictionary was proceeding and had advanced into the letter H.

Of those elected in 1920, Robert de Flers is a

popular dramatist, who had won great success before the war by a long series of plays written in collaboration with G. A. Caillavet, including one, *L'habit vert*, which had humorously satirized the Academy itself. Joseph Bédier is a prominent philologist. He was an active propagandist during the war and his writings, including an edition of the diaries of German soldiers, published early in the war, were widely circulated in translations in the countries of the Allies. André Chevrillon is the nephew of Taine and the author of books on India and on Ruskin in English literature, among other subjects, and has visited the United States.

ACADEMY OF ARTS AND LETTERS, AMERICAN. Founded in 1904 by seven members of the National Institute of Arts and Letters. This society is patterned on the French Academy in Paris. Membership is limited to 50 persons. Beginning in 1909 a series of annual meetings have been held. Until 1919 William Dean Howells was president of the Academy, but his death on April 11, 1920, caused the election of a new president, William Milligan Sloane. During 1920 four new members have been elected to the Academy: Childe Hassam of New York, David Jayne Hill of Washington, D. C., Lorado Taft of Chicago, Ill., and Booth Tarkington of Indianapolis, Ind. These members were to fill vacancies caused by the death of Julian Alden Weir, Horatio William Parker, and William Dean Howells, and one chair previously vacant.

The fifth series of addresses given under the auspices of the Academy was given at the Chemists' Club, 50 East 41st Street, New York City, during 1920. Speakers and their subjects were as follows: "The Spirit of Italy," by William Roscoe Thayer; "Music and Liberty," by William J. Henderson; "The English Language in America," by Paul Shorey; "The Literature of Japan," by William Elliot Griffis.

In 1920 the membership list was as follows: John Singer Sargent, Daniel Chester French, John Burroughs, James Ford Rhodes, William Milligan Sloane, Robert Underwood Johnson, George Washington Cable, Henry van Dyke, William Crary Brownell, Basil Lanneau Gildersleeve, Woodrow Wilson, Arthur Twining Hadley, Henry Cabot Lodge, Edwin Howland Blashfield, Thomas Hastings, Brander Matthews, Thomas Nelson Page, Elihu Vedder, George Edward Woodberry, George Whitefield Chadwick, Abbott Henderson Thayer, George de Foret Brush, William Rutherford Mead, Bliss Perry, Abbott Lawrence Lowell, Nicholas Murray Butler, Paul Wayland Bartlett, Owen Wister, Herbert Adams, Augustus Thomas, Timothy Cole, Cass Gilbert, William Roscoe Thayer, Robert Grant, Frederick MacMonnies, William Gillette, Paul Elmer More, Barrett Wendell, Gari Melchers, Elihu Root, Brand Whitlock, Hamlin Garland. Those elected after 1918 were Paul Shorey, Charles Adams Platt, Maurice Francis Egan, Archer M. Huntington, Childe Hassam, David Jayne Hill, Lorado Taft, Booth Tarkington. The permanent Secretary of the Academy in 1920 was Robert Underwood Johnson. Headquarters are at 347 Madison Avenue, New York City.

ACADEMY OF SCIENCES, NATIONAL. A body of distinguished American scientists incorporated by act of Congress, March 3, 1863, for the purpose of promoting scientific research and of examining, investigating, and reporting

upon any subject of science or art when called upon to do so by any department of the government. There are two meetings held each year: An annual meeting, held in Washington in April, and an autumn meeting, held in November, the time and place decided upon at the April meeting. The annual meeting of 1920 was held April 26th-28th. Among the papers read were: "Conservation of National Resources," by J. M. Clarke; "On the Rate of Growth of the Population of the United States since 1790 and its Mathematical Expression," by Raymond Pearl; "Growth and Development as Determined by Environmental Influences," by Franz Boas; "Plural Births in Man," by C. B. Davenport; "A Psychological Study of the Medical Officers of the Army," by R. M. Yerkes; "The Vertical Interferometer," by A. A. Michelson; "The Scale of the Universe," by H. Shapley and H. D. Curtis; "The Influence of Cold in Stimulating the Growth of Plants," by F. V. Coville; "Recent Notable Progress in the Theory of Numbers," by L. E. Dickson; "The Air Resistance of Spheres," by L. J. Briggs; and "Reports on the Researches of the Late Professor C. C. Trowbridge," by Mabel Weil. A large number of other subjects were discussed at this meeting and at the autumn meeting held at Princeton University, November 16th-17th. The Academy issues a Report, prior to each annual meeting; *Biographical Memoirs* and *Scientific Memoirs*, at irregular intervals; and the *Proceedings*, the latter a periodical of twelve numbers each year, the only publication issued by the Academy which requires subscription. In 1920 there were 189 active members, one honorary member, and 37 foreign associates. There are 17 trust funds totalling \$473,303.84. Officers for 1921 are: President, Charles D. Walcott; vice-president, A. A. Michelson; home secretary, Charles G. Abbot; foreign secretary, George E. Hale; and treasurer, Frederick L. Ransome. Headquarters are care of the Smithsonian Institution, Washington, D. C.

ACCIDENTS. See AUTOMOBILES; RAILWAY ACCIDENTS; SAFETY AT SEA.

ACTIVATED SLUDGE. See SEWERAGE AND SEWAGE PURIFICATION.

ADAM, PAUL. French writer, died in Paris, January 2nd. He was born in Paris in 1862 and during the Boulangist movement in 1889 was an unsuccessful candidate for parliament. In his first novel, *Chair molle* (1885), he showed the influence of Zola. He later wrote a number of stories in the vein of the symbolists, and several historical romances. One of the most celebrated of his writings was *La ville inconnue*, which had passed through ten editions in 1911. He grouped his novels dealing with contemporary life under the title of *L'époque* and those dealing with an earlier time, under the title *Le temps et la vie*. The stories which showed the influence of the symbolists were: *Robes rouges* (1891); *Le mystère des foules* (1895); and *La Bataille d'Ude* (1897). The historical romances, dealing with the period 1792 to 1830, were: *La force* (1898), new ed. (1910); *L'enfant d'Austerlitz* (1902); *La ruse* (1903); and *Au soleil de juillet* (1903). In 1913 he wrote the problem novel, *Stéphanie*. He also wrote the drama entitled *Le ouïvre* (1896), and before that, in collaboration with G. Mowrey, another, entitled *L'automne* (1893).

ADAMS, WILLIAM FORBES. Bishop, died

March 5, 1920. He was born at Enniskillen, Ireland, Jan. 2, 1833; came to the United States in 1841, and was admitted to the Mississippi bar in 1844, but determined to enter the ministry. He was ordained priest in 1860 and was rector in New Orleans from 1860 to 1875, when he was consecrated bishop of New Mexico and Arizona. He resigned soon afterwards on account of failing health and from 1876 to 1887 was rector at Vicksburg, Miss., and from 1887 to the time of his death he was bishop of Easton.

ADELPHI COLLEGE. A non-sectarian institution of the higher education at Brooklyn, N. Y.; founded in 1896. In the summer school of 1920, the enrollment was 145, and for the year 1920-21 in the regular college it was 294; in the extension it was 129. There were 22 members in the faculty. The library contained 17,500 volumes. President, Frank Dickinson Blodgett, LL.D.

ADEN. A British territory consisting of a volcanic peninsula on the Arabian coast which forms an important coaling station on the route to the East and is well fortified. It lies about 100 miles east of Bab-el-Mandeb and part of the Presidency of Bombay. The area is about 75 square miles; with the Protectorate, about 9000 square miles. The settlement includes also the island of Perim with an area of five square miles. The population in 1911 was 46,165 and the population of the Protectorate was about 100,000. The chief industry is salt production and the next in importance is the manufacture of cigarettes. It has mainly a transit trade. In 1918-19 the imports by sea were valued at £5,185,209; by land, £105,129; total including treasure, £5,470,743. The chief imports were cotton piece goods, grain, hides and skins, coal, tobacco and provisions. The exports by sea in 1918-19 were £4,536,949; by land, £16,200; total, including treasure, £4,573,916. The chief exports were coffee, gums, hides and skins, cotton goods, and provisions. The shipping in 1918-19 included 500 merchant vessels of 950,141 tons net entered, of which 323 were British. The government is under a political resident with four assistants.

ADVANCEMENT OF SCIENCE, AMERICAN ASSOCIATION FOR THE. This is an association founded in 1848 on the principle that in a democracy where no dependence can be had upon a leisure class, science can only be supported as a result of the organization of scientific men. The association has since its beginning done work of the greatest importance in encouraging scientific research and promoting interest in its results. It consists of affiliated national societies which either meet regularly on their own account or during the annual convention week of the association which is held at the close of each year. During the 10 years of its existence the meetings have been held in Baltimore, Boston, Minneapolis, Washington, Cleveland, Atlanta, Philadelphia, Columbus, New York, Pittsburgh, and St. Louis. There is also a Pacific Coast Division which holds meetings independently in the summer and a general meeting under its direction was held in 1915. The official organ of the association is the weekly journal *Science*. Membership is about 15,000.

The annual meeting in 1920 was held in Chicago on December 29th-31st. A paper was read by Prof. A. A. Michelson, of the University of

Chicago entitled "The Application of Interference Methods to Astronomical Measurement," in which he announced the perfecting of a device for measuring the diameter of stars by interference methods. He gave the result of the first application of the device to one of the stars in the constellation of Orion (Alpha Orionis) whose distance has already been determined by parallax methods. He showed that this star, Betelgeuse, has a diameter of 260,000,000 miles or 300 times that of the sun. The first test of this method was made at the Mount Wilson Observatory in southern California. Professor Michelson, who is recognized as one of America's foremost scientists, has been working on this device for a number of years.

In a paper by Dr. Robert W. Woods of the Johns Hopkins University, he explained what is known as the "chemical eye." This device was used for signaling during the war. Taking the ultra-violet rays, which are invisible to the naked eye, Dr. Woods invented a mechanism which can detect these rays and make them visible to the human eye. A large number of other addresses were read of great value to science.

ADVENT CHRISTIANS. See ADVENTISTS.

ADVENTISTS. The Seventh-Day Adventists is the largest branch of this denomination. The latest available figures were for 1919 which showed: 2254 churches with a total membership of 95,645; 708 ordained ministers; 434 licensed ministers; 762 licensed missionaries, with others making a total number of workers of 2881. Total tithe receipts amounted to \$3,313,307.05 or \$34.64 per capita. Total offerings to foreign missions amounted to \$789,691.63. Total contributions for home missionary work amounted to \$525,856.66. There were 2987 Sunday schools with a total membership of 96,351 pupils; the 1284 church buildings had an estimated value of \$2,753,425.30; church schools numbered 715 with a total enrollment of 15,968; young peoples' societies numbered 1156 with a total membership of 22,128. Total contributions for young peoples' work amounted to \$96,720.94. The denomination maintained seven publishing houses, publishing literature in 96 languages. Volumes issued during the year numbered 3015. There are 158 mission fields and 77 educational institutions connected with the church, 16 of which carry full college courses, notably Loma Linda College, Pacific Union College, and Walla Walla College.

Other branches of the Adventists are the Adventists Christian Church, which in 1916 (the latest available statistics) had 30,316 communicants, 640 churches, and 826 ministers (the figures for 1920 being about the same); the Adventists Church of God, with about 10,000 communicants, 100 churches, and 80 ministers in 1920. This denomination was about to build a college in the Central States at a cost of \$100,000. Other branches of the Adventists are Life and Advent Union, with about 700 communicants, 20 churches, and 15 ministers; and the Church of God and Jesus Christ, with about 4000 communicants, 90 churches and 50 ministers.

AERONAUTICS. In no field of activity was the after-war readjustment more conspicuous than in many of the fields of aeronautics. Vast numbers of airplanes and airships had been designed, built and used in the World War, and they had figured to a remarkable degree in mili-

tary and naval tactics. In an incredibly short space of time improved machines had been designed and developed and hosts of intrepid young men had become skilled in their operation and use. But design and use so rapidly developed had been with the single aim of war, and once hostilities were terminated a vast amount of material and a large personnel were left without corresponding civil activities to which their special equipment and talents could be immediately adjusted. In other words where the military side of aeronautics had advanced by leaps and bounds, in its civil application it had all but languished during the war. However vast industries had been built up, improved machines developed and even transatlantic flight as we saw in the 1919 YEAR BOOK accomplished. The first application was for mail transportation and while there were many sporadic attempts in this field in Europe, the United States, as is related below, was the first to undertake aerial mail service on a wholesale and practical scale. This was developed and in addition to the use of unnecessary military and naval planes, newer models were tested.

In connection with public and private mail and parcel routes one of the developments of the year was to secure increased carrying capacity both for freight and passengers. In fact it was realized that there must be increased efficiency and power to secure commercial success. Accordingly various passenger craft able to accommodate a number of people in large cabins were placed in operation on many routes, and at the end of the year airplanes to carry one hundred or more people were seriously proposed or were reported to be under construction. With all of this however there was confessedly a lack of general demand for aircraft and the natural explanation was that the financial and industrial condition was not such as to warrant large investments in what must be considered a hazardous and uncertain undertaking, though the eventual future success was admitted.

As a result, the use of aircraft outside of the government services while promising and growing was rather sporadic and unevenly distributed, and the same was true of the demand for machines, even when the salvaged or superfluous machines of the military and naval forces were put on the market. This condition was also reflected in design for now the improvements became rather refinements both in the machines themselves and in their power plants, though many of these improvements were dictated by sound principles of mechanical engineering. Many of the leading types were perfected, while newly designed machines did not reveal any radical innovations. However the industry was maintained in such a condition that once industrial conditions improved and commerce and business enterprise developed aircraft would be ready to play their part.

In Europe during the year there was an increased number of passenger routes established and maintained, their operation being attended by regularity of service and safety. Not all were financially successful, however, and this was explained as due to existing conditions rather than to shortcomings in the machines and airplane traffic generally. In America passenger business has lagged somewhat, at least in the establishment of regular routes and service but there was increased use of airplanes for

practical communication even outside of the mail service.

In many countries the assimilation of aeronautics to more normal conditions from those of war presented legislative and administrative problems. In fact even in the military and naval services themselves the position of aviation continued to be discussed. In the United States there were demands for a special national department or administration of aviation while the National Advisory Council of Aeronautics continued to function, composed as it was of notable men. In Europe readjustments were not so much hindered or helped by government action save as they concerned political and financial considerations.

A necessary adjunct of aerial travel is a sure means of communication between aircraft and the ground and other aircraft. Improvements in the radio telephone were made during the year, and on November 10th, the United States navy announced that its instruments could be used up to 300 miles. This method of communication had more than military importance for in the detection of forest fires or in mapping or surveying ability to transmit intelligence to a ground station promptly is a most valuable consideration.

So far as capacity was concerned for American machines a mark was set on September 29th when a large bombing plane, the largest yet built in America, driven by three Liberty motors was accepted by the Army Air Service after trials at Mitchell Field, Long Island, N. Y. This of course indicated a machine that readily could be modified from strictly military purposes for passengers and freight.

In Italy during the year, it was reported that Gianni Caproni, the aeroplane inventor, was considering the construction of a huge airplane which would carry 300 persons across the Atlantic in about 36 hours. In the plans for this machine due provision was to be made for dining and sleeping accommodations on board.

Signor Caproni, during the year was at work on a somewhat smaller airplane capable of carrying 100 persons a distance of 500 miles. This was reaching completion at the end of the year and the larger machine was to be put under way early in 1921.

The comparative advantages and uses of monoplane and biplane continued under discussion and experiment during the year, with improved design and construction being shown particularly for the monoplane. All-metal monoplanes were being turned out for various conditions of service and showed greater strength and made possible relatively more powerful engines capable of more sustained flights.

As showing the trend of airplane design during 1920 one must consider the attention paid to the wings of the various machines, particularly those of high-speed airplanes. In new designs variable camber and variable surface wings were introduced, the former being used in the Dayton-Wright monoplane flown by Rinehart at the Gordon-Bennett competition. By varying the wing surface as was done in certain French high-speed machines it was possible to secure a range of speed from 125 miles to about 30 miles an hour thus increasing the facility of landing which had been a weak point with the swifter planes.

With increased size of machines there have

been developments in the power plants and many improvements and refinements added to the engine. To secure increased power and safety a number of engines are used on a single plane so that they may be run together, or one disconnected for repair as in case of mishap. With greater leisure and the practical experience of the war, the automotive engineers who specialized in this field have sought to perfect their engines and the result has been longer runs and greater reliability.

A typical instance is that of the Hispano-Suiza engine at the hands of the engineers of the Wright Aeronautical Corporation. This engine was first made for the United States Air Service in 1917, the first being turned out by the Wright plant in July, 1917. As a result of many improvements and re-designing, the Wright Corporation changed the name of the engine from the Wright-Hispano to Wright. The Hispano engine when first imported to the United States as the best of existing European types had many strong points including lightness and flexibility, but it lacked durability and the Wright Corporation which purchased the American rights sought this important improvement even when the air service was demanding in 1917 and 1918 larger production. The first 2500 Hispano-Suiza engines made at the big New Brunswick plant of the Wright Corporation were only slightly modified, but these modifications were so successful that a number of changes in design were made with the consent of the Air Service and subsequently there were further improvements.

An echo of the famous transatlantic flight of the NC-4, discussed in the YEAB BOOK for 1919, was a trip of this airplane early in 1920 down the Atlantic Coast and up the Mississippi River to Cairo, Ill., returning to the Naval Air Station at Rockaway Point, N. Y., on January 27th. It had then negotiated 7740 nautical miles. Long-distance trips however were quite common during the year and on April 25th Clifford Webster in a Curtiss HS-2L flying boat with two passengers flew 1345 miles from Florida to New York in 18 hours and 27 minutes.

On Monday, Nov. 1, 1920, the first American passenger air line service was inaugurated, to operate on a daily schedule between Key West and Havana, a distance of about 90 miles, for which a little over one hour was required. Six Aëromarine cabin flying boats of the largest size ever used for the transportation of passengers were put into service between the Florida Keys and the Cuban capital. These big boats, which were a development of the F-S-L flying boats of the United States navy have a span of 104 feet, are fitted with two 400 h.p. Liberty engines, and accommodate in comfort 11 passengers.

There are two passenger cabins between which is located the control compartment, housing the dual control gear (permitting the pilot to surrender control at any time to his assistant) and the necessary air navigation instruments. Two pilots and a mechanic make up the crew of each of these flying boats. An interesting and useful work of the Air Service on the Pacific Coast of the United States was the patrol of the forests during the dry season in order to detect and report promptly forest fires. In Oregon and California 494 forest fires were located and reported, in many cases radio reports being rendered promptly to the Forest Service so that

preventive measures could be taken by the rangers. It was estimated that the Air Forest Patrol during the year was the means of saving some \$25,000,000 worth of timber. The airplane was also being used in the Dominion of Canada by the government, and the Royal Canadian Mounted Police decided that for outpost duty in outlying districts airplanes and flying boats could be used with advantage, and accordingly they were adopted. An interesting event of the year was the unveiling of a monument to Wilbur Wright on July 17th at Le Mans, France. The monument was the work of the French sculptor Landeroski and the architect Bigot. It is a column 40 feet high carved with figures, including those of Orville and Wilbur Wright and the names of their precursors in aviation from Dædalus. There were elaborate and appropriate ceremonies in connection with the dedication. The monument stands hard by the cathedral.

CIVIL FLYING IN GREAT BRITAIN. On May 1, 1919, civil flying was resumed in Great Britain and a number of commercial ventures were launched ranging from passenger and express service to the Continent to less ambitious local activities. At the end of the year, or May 1, 1920, there were reported for the 12 months 38,954 flights and a total of 70,000 passengers carried. The number of miles flown aggregated 734,200 and the goods carried totaled 116,498 pounds. Up to the end of March, 1920, there had been more than £200,000 worth of imports and exports carried by air. There were 114 aerodromes licensed and 519 machines registered for civil flying during the year. In many cases salvaged military and naval planes were used.

The British Air Ministry was alive to the necessity of developing aviation and the airplane industry and accordingly announced a series of valuable prizes for encouraging improved design and development of efficient machines, both airplanes and seaplanes. The first prize for the large aeroplane was not awarded as the Judges' Committee considered that the results of the Competitions for aeroplanes showed collectively less radical advance in general design than had been anticipated, and that though very useful developments in detail design have been produced, which in themselves justified the Competitions, the award of the full prizes originally specified was not warranted. The following sums were awarded:

(a) *Large aeroplane class*

First Prize	Not awarded
Second Prize—Messrs. Handley-Page Transport Ltd., H.P.W. 8, fitted with 2,450 h.p. Napier "Lion" engines	£8,000
Third Prize—Messrs. Vickers Limited, Vickers Vimy Commercial, fitted with 2,350 h.p. Rolls-Royce "Eagle 8" engines	£4,000

(b) *Small aeroplane class*

First Prize—Messrs. Westland Aircraft Works, Westland "6-seater," fitted with 450 h.p. Napier "Lion" engine	£7,500
Second Prize—Messrs. Sopwith Aviation & Engineering Co., Ltd., Sopwith "Antelope" fitted with 180 h.p. Wolseley Hispano "Viper" engine	£3,000
Third Prize—Messrs. Austin Motor Co., Ltd., Austin "Kestrel" fitted with 160 h.p. Beardmore engine	£1,500

Late in the year and after transporting some 5000 passengers and carrying mail between London and Paris, the Airco Company found itself compelled to abandon operations.

Other commercial ventures in the way of European passenger services suffered in similar fashion but the reason assigned was the prevailing uncertainty and commercial depression rather than technical shortcomings.

GORDON BENNETT COMPETITION. First place in the annual competition for the James Gordon Bennett trophy held at Etampes, France, on Sept. 20, 1920, was won by Sadi Lecoq, flying in a Nieuport monoplane with a 300 h.p. Hispano-Suiza motor. This distinguished French aviator covered the course of 300 kilometers or 186.3 miles in 1 hour 6 minutes 17.2 seconds, making the first 100 kilometers in 21 minutes 36.6 seconds, which, however, was done by Kush of France also in a Nieuport in 21 minutes 29 seconds. But one other competitor besides Lecoq was able to finish the race. Captain de Romanet, also of France, who accomplished the distance in 1 hour 39 minutes 53.4 seconds. There were two American entries, Howard M. Rinehart and Maj. R. W. Schroeder, United States army, who flew in a Dayton-Wright monoplane and a Verville-Packard machine respectively. Both were forced to abandon the race soon after starting on account of mechanical troubles. F. P. Raynham, the sole British contestant, was forced to withdraw after going around the first lap. This was the third successive time that the Gordon Bennett Cup was won by France.

PULITZER TROPHY CONTEST. Forty-four airplanes of American, French, British, Italian and German design were entered in the race for the Pulitzer Trophy which was flown on Thanksgiving Day, Nov. 25, 1920, around a triangular course of 33 miles at Mineola, L. I. The entire distance was 132 miles, and 34 machines of the seven flights of starters were in the air at once, the entire competition taking place without a single serious mishap. The race was won by Capt. C. C. Moseley, United States Army Air Service, in a Verville army racer, his time being 44 minutes 29.57 seconds, or an average speed of over 3 miles a minute for the entire distance. The Verville army racer was driven by a 600 h.p. Packard motor which was a variation of the Liberty motor. Second place in the competition was taken by Capt. H. E. Hartney in a Thomas Morse American machine with an elapsed time of 47 minutes 00.03 seconds, and the third fell to Albert Acosta in a S.V.A. Italian airplane with an elapsed time of 51 minutes 57.62 seconds.

The summary of winners of the first 10 places in the contest for the Pulitzer Trophy and the Valentine Liberty Bond prizes, aggregating \$5100, follows below. The Valentine prizes were awarded for the elapsed time winners with a particular type of aeroplane.

PULITZER TROPHY

No.	Aeroplane	Pilot	Time
1—	Verville (Am.), Lt. C. C. Moseley, U. S. A.		44: 29
2—	Thomas Morse (Am.), Capt. H. E. Hartney, U. S. A.		47: 00
3—	Ansaldo S. V. A. (Ital.), Albert Acosta, civilian		51: 57
4—	Oreco (Am.), Lt. St. Clair Street, U. S. A.		52: 27

COMMITTEE INVITATION

1—Capt. H. E. Hartney, U. S. A.	47:00
2—Lt. St. Clair Street, U. S. A.	52:27

Captain Moseley established an unofficial world's record for straightaway speed by making 200 miles an hour on three different occasions during his flight.

Captain Moseley's average speed for the 135 miles was 178.6 miles an hour, which became the official world's record for closed circuit racing.

INTERCOLLEGIATE AIRPLANE COMPETITION. The first intercollegiate airplane meeting was held at Mitchell Field, Mineola, N. Y., with Yale University winning first honors, scoring first place for height, in a 25-mile-cross-country race, and for general performance. G. W. Horne was winning pilot in the cross-country race and the time was 16 minutes for the distance. Planes representing Yale, Pennsylvania, Pittsburgh, Cornell, Columbia, Williams, Harvard, Lehigh and Wesleyan participated. Second and third places were won by Lehigh and Cornell respectively, the University of Pennsylvania finishing in second place but disqualifying through a technicality.

UNITED STATES ARMY ALASKAN FLIGHT. A 9000-miles flight from Mitchell Field, New York City, to Nome, Alaska, and back was made in the summer of 1920 by four De Haviland 4-B airplanes of the United States Army Air Service under command of Capt. St. Clair Street, United States army. The flight was begun on July 15, 1920, and the round trip consumed 45 days, being negotiated in a series of flights of about 300 miles each or four or six hours daily of flying, the total flying time being 112 hours. Most of the country traversed was well mapped with suitable landing fields and for that portion of the flight across Canada the Dominion government facilitated landing, fuel and other conveniences and necessities. The objects of the flight were to establish a route to Asia across the American continent for military or other purposes and to furnish to the United States Geological Survey photographs of an area of Alaska north of the 66th parallel between Fort Hamlin and the Arctic Circle. This included the upper Yukon flats and its survey by ordinary topographic methods would have cost at least

\$10,000 and required 3 years, while it was demonstrated that this same area could be photographed in some 10 hours or three days flying at an approximate cost of \$1500, and a photograph in some 10 hours or 3 days by the usual topographic methods in the brief time available each year. Finally an important object of this long-distance flight was thoroughly to test the Liberty motor and the new Gallaudet remodelled De Haviland 4-B plane. This was an improvement on the De Haviland plane built during the war for the American Air Service, and lessened the danger materially by placing the pilot's seat in the rear of the gasoline tank instead of between the tank and the motor as in the older models, where in case of fall the pilot was likely to be crushed. The trip was completed on October 20th at New York and on the following day the squadron flew to Washington where it was welcomed at Langley Field, Va., by General Pershing and General March, Chief of Staff. There were four officer pilots, one photograph officer and three sergeants who were expert mechanics.

SPEED RECORDS. During the year 1920 faster travel by airplanes was achieved, and on December 12th Sadi Lecoq, who as noted above had won the Gordon Bennett Trophy for 1920, broke the world's aeroplane record for 4 kilometers (2½ miles). In a flight at Villa Coublay, Lecoq negotiated the distance in 46 seconds, or at the rate of 194.5 miles per hour. Lecoq found as did Moseley that a speed in excess of 200 miles an hour was possible, for on Dec. 16, 1919, covering a distance of 1 kilometer at the rate of 190 miles an hour he was able for some seconds to reach a speed of 226 miles an hour.

Gradually flights of longer duration were being accomplished and on June 4, 1920, Lieutenants Bossoutrol and Bernard, flying from Etampes, France, were in the air continuously for 24 hours 10 minutes and 7 seconds. This record was made in a Farman Goliath airplane.

AIRPLANE ALTITUDE RECORD. A new world's record for altitude was made on Feb. 27, 1920, at McCook Field, Dayton, Ohio, by Maj. R. W. Schroeder, Air Service, United States army. Flying in a Le Pere biplane Major Schroeder ascended to a height of 36,020 feet, over 6.8 miles, a record that after due consideration was officially certified to by the Aero Club of America as 33,113 feet. An estimated temperature of 67 degrees below zero was encountered at the high altitude and the aviator suffered from the extreme cold. His eyes froze, and, becoming unconscious, he lost control of the plane and fell rapidly, recovering at about 1500 feet above ground and in time to make the descent in safety. Major Schroeder after medical attendance fully recovered from his extraordinary experience. On May 27th a Dayton-Wright Aerial Coupe carrying four persons reached a height of 19,700 feet, while a German all-metal monoplane carried eight passengers to a height of 2200 feet.

PARACHUTE RECORDS. Increased attention was paid during 1920 to the use of parachutes for descending from airplanes as well as balloons and to securing increased safety in case of mishap. Notable height records were made during the year and a remarkable achievement was that of Lieut. A. G. Hamilton, Air Service, United States army, who on August 12th

fell 20,900 feet in 12 minutes, establishing a new altitude record.

Lieutenant Hamilton jumped from a La Pere plane piloted by Lieut. P. H. Downes, at Carlstrom Field, Arcadia, Fla. The previous "high jump" record was 19,800 feet, made by Lieutenant Krug in Texas.

AIRSHIPS AND DIRIGIBLES. The part played by airships in the World War was discussed by Admiral Scheer of the German navy in his book, entitled *The German High Sea Fleet in the World War*. The admiral stated that at the outbreak of the war the German navy possessed three Zeppelins, each of 15,000 cubic meters capacity, but as the war progressed this number was increased to 67, 17 of which were lost due to enemy action, 34 were accidentally destroyed, and six were captured by the enemy. This left 10 airships available at the armistice. The ships were not all of the same type but differed in size, continually increasing in their dimensions. Type L-50 had a volume of 55,000 cubic meters, five engines of 260 h.p., a speed of 110 kilometers per hour, and a useful load of 38 tons. In type L-70 the volume was increased to 62,000 cubic meters, seven engines were fitted, and the useful load increased to 43 tons at 130 kilometers per hour. The armament also developed during the war and while the first airships were armed with machine guns, the later types also carried a 2-cm. gun. The crew numbered 20 to 25 all told.

It soon became evident that owing to the rapid development of the aeroplane, the airship was useless on the Western Front and its main service was with the German fleet, and in air raids on England. The last of these air raids took place Aug. 5, 1918, when the L-70 was shot down.

One of the misunderstandings following the Treaty of Versailles concerned the turning over by Germany of its fleet of airships. These were to be distributed among the various nations and all allotted actually were turned over in 1920 except that given to Japan, which after being studied by Japanese officers, was to be shipped in small parts. Three Zeppelins were wrecked by German soldiers during the Armistice week and these too figured in the discussions. America was to have received a Zeppelin, but not participating in the reparation settlement this aircraft was assigned to Italy.

During the year the Zeppelin dirigible L-72 was delivered to France by Germany.

The first proposed designation, "DR-1," was not in accordance with French practice, which assigned names to airships, and accordingly it was renamed the "Dixmude," in recognition of the magnificent work of the French marine fusiliers in defence of that town in October and November, 1914.

Italy also received her share of the Zeppelins and the "L-120" on November 19th left her station at Seerappen, Koenigsberg, for Stolpe in Pomerania, where she was turned over to representatives of Italy. The hangar at Seerappen also was assigned to Italy; to be taken down, transported to Milan, and reerected there to house the "L-120." A duration record of 105 hours was claimed for this airship. Italy also secured from Germany the "L-61" and it was reported that previous to making the voyage to Italy, the "L-61" carried 85 passengers during a trial trip lasting 10 hours at a height

of 2500 meters. The journey from Friedrichshafen to Rome took 12 hours, and to cross the Alps the airship had to rise to 3500 meters. On arrival at Rome it was found that the shed provided was only 15½ inches higher than the airship, but the vessel was docked without mishap.

In Great Britain the completion of the huge dirigibles under construction aroused interest particularly the R-80 which, except for its Wolsley-made Maybach engines, was an all-British design and not as in the case of R-33 and R-34, a copy of Zeppelins. The R-80, while smaller than the R-34 class, had greater speed, which represents an advance in design. These two airships are compared with R-38, which Great Britain built for the United States in the accompanying table.

	R-80	R-34	R-38
Volume (cu. ft.)	1,250,000	1,980,000	2,720,000
Length (ft.)	530	648	695
Diameter (ft.)	70	78	87
Gross lift (tons)	382	59	78
Horse power	960	1,250	2,000
Engines	4 280-h.p.	5 Sunbeams	6 Sunbeams

	Wolsley		
	Maybachs		
Speed max. (m.p.h.)	65	62	72
Speed cruising	50	45	54
Range (miles)	6,500	...	9,000

The R-80 was provided with two streamline cars and a longitudinal gangway connecting them. There was means of egress to the top of the ship where there was a gun platform. The hull was divided into 15 gas containers with transverse partitions, and the transverse section of the hull was 21-sided. The chief features in which the R-80 was considered an advance on previous airships were: abolition of string netting; lighter and less permeable gas bags; increase in aerodynamic efficiency, strength and rigidity by improvements in the form of the cars; improved arrangement of controls; reduction of head resistance by installation of sliding radiators.

The trial flight of R-80 took place on July 19th from Walney Island, Barrow.

The United States airship R-38 referred to above was practically completed during 1920 at Bedford, England, and it was anticipated that its trip to the United States would be made in May, 1921, at which time the hangar at Lakehurst, N. J., would be ready to receive the giant dirigible. With the completion of the Lakehurst hangar, the United States would be in the position to construct airships similar to the R-38. The English hangar in 1920 was the only one in the world in which such a large dirigible could be built and its dimensions were exceeded by that at Lakehurst. In addition to the items in the table the following figures of the R-38 are of interest: Length, 694.5 feet; diameter, 85.5 feet; useful lift, 45 tons; fuel capacity, 32 tons (13 tons available for freight, personnel, etc.); consumption per hour, 180 gallons; cruising radius, 5600 knots; speed, 60 knots; speed, cruising, 50 knots; complement, 6 officers, 19 men; motors, 6 Sunbeam Cossack, 350 h.p.; gas volume, 2,724,000 cubic feet hydrogen; dead weight, 33 tons. The R-38 took part in the celebration attending the return of the Prince of Wales, flying over London. An American crew which had been sent to England to bring back the airship handled the craft.

The largest dirigible actually in use in the United States Air Service in 1920 was the French-built airship "Zodiac," officially known as ZD-1. She was 300 feet in length and ordinarily carried a crew of 3 officers and 10 men. A somewhat smaller airship but of American construction was the United States army airship, D-2, which completed its test at Akron, Ohio, and successfully made the flight from that point to Langley Field via Pittsburgh on October 31st, a distance of 444 miles. The ship, constructed for the government by the Goodyear Tire and Rubber Company, has a gas capacity of 190,000 cubic feet. The dimensions are: Length, 198 feet; height, 58 feet; width, 51 feet 3 inches. It has a cruising radius of 550 miles, which may be extended to 790 when running at half-speed, and an altitude distance of 8500 feet. The ship was fitted with two engines of the Union vee type of 120 h.p. each and making 1400 revolutions per minute.

The D-2 was used for training purposes at Langley, and at the Aberdeen Proving Grounds for bombing work.

THE INTERNATIONAL BALLOON RACE. The annual international competition for the Gordon Bennett Trophy started from the balloon field, North Birmingham, Ala., October 23rd. The field was made up of eight large spherical balloons, including the Pilot, with representatives of the two daily papers, and the Birmingham Chamber of Commerce balloon, piloted by Roy Donaldson. The big bags were filled with the by-product coke gas from the Sloss Sheffield Steel and Iron Company and the balloons ascended in a mild northwest breeze. The Pilot started at 4.15, and 4 to 10 minutes later the others started.

First place in the competition was achieved by the Belgian balloon "Belgica," in charge of Lieutenant De Muyter and Lieutenant Labrousse, which landed at 9.30 A.M., October 25th, at North Hero Island, Vermont. The distance covered was estimated at 1100 miles, which however, was less than the American record of 1173 miles, made by Alan Hawley and Augustus Post, in the International event in 1910. Lieutenant De Muyter, pilot of "Belgica," explained that his landing was forced because he was out of ballast. In its flight the balloon crossed over the Great Lakes, reaching a maximum height of 20,000 feet, at which a heavy snow and rainstorm was encountered.

Second place was achieved by the American balloon "Kansas City II," with H. E. Honeywell and Jerome Kingsbury. This balloon landed at Tongue Mountain, Lake George, N. Y., and its journey covered more than 1000 miles.

Third place went to the Italian entry, with Major Valle as pilot, which, after forty-eight hours in the air, within twenty-six minutes of the American record, made by Clifford B. Harmon and Augustus Post in a national race in 1909, landed near Homer, N. Y.

The "Goodyear II," with Ralph Upson pilot, was fourth for distance, landing at Amherstburg, Ont., across the river from Detroit, being forced down by a heavy snowstorm encountered at 20,000 feet. Its record was 675 miles, and the descent was made at 2.10 P.M. on Oct. 25th.

Fifth in the competition was the French balloon piloted by Capt. Louis Hirschbauer with Leo C. Nathan, aid. It descended at Mason City, Ill., 675 miles distant.

Sixth place went to the U. S. army balloon piloted by Lieut. R. E. Thompson, with Capt. H. E. Weeks aid. It traveled 622 miles to Charforce, Mich.

NATIONAL BALLOON RACE. This contest for 1920 was started from Birmingham, Ala., on September 25, and was won by H. E. Honeywell of St. Louis flying the balloon "Kansas City II," which accomplished a flight of 700 miles, landing at Thamesville, Ont. Dr. J. Kingsberry accompanied Honeywell as aid. The second longest flight was by U. S. Army Balloon No. 1, with Lieut. Richard E. Thompson, pilot, and Lieut. Harold E. Weeks, aid. They landed near Ridgetown, Ont., a distance of 690 miles. Third in the competition was "Good-year II," Ralph H. Upson, pilot, and W. T. Vann Ormann, aid, with a landing near Amherst, Ont., a distance of 620 miles. The fourth was the U. S. Navy Balloon, Lieut. Raabe Emerson, pilot, and Lieut. Frank Sloman, aid, which landed near Graytown, Ohio, 610 miles. The fifth balloon had as its pilot J. S. McKibben, and Allen O'Neill as aid, landing near Vanwert, Ohio, 550 miles away. The sixth balloon, "Ohio," had Warren Rasor as pilot and Herbert Rasor as aid, and landed near Grayville, Ill., 350 miles distant. Seventh was U. S. Army Balloon No. 4, Capt. Dale Mabry, pilot, and Lieut. G. W. McEntyre, aid, and it landed near Lewisport, Ky., 300 miles. The eighth balloon, with R. F. Donaldson as pilot, and C. T. King as aid, landed near Owensboro, Ky., 300 miles. Ninth came the balloon "Elsie Delight," A. Leo Stevens, pilot, E. B. Weston, aid, landing near Drakesboro, Ky., 280 miles. Tenth was U. S. Army Balloon No. 2, pilot Lieut. Byron T. Burt, aid Lieut. R. M. Olmstead, landing near Hanson, Ky., 275 miles. The eleventh balloon, with pilot Bernard Von Hoffman, landed near Caneyville, Ky., 275 miles.

FLIGHT OF NAVY BALLOON A-5598. A free balloon flight that aroused considerable interest towards the end of the year was that of the U. S. navy spherical balloon or aërostat, A-5598, which left the naval air station, Rockaway Point, N. Y., on December 13, 1920, in charge of Lieut. Walter Hinton, a veteran of the Transatlantic flight of 1919 in NC-4, with Lieutenants Louis A. Kloor and Stephen A. Farrel as associates. On leaving Rockaway the balloon went in a northerly direction and was last reported as sighted eight hours later on the night of its departure at Wells, N. Y., and while there were rumors of its being seen at other places nothing was heard positively until a dispatch came through several weeks later announcing the descent of the balloon in the St. James Bay District of Ontario, about 800 miles from the point of ascent and in a direction slightly west of north. At the time the balloon started there was only a fresh breeze blowing but as it proceeded north the wind freshened so that a gale was blowing by the time northern New York was reached. In reporting their safe descent the officers in charge stated that they were driven by a storm, late on December 13th, west by north, at lower Hudson Bay, and were forced to land 2 P.M., 12-14, about ten miles north by east of Moose Factory, Ontario, at latitude 51.50, longitude 81.00. The party of three was lost in the forest four days, but finally reached safety and

food at a Hudson Bay Co. post. The only available means of transportation to railroad was by dog sled, requiring about nine days.

Various searching parties had been organized to look for the missing balloon and considerable interest was aroused by its flight.

AIRPLANE PHOTOGRAPHY. During the world war airplane photography was highly developed by the aerial observers and military engineers of the various armies so that much in the way of practical experience to be used in water and land surveying and mapping was available at the close of hostilities. There were carried on in 1919 and 1920 by the U. S. Coast and Geodetic Survey in cooperation with the military and naval air services elaborate trials of the new methods and it was stated that with proper development this manner of surveying was of the greatest advantage for the rapidity, economy and minuteness of detail thus secured. In fact aerial photography made possible an early and complete revision of the shore topography in the Coast Survey Charts, and tests made along the New Jersey coast with various instruments and methods showed how readily and economically this could be done, especially on a coast where the shore line is subject to frequent changes due to the action of the sea. Experiments were also carried on in the field of aerial photo-hydrography, where conditions were much more difficult than in merely securing topography data. In the existing state of photography the results are not as promising and the photographs made from the air in the experiments supplied little positive information either as regards depths or bottoms that would give hope for the elimination of field work. However future developments in photography might result in improvements that would furnish comparative, positive, and critical data comparable with that obtained by ordinary sounding. This last work was undertaken on the Florida coast where the waters are clear and where it is desired to mark the small coral heads and pinnacles that are such a danger to navigation.

THE U. S. AERIAL MAIL SERVICE. In his *Annual Report* to Congress, Postmaster Burleson claimed that the Aerial Mail Service had operated during the year with increased efficiency, increased saving in car space, and greater expedition of the mail through the extension of the mail to additional commercial centres. He stated that there were on hand in the United States thousands of planes obsolete for military purposes but which could be adapted to the carrying of the mails and which would be ultimately rendered useless through deterioration in storage if not put into service by the Post Office Department. Mr. Burleson referred particularly to the creation of types to carry greater loads at less expense and with longer cruising radius, so as to eliminate intermediate stops for gassing. The greatest advance in this direction, he stated, had been made in Germany, and the Post Office Department, together with other governmental activities, had purchased some of these imported planes for thorough testing in daily operation. The planes were all metal, built of a light aluminum alloy, and would carry 1000 pounds commercial load with 240-horse power motor. They had a cruising radius of six to seven hours on low-grade fuel, as against the salvaged war planes in the

Mail Service which carried 400 pounds of mail with 400-horse power engine and had a cruising radius of three hours with high-test gasoline.

Mr. Burleson believed that such new types of airplanes offered a solution for commercial work by reducing the cost of operation probably 50 per cent. Their introduction into the United States already had turned the attention of American manufacturers to the building of planes of greater economy of operation, and their tests by the air mail had furnished information that would enable the Post Office Department to utilize some additional discarded war-training planes. The salvaged war planes being prepared for the mail service would carry 600 pounds of mail with 240-horse power motor and have a cruising radius of five hours. The utilization of these planes would cut the operating cost about 40 per cent.

Postmaster-General Burleson also reported that in addition to the direct operation of the transcontinental air-mail route, referred to below, and its feeder lines, the Post Office Department had let a contract for carrying the mail by seaplane between Key West and Havana and by land plane on the following three routes:

(A) Between New York and Atlanta, via Washington, Raleigh, and Columbia, a distance of 815 miles.

(B) Between Pittsburgh and St. Louis, via Columbus, Cincinnati, and Indianapolis, a distance of 600 miles.

(C) Between New York and Chicago, via Harrisburg, Pittsburgh, and Fort Wayne, a distance of 735 miles.

It was claimed that the mail in each of these cases would be expedited by from 12 to 16 hours, and the contracts for the land routes on advertisements for bids were let at prices within the amounts that would be saved on transportation of these mails by railways. A contract was let from October 15, 1920, to June 30, 1921, for an airplane mail route from Seattle to Victoria, British Columbia, to connect with the steamer leaving Vancouver on the previous day for the dispatch of between 12,000 and 14,000 letters to the Orient with a saving of time equal to the elapsed time before the departure of another steamer.

The Post Office authorities found that the establishment of air mail routes would result in a great saving of time but in many cases the cost of transportation would be greater than by train. The Postmaster General recommended that in the interest of improved service the law should be amended so as to permit the making of contracts for carrying mail by airplane, even at increased cost over train service, considering the commercial benefits to be derived from the greater expedition of mail. In addition to amending the law so as to permit of a more liberal contract service Mr. Burleson urgently recommended that the system of government air routes be extended as follows: Boston to Detroit, via Buffalo; Chicago to Los Angeles, via Kansas City; St. Paul-Minneapolis to Seattle; and St. Louis to New Orleans, via Memphis.

Congress, however, had provided in its legislation that the cost of transporting mail by airplane must not exceed the expense of train carrying and this restriction, it was claimed, prevented

the expediting of the mail over a number of important proposed commercial routes.

In connection with considerable advance made in the aerial mail service in 1920, it may be remembered that regular service had been carried on only since May 15, 1918. The first route was between New York and Washington, a distance of 218 miles. The routes between Cleveland and Chicago, and New York and Cleveland, were established in 1919, the route between Chicago and Omaha on May 15, 1920, the route between Chicago and St. Louis on August 16, 1920, and the route between Chicago and Minneapolis on September 1, 1920. In the two years and three and a half months ended September 1, 1920, the U. S. Air Mail operations covered 957,108 miles of flying. In that time it carried 38,027,440 letters. The cost of operation, including interest on investment, total or partial wrecking of planes, replacements of damage to planes, death and injury compensation, etc., had been \$1,147,926.26 for 2¼ years, or \$1.18 per mile. More than one-third of this cost of operation was not cash expenditure but represented the original cost to the army and navy of surplus war material which the Post Office Department put to use in carrying the mails. By the aerial service first-class mail had been advanced in delivery to the public 18 to 24 hours. At the end of 1920 there were about 35 mail planes in the air each day.

TRANS-CONTINENTAL AERIAL MAIL. The first trans-continental aerial mail flight, marking the inauguration of regular service, began on September 8th, when a mail-carrying airplane left Mineola Field, New York. The trip was completed when airplane No. 151 of the United States Aerial Mail Service landed at Marina Field, near the Presidio, San Francisco, on September 11th. The last 250 miles of the trip from Reno, Nevada, were accomplished in one hour and fifty-eight minutes, and thereby broke all previous records for the same distance. As soon as the pilot landed, the six bags of mail were put on an automobile truck for distribution at the main post office at San Francisco. Two bags of aerial mail left were forwarded on the four o'clock train for Washington, and one for Oregon, while the other three remained in California.

On September 10th, the first transcontinental postal airplane for the East, with 700 pounds of mail, cleared from the Marina Field, San Francisco, at 6.15 A.M., being due to arrive in Salt Lake at 3.31 P.M., mountain time, the same day, and at the Mineola Field, New York, at 4 P.M., September 12.

With the inauguration of the through Trans-continental Air Mail the American Air Mail Service was extended over 1463 miles of new territory, with the practical advantage of reducing the transit time of mails between New York and San Francisco from 91 hours to 57 hours in the winter months, and to 54 hours in the summer. Preparations were being made for night flying over the plains between Chicago and Cheyenne, and this would reduce the time of transit of the Air Mail to 45 hours against 91 hours by rail.

The Trans-continental Air Mail Service as arranged during 1920 started daily from New York and San Francisco simultaneously at 5.30 A.M. local time on the summer schedule, and 6.30 A.M. winter basis. The equipment con-

sisted of J. L. metal monoplanes with a cruising radius of 10 hours at 90 miles an hour between New York and Omaha, flying with a single stop for gassing at Chicago, and of De Haviland-4 planes for the remainder of the trip. These airplanes with four hours' fuel and oil, at 80 miles per hour, were used between Omaha and San Francisco, and gassing stations were provided approximately 200 miles apart.

As showing the satisfactory progress made in actual flying in the air mail service it may be stated that on December 2nd all records for flying between Chicago and New York were broken. On the eastern trip J. T. Cristensen, leaving Chicago at 6.55 A.M., flew to Cleveland, 319 miles, at the rate of 117 miles per hour, and W. L. Smith flew from Cleveland to New York at the rate of 151 miles per hour, arriving there at 1.25 P.M. The actual flying time between Chicago and New York, 742 miles in a direct line, was 5 hours and 31 minutes, and an average speed of 131 miles an hour was maintained. The fastest train time was 20 hours. In these flights De Haviland single-motored planes were employed, a change of plane being made at Cleveland.

HELICOPTERS. This type of machine for aerial flight, where lifting screw propellers revolve about a vertical axis, the idea of which dates back to the time of Leonardo da Vinci, attracted interest during the year 1920 in both America and Europe. Experiments continued on the Hewitt-Crocker Helicopter, referred to in the *YEAR BOOK* for 1919 under *Aeronautics*, and on August 24, 1920, U. S. patents Nos. 1,350,454, 1,350,455, and 1,350,456 were issued. The inventors claimed that a lift of more than 20 lbs. per horse power was obtained in their experimental machine and that this was adequate to make the helicopter successful for general as well as special aerial service. The experiments described in some detail will be found in the *Aerial Age Weekly* for Nov. 22 and Nov. 29, 1920.

Experiments with the Helicopter were not confined to the United States and late in the year it was announced that a machine on which Mr. Louis Brennan, the inventor of the mono-rail gyroscopic train, has been experimenting at Farnborough, with the aid of the British government, for more than a year was to be officially tested.

It was rumored that Mr. Brennan would receive an unprecedented reward if his invention proves successful.

With such work in progress it was not strange that when a French inventor, M. Demblanc, read a paper on the helicopter before the British Royal Aeronautical Society it should arouse much interest. Mr. Demblanc stated that increased safety would be secured inasmuch as in case of engine trouble the propellers could be detached to operate as an air brake. In addition experiments on helicopters with government aid were reported from Italy.

AEROPLANE. See *AERONAUTICS*.

AEROSTAT. See *AERONAUTICS*.

AFGHANISTAN. A country of Asia between parallels 29° and 38° north latitude and 61° and 72° east longitude, with a long narrow strip extending to 75° east longitude. On the west is Persia, on the east tribal districts under the Government of India, on the north Russian territory and Bokhara, and on the south

British Baluchistan. The boundaries on the east and south, however, are uncertain, though the basis of settlement in respect to them was reached in 1893. The area is estimated at 245,000 square miles, and the population at 6,380,500. Capital, Kabul, with a population of about 160,000. Other large cities: Kandahar (31,500) and Herat (20,000). The dominant race is the Afghan, whose two chief tribes are the Durrani and the Ghilzais, the total number being variously estimated at from 2,200,000 to 3,200,000. Lesser groups are the Tajik, Hazara, Aimak and Uzbek. The languages are Persian and Pushtoo and the predominant religion is Islam, most of the people and the ruler belonging to the Sunni division of Mohammedans. Despite the wide extent of mountainous country, there is a considerable area of cultivation, the numerous plains and valleys being very fertile. Agriculture and grazing are the chief occupations. There are two harvests. The chief products are wheat, barley, millet and other grains; a great variety of fruits which are produced in abundance and also a plentiful growth of the castor-oil plant, madder and the asafoetida plant. Fruits supply the food of the people and are to a considerable extent exported. The raising of sheep is very important. There is an abundant and singular variety of fat-tailed native sheep, the tail being of immense size and weight and containing large stores of fat. This sheep supplies the chief meat diet and abundant grease which is used as a substitute for butter, while the wool and skin are used for the making of wearing apparel and are also exported in considerable quantities. The mineral wealth includes copper, lead, iron, gold, and precious stones. The copper is reported to be abundant in the north. The lead deposits are scattered throughout the country. Other industries include the production of silks, carpets, felts and goods of camels' and goats' hair. In addition to these which are the chief industries, there are other manufactures for local consumption and for the army, and there is a considerable manufacture of sheepskin coats. According to Indian statistics in 1918-19 the exports into India were £1,194,000 and the imports from India were £2,020,000. The imports and exports from and to Bokhara were reported to amount on the average, respectively, to about 4,000,000 rubles. The trade with India showed a steady increase since 1914-15, owing chiefly to the removal of the heavy duties which formerly restricted it. There have been no railways and commerce takes the line of certain routes which admit only transport by camel and other pack animals, and there are scant means of water communication. Afghanistan is under a monarchy, the executive power being in the hands of the Ameer, an hereditary prince who formerly received a subsidy from the Government of India, under the treaty of 1893, but owing to the developments during the war, it was discontinued. By the peace treaty its arrears were confiscated and no further subsidy was to be granted. The total revenue has been placed at between 12,000,000 and 13,000,000 rupees, which is probably an underestimate. There is a regular army, which is supplemented by levies. Its strength has been placed at 98,000, including 18,000 cavalry and 396 guns, but this is an old estimate and there are no means for determining the precise strength at

present. The control of foreign policy is entirely in the hands of the British Government of India. The ruler in 1920 was Amanullah Khan, who came to the throne on the assassination of his father, Habibullah Khan, Feb. 20, 1919. He was born June 1, 1892.

AFRICA. For discussion, see articles on the respective countries and territories of Africa, including ABYSSINIA, EGYPT, MOROCCO, ALGERIA, TUNIS, SUDAN, BRITISH EAST AFRICA, SOUTH AFRICA, UNION OF, etc.; also ANTHROPOLOGY and EXPLORATION.

AGRICULTURAL COLLEGES. See AGRICULTURAL EDUCATION.

AGRICULTURAL CREDIT. See AGRICULTURE.

AGRICULTURAL EDUCATION. During the year 1920 the agricultural colleges of the United States began to resume somewhat of a normal status which had been rather noticeably affected during the World War. The enrolment of students had been restored to more than normal, in many instances far exceeding that of any previous year. The University of Minnesota reported that the College of Agriculture had an attendance of 650, while the school of agriculture had registered fully 700 as compared with 250 a year before. The Oregon College reported that the registration of the school of agriculture during the past year was almost 100 per cent greater than ever before. The entering class at the Kansas College exceeded that of any previous year. The Georgia College enrolled the largest number of students in the history of the institution. Relative increases are noted in other institutions of this character. There was, however, an alarming condition in the personnel of the faculty of the agricultural colleges, many of the best men and their assistants having gone into commercial or other positions. There were few men in training to fill their places. Low salaries in the colleges and experiment stations, the small increases which were offered to offset the greatly changed scale of living cost, and the increased demand for experts in industries were responsible in part for this situation. Many of the States have begun to see the inevitable result of this practice, and State legislatures have provided for increased appropriations for instruction, enlargement of the faculty and substantial increases in salaries.

To the New York College of Agriculture at Cornell University was granted the largest appropriation ever granted any State college of agriculture. It received an increase of \$300,000 over the previous year for salaries and running expenses, \$500,000 being immediately available for new buildings, while \$2,500,000 more was authorized under the building plan. The total State appropriation for the college for the year would come to about \$1,800,000.

The Louisiana legislature made a tax levy on the natural resources of the State which according to estimates would yield about \$3,000,000 per annum. While a portion of this fund went to the support of various State institutions, it was estimated that about \$1,000,000 was for the development of the College of Agriculture.

The State legislature of Maryland recently enacted a law combining the Maryland State

College of Agriculture with the University of Maryland School of Medicine under the name of the University of Maryland. An appropriation of \$42,500 per annum was made for the medical school for the ensuing biennium, and \$186,476 for 1921 and \$165,416 for 1922 for the other departments of the university, while \$203,000 was provided for buildings and equipment. A new agricultural building was erected at the University of Tennessee costing approximately \$250,000.

The report of a subcommittee on college instruction in agriculture, issued by the Bureau of Education, indicated progress in the improvement of the four-year course for agricultural students. Many agricultural colleges were planning extensive changes in the agricultural curriculum; entrance requirements were being modified; certain alterations in the elective system were under advisement and considerable attention was being given to improvement in college teaching and the equipment for this work. Among the influences found to be affecting this movement was a desire that the institution should be fully of standard college grade; to train students to meet more fully the requirements of the particular pursuits for which they were preparing; to meet new conditions in the secondary schools; to improve and strengthen the college and its relations with the preparatory schools; to observe the limitations of field practice, visual instruction, lectures, text, etc.; to test the new views of educators with regard to the development of instruction in the fundamental and related sciences from courses in practical agriculture so constituted as to create a desire in the student to know underlying facts and principles and to lead him on to study of the sciences, rather than beginning with sciences and basing instruction in agriculture on the scientific facts and principles previously acquired by the student; and to broaden the agricultural curriculum to include not only agricultural production, but also rural economics and sociology and for certain students, pedagogical training.

There was general agreement among the college authorities interviewed that during the first two years in college students should be required to take general basic courses, including a technical knowledge of what the farmer needs to know in order to carry on his work intelligently. The specialization through group courses could be undertaken at the beginning of the junior year. A great variety of arrangements in the curricula of the colleges was found as regards required and group courses and free electives. In general, a considerable limitation was placed on the student's choice of studies. The group elective system is quite common. Under this system the student is required at a certain period in his course to decide on his major subject, usually with advice from the faculty.

The committee deemed it advisable that there should be in the organization of these colleges a general officer, subordinate to the dean, who would act as a supervisor of teaching and be of coördinate rank with the directors of the experiment station and extension work. Some progress has already been made in this direction.

At the agricultural college of California, under new plans effective with the opening of the

1920 session, fewer subjects were required of all students, some work in agriculture being offered each semester and a closer relation established between the subject matter in the fundamental sciences and in agriculture. Three new courses dealing in a broad way with general principles in agronomy, animal husbandry, and horticulture, respectively, were added as electives. A new required course in botany was to be offered in which plant physiology would be emphasized, and changes would be made in the subject matter of the courses in zoölogy, agronomy, animal husbandry, and horticulture. The College of Agriculture of the University of Missouri organized a department of rural life in which were offered the subjects of rural economics, rural sociology and farm management.

Owing to the demand for colored county agents and teachers of agriculture since the passage of the Smith-Lever and Smith-Hughes Acts, an agricultural course of college grade was introduced at the Hampton Normal and Agricultural Institute, beginning September, 1920. Fifteen units of secondary work and two years of actual farm life and experience are required for entrance. The new course requires three years of 12 months each instead of four years of nine months each.

VOCATIONAL AGRICULTURAL EDUCATION. Encouraging progress in the development of vocational agricultural education during the year was evidenced by liberal State appropriations, the largely increased number of schools offering courses in vocational agriculture, and a deeper interest on the part of the students taking this work. The several States were taking active interest in vocational agricultural education.

During the past year 36 States employed full-time State supervisors; 12 States employed supervisors for part time, the increase in the number of supervisors over the previous year was 16. The total fund allotted for 1920 to the States for vocational agriculture was \$889,886.31. There were 1375 all-day vocational centres, having a total enrolment of 31,301 pupils. There were also a number of short course centres and evening classes comprising a total enrolment of about 4000 pupils. The number of teachers of vocational courses in agricultural schools was 1570. There was a shortage of teachers for vocational agriculture and with the constant changing of teachers each year it seemed evident that special attention should be devoted to the training of teachers for this kind of service.

In 1920 there were 64 institutions giving courses in teacher training for vocational agriculture, through 393 teachers and to 2310 students. In most instances the required qualifications of teachers of vocational agriculture were graduation from a four-year college course in a standard agriculture college and a certain amount of practical farm experience. Not all States have been able to maintain the above standard owing to a shortage of teachers for this type of work. The amount of Federal money expended by the States for teacher training for agriculture for the year ended June 30, 1920, was \$250,664.24.

The land-grant colleges in order to carry out the provisions of the Smith-Hughes Act were making progress in building up efficient departments of agricultural education. They had also assisted secondary schools in planning and

developing vocational courses in agriculture, in preparing subject matter, and in training teachers.

ELEMENTARY AGRICULTURAL EDUCATION. Progress is evidenced in the teaching of agriculture in elementary schools. In a number of States special appropriations had been made for rural schools. Many States now employ a full time State Supervisor for these schools. Consolidation of small rural schools in one central school has contributed a great deal toward solving problems of rural education. In the consolidated schools better facilities are provided for teaching agriculture, as well as other subjects, higher salaries can usually be paid teachers and, as a rule, more competent teachers may be procured. Many of the normal schools are offering special courses for training teachers of agriculture for rural elementary schools. Some of the agricultural high schools are also offering training courses of this kind.

The rural school curriculum is gradually becoming enriched with new material. The subject matter is more attractive to pupils. We are beginning to see that the rural school course of study should be based on what rural people ought to know. The basic subjects taught in the rural school should not differ greatly from those taught in the city school except that they should be made more applicable to farm life.

AGRICULTURAL TRAINING FOR DISABLED EX-SERVICE MEN. Pursuant to the law of June 27, 1918, with regard to the formulation of a programme of the Federal government for Vocational Rehabilitation of our disabled soldiers, sailors, and marines, it is encouraging to learn that much has been accomplished in training these men in agricultural as well as in other pursuits. According to the Federal Board for Vocational Education, the number of disabled soldiers reported as having entered some line of agricultural training to June 30, 1920, was 5397, but nearly 1000 men, classified under other headings, might be included as taking agricultural training in connection with training in other lines of study. A large percentage of the agricultural men come from rural communities and are of low educational grade. They are placed in guidance schools in elementary branches including agriculture and, although recorded as prevocational students, it seems safe to estimate that more than 25 per cent of them in prevocational work are agricultural trainees.

The Board had no schools of its own. It utilized during the fiscal year approximately 1700 educational institutions; arrangements had also been made in over 8000 shops, mills, factories, and other business places to train men in and on the job.

AGRICULTURAL EXPERIMENT STATIONS. Lack of adequate funds bore heavily on the experiment stations in the United States in 1920. During the six years from 1914 to 1920 their appropriations increased but slightly, in the case of many of them not at all, and the high costs of maintenance made any considerable expansion impossible for the most part. It became evident during the year that if the stations were to fill their proper place and keep pace with the development of institutions for teaching and for agricultural extension work among the farmers, they must receive more ample support. This was shown to be necessary not only that they might continue to grow but

that they might be able to hold their efficient investigators and attract competently trained persons to that field. Toward the close of the year steps were inaugurated to seek larger appropriations from the Federal government, and many of the States were asked to increase their allotments to the stations.

There were many losses from the working forces of the stations, and in eight States the directorship changed during the year. Several new stations were opened or were provided for.

Under authority granted by the Georgia legislature in August, 1918, a station was established during the year at Tifton, the town contributing a tract of 200 acres and \$25,000 for buildings, land clearing, and maintenance. A deciduous fruit station was established at Mountain View in the Santa Clara Valley, Cal., as a part of the field activities in pomology of the central station, for which the last legislature appropriated \$100,000 for the biennium. In Louisiana the legislature provided \$10,000 for a fruit and truck experiment station to be located in the trucking region of the State. Local parties have offered to provide the necessary land. The Louisiana Sugar Planters' Association has purchased a tract of land which it has offered to the State for the use of the Louisiana Sugar Station, now located on rented land in a city park. A tract of land near Fresno, Cal., has been set aside for a fig experiment station, to be devoted primarily to experiments in fig culture. The Virginia Truck Station, carried on for some years at Norfolk with contributed funds, has been taken over by the State, the land on which it is located being donated by the local truckers' association and increased appropriation granted by the legislature. The Pennsylvania Institute of Animal Nutrition has received a grant of \$5000 from the Rockefeller Institute for Medical Research in furtherance of its work.

A crop protection institute has been organized as a cooperative undertaking by a group of investigators of plant diseases and insect pests in association with representatives of leading industrial concerns engaged in manufacturing spraying and similar materials for combating crop enemies. The institute was organized with the advice and assistance of the National Research Council. The industrial concerns will provide the means for research in lines approved by the representatives of scientific societies on the institute's board of trustees.

The State of Minas Geraes, Brazil, has determined upon the establishment of an institution for agricultural investigation and teaching, and Prof. P. H. Rolfs, for 15 years director of the Florida Experiment Station, has been appointed to organize and conduct the new institution. An agricultural experiment station has been opened at Haina, San Domingo, with a view to promoting its agricultural interests. Several tracts of land have been accepted by the Cuban Department of Agriculture to be used for establishing breeding stations for horses, mules, cattle, and hogs. The Paraguayan government has ceded to the stockmen's society a tract of land for an experiment station devoted to livestock improvement.

The British Parliament has provided for a large increase in agricultural investigation, voting about £80,000 to the Ministry of Agricul-

ture for the maintenance of agricultural research, the bulk of which will be allotted to the various research institutions throughout the country. The war brought home the importance of fundamental research as "the only solid basis of industrial progress" and the necessity of offering sufficiently attractive emoluments to research workers to build up an adequate service. As a means of recruiting the research service, the Ministry of Agriculture has resumed the research scholarship scheme which was in operation before the war.

The Royal Agricultural Society of England has decided on account of its financial condition and the necessity for retrenchment to discontinue the experimental farm at Woburn on the estate of the Duke of Bedford, which has been under way since 1876. The Woburn experimental fruit farm, also on the estate of the Duke of Bedford and maintained through his benevolence for the past 25 years, has as a result of changed economic conditions been taken charge of by the Ministry of Agriculture and is to be continued on practically the same lines as heretofore. It is being maintained with a grant from the development fund, and has been placed under the supervision of the Rothamsted experimental station. A new laboratory building has been completed at the latter station quite largely with funds contributed by private subscription, and plans are under way for a special building for the use of the new Department of Plant Pathology and Entomology.

The British Ministry of Agriculture has purchased an estate of over 1500 acres of typical heath land in Norfolk, to be used as a national demonstration farm to show what can be done with such land by modern methods. Tobacco growing on a comparatively large scale will be one of the features of the experiment.

An institute for research in animal nutrition has been organized in connection with the University of Aberdeen and the North of Scotland College of Agriculture, under the name of the Rowett Research Institute, in honor of John Quiller Rowett, who contributed £10,000 toward the endowment of £25,000 which it is hoped to raise. The establishment of this institute is regarded as an important development in the field of agricultural research. The matter of agricultural research in the British colonies has been receiving attention and a committee has been appointed to consider whether the staff of the agricultural departments in the Colonial service is adequate and to make recommendation for their strengthening.

An Institute of Nutrition has been established at Amsterdam, Holland, under the leadership of Dr. E. C. van Leersum. Funds for buildings have been contributed from private sources and an appropriation for maintenance has been made by the government. It is reported that the Italian government has provided for the establishment at Bergemo of an experimental farm devoted to improving the culture of maize. The East African Protectorate, in connection with a scheme for the exploration and development of the resources of that country, has provided for a series of equatorial experiment stations, to be located at intervals of 1000 feet in altitude from sea level to 9000 feet.

Experimental work in agriculture and horticulture has been inaugurated on a considerable scale in the University of Nanking, China, in-

cluding the improvement of rice, wheat, and corn, culture experiments with cotton, sericulture work, etc.

AGRICULTURAL EXTENSION WORK. During 1920 the Coöperative Extension Work in agriculture and home economics carried on in all the States by the United States Department of Agriculture and the State agricultural colleges under the Smith-Lever Act of May 8, 1914, and related Federal and State legislation, settled down quite fully to a peace basis. It continued to receive in large measure the active support of the farming people, who evidently have come to consider this system of popular and practical education as a permanent factor in promoting better conditions in agriculture and country life. The high cost of personal service, travel and supplies, together with the inadequate supply of properly trained men and women, prevented expansion of the work, though the available funds were considerably increased as compared with those of the previous year. Special attention was given to marketing and other economic matters but problems connected with agricultural production, farm machinery and buildings, plant and animal diseases, farm and home sanitation, food and diet (particularly of children), clothing, home equipment and management also received much attention.

Special attention was given to the work among the farm women in order that it might be established on a permanent basis and meet the real needs of the rural homes. This was necessary because much of the work with women during the war had been distinctly of an emergency character, relating very largely to the conservation of food and the use of unusual foodstuffs. This work had been maintained so largely with emergency funds that when those were withdrawn many of the communities in which it had been established regarded it as wholly a war service and were therefore either unprepared or unwilling to contribute the funds necessary to the continuance of the home demonstration agents. This was particularly true in the Northern and Western States where for the most part such agents had only been employed as a war measure. In the Southern States where the demonstration work for women and girls had been going on much longer there was general recognition of its value as a permanent extension service. There a large number of the home demonstration agents were continued and only financial inability prevented their continuance in the counties from which they were withdrawn.

To get information concerning the actual status of the farm homes as a basis for the further development of the extension work in home economics, a survey was made of about 10,000 homes in the 33 Northern and Western States. These included a great variety of homes in typical farming communities in a large number of counties. The results of this survey were published by the Department of Agriculture. They show, for example, that the average working day of the farm women is 11 hours and that most of them have no regular vacations. The average farmhouse has eight rooms and is equipped with one or two stoves in addition to the kitchen range. About half the women have to carry into the house the coal or wood to feed these stoves and also keep the fires burning during the day. Even this equip-

ment does not keep the whole house warm as is usual in city houses. About one-third of the homes have running water in at least one room, but only one-fifth have bathtubs. More than one-third of the women have to carry water from wells outside the house. Quite generally the care of kerosene lamps is one of the duties of the farm women. Out-door toilets are used on 85 per cent of the farms. Nearly all the houses are screened. About half of the women have washing machines and carpet sweepers. Over 90 per cent do their own washing, sewing, and bread-making. The sewing-machine is used in most of the farmhouses. Only 15 per cent have power for running machinery in the house, though power is used for farm machinery on nearly half the farms. Of the women **reporting, 36 per cent help with the milking, 25 per cent with the livestock, 81 per cent care for chickens, 56 per cent largely care for the garden, 24 per cent help in the field an average of 6-7 weeks during the year, and 33 per cent make butter to sell. Only 11 per cent of those selling butter and 16 per cent of those selling eggs have the money for their own use. Nearly one-third are keeping home and farm accounts. The farm women are now unable in most cases to have hired help. Only about 14 per cent employ such help and then only for about one-third of the time.**

The comparative isolation of the farm home is shown by its being on the average about six miles distant from the high school, three miles from the church, five miles from the market, five and one-half miles from the doctor, 12 miles from the trained nurse and 14 miles from the hospital. This is overcome to a considerable extent by the use of the telephone in 72 per cent of the homes and of the automobile on 62 per cent of the farms.

This survey indicates that the outstanding problems which the extension service for farm women should deal with are: (1) Shortening the working day of the average farm woman, (2) lessening the amount of heavy manual labor she now performs, (3) bringing about higher standards of comfort and beauty for the farm home, (4) safeguarding the health of the farm family, and especially the health of the mother and growing child, and (5) developing and introducing money-yielding home industries where necessary in order to make needed home improvements. To solve these problems immediate efforts should be made: (1) to introduce improved home equipment, especially running water and power machinery and more efficient methods of household management, including rearrangement of kitchens and installation of better heating systems; (2) to help farm people to understand and apply the laws of nutrition and hygiene, through demonstrations in child care and feeding, food selection for the family, home nursing, and the installation of sanitary improvements; (3) to show farmers and their families that investments promoting the comfort, beauty, health and efficiency of the farm home are wise and productive expenditures and very likely the only means of keeping the young people on the farms.

The movement for the more complete organization of the farming people to support the coöperative extension work and to promote the economic and social interest of agriculture and country life continued in 1920 with increasing

strength. The national organization of farm bureaus, entitled the American Farm Bureau Federation, perfected a permanent organization at Chicago in March and held its second annual meeting at Indianapolis in December. At this meeting 32 State Federations of Farm Bureaus were represented by 65 voting delegates. In 13 other States county farm bureaus have been organized to a greater or less extent and in a number of these States federations are being formed. About 1,500,000 members are enrolled in the county farm bureaus. Women are being more generally welcomed to membership in the farm bureaus and already have representation in State and National federations. In some counties boys and girls may also be members of the farm bureau or through their clubs are closely affiliated with it.

As regards commercial activities the general policy of these organizations is now to commit such activities to separate organizations specially formed for such purposes. The farm bureaus are thus becoming organizations in the field of agriculture analogous to chambers of commerce in their relations to other industries.

In 1920 the American Farm Bureau Federation was largely engaged in organizing and strengthening the county farm bureaus. It also dealt with a number of legislative matters pending in Congress. A study of the problems connected with the transportation of agricultural products was undertaken. A conference of representatives of a number of agricultural organizations led to the appointment of a committee of seventeen members to consider and report on the marketing of grain. Similar committees on the marketing of livestock and vegetable crops are being formed. A bureau of farm economics and statistics was established and coöperation with the Bureau of Crop Estimates and Markets of the Department of Agriculture was begun. A special committee undertook the study of tax problems as related to agriculture. In these and other ways the Federation is attempting to investigate the broad national questions relating to agriculture and country life and to interpret the results of similar studies by governmental agencies to the farmers throughout the United States. The main office of the National Federation was located in Chicago, with a branch office in Washington. Mr. J. R. Howard of Iowa was reelected president of the Federation at the Indianapolis meeting.

During 1920 agricultural agents were employed in the coöperative extension work in about 2000 counties, home demonstration agents in about 800 counties, and paid leaders of boys' and girls' club work in about 300 counties. There were also about 750 extension specialists in the various branches of agriculture and home economics who went out from the agricultural colleges to supplement the work of the county agents. Including the supervisory officers and their assistants, about 5000 persons were engaged in extension work.

In 1919 in the 15 Southern States 246,982 adult farmers conducted demonstrations under the supervision of the county agents on 2,664,723 acres. The largest acreage was with corn, 645,716 acres, with an average yield of 37 bushels per acre, or more than double the average yield of the whole territory. The county agents were especially active in helping to introduce improved livestock and secure the adopting of bet-

ter methods of feeding, care and protection against diseases and pests. Tick eradication was greatly promoted and assistance given in stocking counties released from quarantine with improved cattle. The great growth of coöperative marketing and purchasing in the South has been one of the most marked results of extension work. County agents, assisted by marketing specialists, through demonstrations and by instruction and advice aided local and county associations of farmers in the coöperative selling of all kinds of farm produce and livestock and in the coöperative purchasing of a great variety of farm necessities. The Bureau of Markets and State Department of Agriculture coöperated with the extension division of the agricultural colleges in this activity. The value of the products coöperatively purchased or sold through the coöperative efforts during 1919 was \$34,534,886, representing a saving to the farmers of \$4,547,418 or 13 per cent. In Texas alone coöperative work in cotton grading, classing and stapling together with the information given by extension agencies as to the market value of various grades and staples, gave the farmers increased returns aggregating more than \$1,000,000.

Increased interest was manifested in extension work among the negro population both by the white agents and also by a special force of about 150 negro agents employed in counties with a large negro population. This work was more thoroughly organized and provision was made for its general supervision by two field agents attached to the Washington office. Three conferences of both the white and negro State and Federal leaders were held during the year which resulted in a better understanding of the importance and needs of this work and much encouragement to the workers. The negro agents have not only aided their people along agricultural lines but have also helped to quiet unrest among them due to unwise agitation on economic and social matters.

In the Northern and Western States the county agents made 510,000 farm visits and 1,412,200 farmers called at the agents' offices. They held 81,156 meetings which were attended by 3,580,000 people. About 65,000 demonstrations incident to crop and livestock production were conducted on farms, with a resulting profit due to increased production of over \$19,000,000. Under direction of the agents 218,000 farmers selected the seed corn planted on 7,000,000 acres, 187,000 treated seed wheat or oats for smut. Practice relative to various crops was modified on over 130,000 farms; registered sires were secured for 40,000 farms; 163,000 animals were tested for tuberculosis; 400,000 cattle were treated for blackleg, and farmers and veterinarians vaccinated 1,372,000 hogs for cholera; 853 live-stock breeders' associations with a membership of 28,396 were organized; many live-stock shipping associations were organized and numerous auction sales of live stock were successfully conducted. The irrigation and drainage work planned and promoted by the county agents added to the tillable land of the country an area as large as the State of Connecticut. Over 30,000 farmers kept records of their business on forms furnished by the farm management demonstrators. The value of the coöperative business of farmers' exchanges and coöperative associations organized with the aid of the county agents

amounted to over \$40,000,000 with a saving of about \$5,500,000. These organizations also furnished to farmers 118,891 laborers. Much attention was given to the formation of community groups within the counties. This led in many cases to the working out of definite programmes of agricultural improvement by the farm people themselves and the development of local leaders to carry out those programmes with the assistance of the extension agents.

The work of the county women agents, commonly called "home demonstration agents," while retaining many features of the war-time work relating to food production and conservation, was materially broadened on matters relating to diet, clothing, health, sanitation, household equipment and management, and the social interests of the rural communities. Rural women are thus developing qualities of leadership and aside from membership in local clubs are taking active part along with the men in community groups and county farm bureaus or councils. In 1919 there were in the Southern States 20,323 clubs of rural girls and women, with an enrolment of about 500,000, including nearly 2000 clubs for negro women and girls with a membership of 72,000. Much attention was given to home gardening and poultry work, and the canning of the products for sale or home use. The food, including fruit, vegetables, meat, poultry and fish, canned or otherwise preserved, had an estimated value of over \$12,000,000. Many egg circles were organized and the members taught to grade and pack their eggs and market them coöperatively. Connected with such enterprises were the development of community canneries, drying plants, curb markets, rest rooms, etc. The agents also assisted in the planning or remodeling of farmhouses, rearranging of kitchens to save labor, installing of water, heating and lighting systems; introduction of home-made and purchased labor-saving devices, and beautification of the home and adjacent grounds.

In the Northern and Western States much the same kinds of work were done by the home demonstration agents. Owing to the high cost of many things used in the rural home and the lack of complete help for domestic work different phases of home management were given much attention. Instruction regarding the making of family budgets and the keeping of home and farm accounts by the women was received with much interest. The rearrangement of kitchens and the introduction of labor-saving devices were things accomplished in an increased number of farm homes. Women gave more attention to gardens, poultry and egg production and bee-keeping as means of increasing the family income. Canning as a home industry was also more widely developed. Better child feeding and the more general use of milk and its products in the farmhouse were actively promoted by the home demonstration agents. Home nursing, personal hygiene, and sanitation programmes were more numerous, often with the coöperation of health officers, county nurses and welfare organizations. In several counties in Massachusetts dental clinics in isolated rural communities were held under the auspices of the farm bureaus. In the work relating to the making, repair and conservation of clothing a notable feature was the increased use of the

skill and experience of local leaders. Community enterprises, including among other things coöperative laundries, salvage shops, recreation centres, circulating libraries, magazine circles, clean-up campaigns, improvement of church and school buildings and grounds, were fostered in large measure by the home demonstration agents. Sixty-eight coöperative buying and selling associations, with a membership of about 13,000, were formed in 1919.

In the Northern and Western States 310,115 boys and girls were enrolled in 16,395 clubs and carried on a variety of practical work in gardening, canning, growing corn, potatoes, beans, sugar beets, sorghums, pigs, poultry, sheep, baby-beef, rabbits, and making bread, clothes, etc. Much progress was made in organizing and conducting these clubs on a community basis and fitting their work into the programme adopted by the farm bureaus for the extension work with adults. In addition to the supervision given by the paid State and county club leaders, over 10,000 voluntary community leaders had direct charge of clubs. Farmers and business men are increasingly looking to boys' and girls' club work as the medium through which better practices in farming and home-making may be secured and trained rural leadership developed.

In the Southern States large numbers of girls worked with the women in a variety of projects relating to agricultural production, canning and different phases of home-making, but about 160,000 boys had separate clubs. The total production of these clubs, including those for negro boys, was valued at \$8,000,000. The average yield of corn grown by club members was 48 bushels per acre, as compared with the general average of 21 bushels in the Southern States.

Interest in the club work throughout the country by exhibits of club products and competitive contests by club teams at local, county, State and interstate fairs, encampments, short courses at agricultural colleges, observation trips to different parts of the country, etc.

Extension specialists representing various branches of agriculture and home economics with headquarters at the agricultural colleges were increased in number and their work was more thoroughly organized. They assisted the county agents in handling unusual problems, such as the growing of special crops, improvement of live stock, control of diseases and insect pests of plants and animals, dairying, poultry, marketing, keeping of farm accounts, organizations of coöperative associations, instruction and demonstrations in food and nutrition, clothing, home hygiene and sanitation, household equipment and management, etc. They also aided in the shaping up of the county and State programmes of extension work, prepared numerous publications, answered inquiries, and gave instruction and demonstrations at numerous movable schools, farmers' institutes, and other meetings.

Extension work in Alaska, Hawaii, Porto Rico and Guam continued to be carried on through the Federal experiment stations. Settlers coming into the Tanana and Matanuska Valleys in Alaska have been aided in establishing their agricultural operations on the basis of the experience gained by the experiment stations. Distribution of suitable varieties of seeds to various parts of Alaska was also continued.

Extension agents, permanently located on the islands of Hawaii and Mani continued demonstration work with crops and fertilizers and began to organize boys' and girls' clubs and home demonstration work. In Porto Rico meetings of farmers were held throughout the island, information was disseminated through monthly circulars, demonstrations of dipping cattle to eradicate fever ticks were made, and coöperation of fruit growers was stimulated. In Guam 145 farmers conducted demonstrations with cowpeas, teachers throughout the island were aided in maintaining school gardens, 545 boys and girls were enrolled in clubs, conducted home projects with crops and animals, and made numerous exhibits at an agricultural fair.

Extension work was systematically conducted in Canada, France, Belgium, Spain, India, Burma, and Gold Coast Africa.

In England work was carried on through farmers' institutes, farm schools, local lectures and demonstrations conducted by a county agricultural staff or otherwise. Instruction in cheese-making was given at several hundred centres through courses for from two to four weeks. Over 700 women's institutes were held in England, Scotland, and Wales.

In Italy about 275 itinerant teachers gave instruction in agricultural subjects, including plant and animal production, silkworm and mulberry culture, cheese-making, plant diseases, use of tractors and other farm machinery. The funds for extension work were provided by the government, provinces, and local organizations.

Over 4500 Farmers' Institutes were held in 35 States by the colleges of agriculture, or State Departments of Agriculture, with an attendance of 1,268,000. Many similar meetings were held by the colleges as part of their agricultural extension work.

The general interests of the coöperative extension work throughout the United States continued to be promoted by two extension offices in the States Relations Service of the Department of Agriculture. The work in each State was administered by an Extension Director, with headquarters at the Agricultural College, who was a joint representative of the Department and the College. Under the Director were State Leaders of county agricultural agents, home demonstration agents and boys' and girls' club work.

For the fiscal year beginning July 1, 1920, the total fund available for extension work in the States was about \$16,836,000. Of this about \$1,025,000 was derived from direct appropriations to the States Relations Service, \$175,000 to other bureaus of the Department of Agriculture, \$3,580,000 from the Smith-Lever Act, and \$1,500,000 from the supplementary Federal fund, making the total Federal contribution \$6,280,000. This was met by approximately \$10,536,000 from sources within the States, including \$4,600,000 to offset the regular and supplementary Smith-Lever funds, \$3,727,000 from counties, and \$610,000 from farm bureaus and miscellaneous sources. About \$8,460,000 was used for the demonstrations and other activities of the county agricultural agents. Much of their work bore on problems of the farm home, but \$3,145,000 was allotted to distinctive work in home economics. About \$1,100,000 was used for work among boys and girls, about \$2,918,000 for the tasks of the specialists,

\$950,000 for administration, and \$245,000 for publications.

AGRICULTURAL LEGISLATION. The outstanding development of the year was the growing determination of farmers to play a more influential part in the framing of national policies. This attitude was intensified by the critical situation confronting agriculture as the result of the stupendous shrinkage in the value of farm products following the harvests of the year, and found expression in the formulation of definite legislative programmes by the American Farm Bureau Federation, the National Grange, and other farm organizations. While the year's record of completed legislation was not large, a much greater public realization of the needs of agriculture and its vital importance to the nation was strongly in evidence. The opening of the final session of Congress in December found unusual attention being given to agricultural matters, and several of them were well advanced toward passage by the end of the year.

One of these was a bill designed to assure producers of the right to bargain collectively without liability of prosecution under the various anti-trust laws. It authorized the formation and operation of coöperative agricultural associations, subject to regulation in case of undue price enhancement, attempted monopoly, or other unfair methods of competition. This bill was passed by the House of Representatives, May 31, 1920, and by the Senate December 15th, after amendments placing its administration under the Federal Trade Commission instead of the Secretary of Agriculture. This difference was being adjusted at the close of the year.

A joint resolution was passed December 20th, directing the immediate revival of the activities of the War Finance Corporation suspended in May. The President's veto of this measure was overridden by both the Senate and the House, with substantial majorities. This action was taken with the view of assisting in the financing of the exportation of agricultural and other products to foreign markets by providing special credit facilities. It was hoped that in this way European countries needing foodstuffs and cotton would be able to make purchases, thereby relieving American producers accordingly. An attempt to include in the act either directions or recommendations to the Federal Reserve Board to give greater attention to agricultural requirements in its operations was unsuccessful.

A provision in the annual appropriation act discussed elsewhere (see UNITED STATES DEPARTMENT OF AGRICULTURE) authorized the appointment of a joint congressional committee to investigate the feasibility of short-time rural credit legislation. Several amendments were also adopted to the Federal Farm Loan Act of 1916, operations under which, however, were largely suspended pending a decision by the United States Supreme Court as to its constitutionality.

A bill to create a Federal Live-Stock Commission for the regulation of the packing industry received extended consideration in the Senate, an agreement being reached to vote upon it Jan. 24, 1921. Plans submitted by the principal packing-house concerns themselves for a reorganization of the industry under their agreement of the previous year were rejected by the government. Legislation establishing central markets for perishable food products in all large cities and a Federal licensing system for dealers in such

foods was advocated by the Federal Trade Commission.

Numerous other measures were also receiving attention, including tariff legislation imposing high duties on imports of wheat, corn, rice, potatoes, peas, onions, beans, lemons, cattle and sheep, fresh mutton, wool, cotton, and other farm products instituted by the House, December 22; a bill passed by both Houses empowering the Reclamation Service to develop and sell farms for private owners at their expense; a bill to utilize the government air-nitrate plants for fertilizer manufacture, this being the unfinished business before the Senate at the end of the year; and several bills to prohibit speculation in farm products and to prevent the sale of fabrics containing shoddy as virgin wool. The influence of farm organizations was being vigorously exerted in support of most of these measures. Their opposition, however, was being generally manifested to several other propositions, including wholesale land reclamation projects, the imposition of either sales taxes or land taxes by the federal government, and the revival of "daylight saving."

The legislatures of only 11 States were in session in 1920. In Mississippi a commission was appointed to investigate the feasibility of reclaiming waste and cutover lands. New Jersey passed an act to encourage the formation of coöperative agricultural, dairy, and horticultural associations. Virginia revised its laws for the regulation of commission merchants, while in Connecticut a 1919 law requiring the bonding of milk dealers was held unconstitutional. Rhode Island provided for the voluntary licensing of persons making a business of spraying, pruning, and grafting trees.

New dog laws were adopted in Massachusetts and Virginia, looking toward the development of sheep raising. Kentucky prescribed lower interstate rates on agricultural lime, and Virginia revised its laws regulating the sale of that commodity. Kentucky also defined a legal farm fence, and standardized weights of farm products. Crop liens were further regulated in Virginia and billboards on public roads in Massachusetts.

Agricultural interests were more strongly represented than ever before in Canada, notably in Ontario where the so-called Farmers' Party assumed control of the government. A new feeding-stuffs law and a provision standardizing apple barrels and other fruit containers were the most important Dominion measures to be enacted.

In Europe, legislation naturally centred around reconstruction problems, notably as regards the rehabilitation of devastated areas, relations between landlords and tenants, farm labor, coöperation and credit, and the more adequate representation of agriculture in national affairs. Numerous laws designed to ameliorate the status of the actual tiller of the soil went into effect, ranging in scope from radical confiscations in Soviet Russia and various schemes for breaking up large estates in Germany, Poland, Roumania, and other central European countries, to the comparatively conservative Agricultural Bill under consideration in Great Britain. (See AGRICULTURE.)

The principle of compensation by the State to farmers and other private citizens for war losses was fully recognized in France and Belgium. A law enacted in the latter country late in 1919

allowed land owners either to undertake the work of reconstruction themselves, with eventual reimbursement, or to cede their land to the government for reclamation.

The British Seeds Act of 1920 prohibited the sale or sowing of any seeds containing above a prescribed percentage of weed seeds. This measure becomes effective Aug. 1, 1921.

AGRICULTURE. The year saw a considerable revival of agriculture in the European countries included in the war. Many of those countries were still dependent to a quite large extent on outside production. The difficulties of transportation and particularly the exchange situation, coupled with the inability of some of these countries to buy food, served to continue the food shortage. These same difficulties of exchange reacted unfavorably on the countries having an excess for export.

THE YEAR'S HARVEST IN THE UNITED STATES. The crop season in the United States presented an unusual number of obstacles, many of which were formidable. The spring was late, cold and wet, seriously delaying operations. In only four years of the past 37 was the progress of plowing up to May 1st so backward as in 1920. The labor shortage continued, the supply being approximately 37 per cent short, and wages rose to a point which was appalling to farmers. This with the continued high cost of fertilizers, machinery, and supplies, all of which had greatly increased since 1914, made the hazard unusually large. Altogether the American farmers were confronted in the spring of 1920 with the most difficult situation they had ever experienced. In spite of this, the largest harvest in the history of American agriculture was produced, with a single exception. The combined yields of the 10 principal crops was over 13 per cent above the average for the five years preceding the outbreak of the war. The corn (maize) crop of nearly 3,250,000,000 bushels was unprecedented, representing over four-fifths of the total world production. While the production of wheat, oats, barley, and buckwheat was slightly below the average, the rye crop was considerably larger than the five year average, the rice crop was one-fourth greater than the largest ever before harvested, and the grain sorghum crop was 18 per cent larger than that of the record year of 1919. The potato crop has only been exceeded once and then by a very narrow margin. The sweet potato crop was the largest ever produced and both the tobacco and sugar beet crops considerably exceeded any previous yield, the latter being one-third larger than the highest previous record. Cotton gave the largest crop since 1914, and fully 500,000 bales more than the five year average, while the tame hay crop had only been exceeded twice and the oat crop of more than 1,500,000,000 bushels only three times. Altogether the harvest was an unusual one and greatly exceeded expectations early in the season. (See specific crops.)

WORLD AGRICULTURE IN 1920. Indications pointed to a larger world crop of cereals than in 1919, amounting for the countries for which information was at hand to about 6 per cent for wheat, oats, corn, barley, and rye. In countries normally producing two-thirds of the world's wheat crop the apparent production in 1920 showed a gain of 2 per cent over 1919. While the wheat crop gained more than the population from 1919 to 1920, two prominent exporting countries, Canada and British India, were esti-

mated to have a combined 'crop of 193,000,000 bushels greater than in 1919. The countries normally producing about three-fifths of the world's crop of rice showed an extraordinary gain of 37 per cent over the crop of 1919. The United States, British India, and Egypt, which ordinarily produce about 80 to 85 per cent of the world's cotton had an estimated production 16 per cent larger than that of 1919.

It is interesting to note that in the United States the expansion of area devoted to crops under war conditions, estimated at a little over 10 per cent, was reduced in 1920. Following the armistice there was a reduction in crop acreage, which from 1919 to 1920 represented a decline of 5.4 per cent in the area occupied by 20 principal crops. Apparently the reduction was brought about by returning the land to pastures and discontinuing the use of low grade areas. The contraction in acreage was most extreme in the case of wheat and rye, the principal bread grains, the production of which was particularly stimulated during the war.

The returns for England and Wales show a falling off in area in cereals and an increase in that of clover, rotation grasses, and green crops. The acreage under wheat, 1,877,000, was 344,000 acres less than in 1919 and only 70,000 more than in 1914. There was an equal falling off in oats, but barley increased, the area being the largest since 1904. Potatoes occupied a largely increased area, the largest of record except 1918. Acreage in fallow was much above the pre-war average. A large reduction in the number of cattle and sheep was noted, but an increase in pigs.

In less than two years after the armistice the French people cleared and put under cultivation nearly 50 per cent of the land devastated in the war. Projectiles and the debris of battle were removed from 85 per cent of the farms. It is estimated that the 10 devastated Departments produced in 1920 enough cereals for their own need and possibly more.

Italy continued to fix the price for wheat, making a slight reduction in the basic price. Premiums were paid over and above this for grain produced in the southern provinces and also for wheat produced in excess of that raised in 1918. An increase in local production of bread stuffs at any cost was regarded as more advantageous than to continue importation on the former scale.

It is reported that Germany's importations of grain and feeding stuffs increased during the last generation, although highly improved methods kept her a prominent agrarian nation. Farming has been made more difficult of late by the agricultural labor problem involved with the low wages offered, the support by the Ministry of Agriculture of the idea of a farm laborers federation on the eight hour basis, and the cutting off of labor importation from Russia and Poland. Live stock numbers are short, farmers are said to be slow to accept the government food commission price for grain, large acreages devoted to crops and vineyards have been lost under the terms of the treaty, and there is a conflict of interest between city and rural populations.

PRICE DECLINE OF AGRICULTURAL PRODUCTS. After the farmers had met and solved the problems of production at unusual cost they were confronted at harvest time by a falling market, in midsummer when the farmers' period of out-

lay was nearly at an end and they were ready to dispose of their crops, a sharp decline occurred in the price of practically all farm products, covering nearly everything the farmers had to sell. It did not materially affect the articles they had to buy, for labor and materials used in harvesting were substantially as high as earlier in the season. As a result, a situation was brought about which aroused not only the serious concern but the indignation of farmers, and which it was feared might have serious consequences to agriculture and to the nation.

The effect was especially noticeable in the cereals and cotton. The worst slump in the history of grain prices took place. The drop in the price of wheat was especially sharp. From the high-record price of early summer wheat declined to nearly half, and corn likewise. This was paralyzing to farmers as it meant the selling of their wheat for less than the cost of growing. The average cost of producing the 1919 crop of wheat for the entire United States was estimated by the Department of Agriculture to be \$2.15 a bushel, and as it was not less for the crop of 1920, the average farmer stood to lose his labor and often more. It was charged in many quarters that the decline was due to manipulation, control, or other artificial causes, as well as to the importation of wheat from Canada, whose crop was 100,000,000 bushels larger than in 1919, and whose surplus was early put upon the market. This resulted in Canadian wheat underselling the United States crop from the time the movement started, and at the rate of exchange gave Canadian farmers a good price. Other factors were the world supply and demand for wheat, the partial recovery of European agriculture, and the lack of buying power and decreased consumption in European countries.

The complaint that speculators were responsible for the decline was borne out by the fact that practically all the selling in the future market represented short selling or liquidation of contracts bought from short sellers. The big corn crop and the consequent large fall in its price was another important factor affecting the price of wheat.

The extent of the change is indicated by the relative prices compared with 1919. In the spring and early summer they were from 21 to 24 per cent higher, considering all crops, than for the corresponding period in 1919, but on August 1st they were the same as a year previous, and on September 1st were 7 per cent lower than in 1919. This decline amounted to 14 per cent October 1st, and 28 per cent November 1st, so that on the latter date the prices of all crops were 33 per cent below those prevailing when the farmer planted and bore the cost of production. As a result the year's unusually heavy harvest was calculated as worth \$3,000,000,000 less than the smaller crop of 1919, and \$1,000,000,000 less than the still smaller crop of 1918. Live stock and its products also declined to such an extent as to cause serious losses to producers, the total value of animal products in 1920 being about \$200,000,000 less than in 1919.

The serious nature of the situation was recognized not only by the farmers but by public officials and the press. The condition was regarded as alarming and was commonly spoken of as a crisis. No other industry or business could suffer a similar experience without insolvency, and it was widely estimated that one-quarter of the

farmers of the country were facing bankruptcy unless there should be an early change in the price situation. Loans were being called, farmers and stockmen could not secure needed credit, and all other efforts at relief were unsuccessful. Attempts were made by farmers through their organizations to form combines to hold their products, especially wheat and cotton, and to pledge individual farmers to hold back the sale of their products, but these were not highly effective. Bankers were appealed to through their organizations, and the Secretary of Agriculture urged that they see to it that as far as possible the farmers were properly financed, not only to protect them from unwarranted losses but also to stabilize their business and insure adequate food production in future. A conference of the governors and governors-elect from more than half the States declared the situation to be grave and urged the federal government to create a finance corporation which through loans to foreign countries would stimulate the export of American food stuffs and other products. Proposals of farmers organizations that the war finance board be revived or money loaned to exporting corporations to finance exports met with disapproval from government officials. By the time Congress convened the demand for remedial action had taken quite definite form. Hearings were immediately begun and numerous bills and resolutions introduced. The Congress passed a resolution directing the revival of the war finance corporation to assist in financing the exportation of agricultural and other products for foreign markets. The Senate also considered an amendment to the Sherman Anti-trust Law giving farmers the right of collective bargaining.

An emergency tariff measure was passed in the House near the close of the year. This related wholly to agricultural products, including crops, wool, and live stock, and was proposed to run for 10 months. It fixed import duties which it was thought would serve as a considerable protection to American products.

Meanwhile certain other measures had crystallized into action. Among these was the formation of a \$100,000,000 export credit corporation, proposed at a conference of bankers, agricultural leaders, and manufacturers. This was known as the Foreign Trade Financing Corporation and was sponsored by more than 200 bankers. It was said to have a potential capacity of carrying \$1,000,000,000 worth of business. The Federal International Banking Company was organized in New Orleans with a subscribed capital of \$7,000,000, to assist Southern producers in marketing their surplus products by extending credit to countries desiring it for the purchase of such products. Using the 1920 situation as an illustration, the Federal Department of Agriculture urged the placing of American agriculture on a more satisfactory basis and the stabilizing of the business of farming, not in the interest of the farmer alone but of the nation as a whole. Means for carrying over the surplus from years of high production to periods of low production were suggested to that end, together with more attention to marketing and the development of the latent consumption demand in years of large supply. This would be helped by the establishment of a world market reporting service, which is now lacking.

STIMULATION OF AGRICULTURE IN ENGLAND. Great Britain has been making a pronounced

effort to retain some of the ground it gained during the war in the larger production of home-grown food and if possible to gain more in addition. The Royal Commission of Agriculture appointed in 1919 presented an interim report in which it recommended a continuance of the guaranty of minimum prices for wheat, barley, and oats grown in Great Britain, until Parliament otherwise decides, withdrawal from the arrangement being subject to not less than four years' notice. The proposed guaranties are to be calculated from year to year on the basis of the cost of producing in the preceding year.

The plans of the government for a fixed agricultural policy were embodied in the agricultural bill introduced in Parliament in the spring. These plans did not go as far as had been hoped by many friends of agriculture, and the bill met with considerable severe criticism, especially certain provisions for continued control over the cultivation of land. It is said, however, to be the most favorable measure to the industry ever introduced. The object is to give a greater sense of security to agriculture and to encourage greater enterprise in that direction. While providing for a reasonable profit through guaranteed prices it protects farmers against disastrous loss in engaging in a form of farming involving more risk than live-stock production and which with changing policy in the past has threatened ruin. The Corn Production Act of 1917 is made permanent except that guaranteed prices may be terminated on an order in council by a four years' notice. Control measures exercised through the county councils permit orders for a change in cultivation where not calculated to injure the persons interested, and landlords may be required to execute repairs necessary to secure proper cultivation. A second part of the bill relates to agricultural holdings and tenancy.

Since the armistice the agricultural executive committees have retained all the powers given under the Defense of the Realm regulations but cultivation orders have only been served in extreme cases and attention has been devoted mainly to leveling up and improving the general standard of farming. The county councils still held in their possession about 32,000 acres which they took over during the war, part of which was farmed by them direct and the rest by tenants.

Urging the importance to the country of increased food production, Premier Lloyd George gave an energetic denunciation of the "national weakness, folly, and scandal that £500,000,000 worth of food which could be produced here should be imported." Numerous articles were published by agricultural experts on the practicability of a larger measure of arable farming as compared with grass. Sir Daniel Hall declared that "over a much greater acreage than is now devoted to the crop (wheat) the British farmer is as well placed as any other to meet that need at a profit to himself." Sir Thomas Middleton, of the British Ministry of Agriculture, points out the great opportunity for expansion in wheat growing, stating that while wheat occupies only 4 per cent of the cultivated land of the United Kingdom, wheaten bread accounts for 16 per cent of the stock of home-grown food; hence the land in wheat produces about seven times as much food per acre as that in stock farming. He shows that as a result of the plow policy England and Wales in the last year of the

war, 1918, produced 52 per cent more wheat than in the 10 years preceding the war, 41 per cent more oats, 150 per cent more rye, and 57 per cent more potatoes. The net gain in 1918 represented 1,633,000 tons of human food, to bring which into the country would have required vessels having an aggregate capacity of 2,300,000 shipping tons of 40 cubic feet. To produce the amount of bread-stuffs required by the country and at the same time maintain the present production of milk, beef, and mutton, he estimates would call for 43,000,000 to 45,000,000 acres of arable land, whereas there are less than 47,000,000 acres of cultivated land available altogether. Hence he considers that such a scale of production is clearly impossible. The former director-general of food production in Great Britain also pleads for the more favorable use of land in producing human food and suitable encouragement and insurance on the part of the government.

In an interesting article on "Agriculture During Two Great Wars" (*Journal of the Ministry of Agriculture*, June, 1920), Lord Ernle, former president of the Board of Agriculture, contrasts the state of agriculture in Great Britain during the Napoleonic wars with that during the recent war. He estimates that between 1917 and 1919 the British farmer by his efforts at production saved the tax payers about £25,000,000.

Under an act of Parliament early in the year the British Board of Agriculture and Fisheries succeeded to the status of a first-class department known as the Ministry of Agriculture, with enlarged powers. The act of reorganization set up councils of agriculture for England and Wales and an agricultural advisory committee for both countries. It also established agricultural committees to take over the duties of the county councils pertaining to agricultural affairs. Lord Lee of Fareham became the new Minister of Agriculture and Fisheries. The name of the official organ of the Board of Agriculture was changed to *Journal of the Ministry of Agriculture*. The ministry appointed a woman advisor who will advise as to women to serve on the councils of agriculture, follow the work of the women's institutes, and in general watch over the interests of women in agriculture, which were greatly enlarged by the war.

According to the British Ministry of Agriculture, the total number of cattle per 100 acres in the United Kingdom is only 25 as against 40 in Belgium, 38 in Holland, and 32 in Denmark. There are but 9 dairy cows in the United Kingdom per 100 acres, compared with 20 in Holland and Belgium, 18 in Denmark, and 15 in Sweden; while the number of pigs is 8 in the United Kingdom against 30 in Belgium, 23 in Holland, 21 in Denmark, and 26 in Germany.

AGRICULTURAL CENSUS. Preliminary returns from the 14th census were issued during the year, giving data on the population and number of farms. These show that the trend of population from the country to the city has become greatly accentuated since 1910, and that for the first time in the country's history more than half the entire population is now living in urban territory, as defined by the census bureau; that is, of the 105,683,108 persons enumerated by the 14th census in continental United States, 54,816,209 or 51.9 per cent according to preliminary tabulation are living in incorporated places of 2500 inhabitants or more, and 50,866,899 or 48.1 per cent in

rural territory. Of the latter 9.3 per cent live in towns of less than 2500, and 38.8 per cent in what may be called the country districts; whereas in 1910 the figures were 8.8 per cent and 44.8 per cent respectively.

While the total increase in population since 1910 was 14.9 per cent, there was an increase in the portion living in urban territory equivalent to 28.6 per cent and in that living in rural territory of only 3.1 per cent; that is, the increase in population was over 12,000,000 in urban and only 1,500,000 in rural territory. Furthermore, the portion living in towns of less than 2500 shows an increase of 21.5 per cent, whereas that portion living in purely country districts shows an actual decrease of 250,000.

Statistics have been published by the Department of Agriculture to show that the population of the United States is increasing more rapidly than the food supply. Before the war the population was increasing at the rate of approximately 50 per cent every 20 years and wheat production was keeping up that rate of increase until after 1910, reaching its maximum in the five-year period 1910-14. In that period the United States was exporting only about 150,000,000 bushels of wheat and flour equivalent. With the exception of the year 1920, corn reached its maximum production more than 10 years ago and exports have fallen off to a fraction of what they formerly were. The United States is already importing more food than it is exporting, measured in money value, in the form largely of tea, coffee, tropical fruits, nuts, and sugar. From the statistics of production it has been estimated that at present rates the United States will cease to become a food exporting nation within from 15 to 25 years.

The Secretary of Agriculture makes these facts the text for a plea that everything possible be done to make farming profitable and country life more attractive, pointing out that the history of agriculture indicates that farming is in periodic danger of losing its grip on both capital and workmen and of allowing them to slip away into city industries. He points out that the real concern over the movement of rural population to urban centres is whether those who remain in agriculture are the strong, intelligent, well seasoned families which have characterized the agricultural population in the past. In order to assure this there can be no relaxation of the present movements for a better country life, economic, social, and educational.

The number of farms in the United States in 1920 according to preliminary official figures was 6,459,988, an increase of 98,496 over 1910. During the previous decade the increase was much greater, 624,130. The census definition of a farm is a tract of three acres or more used for agricultural purposes.

As a general rule the number of farms decreased in the older agricultural States and increased in the newer ones and in some special crop regions. The increase in most of the States is accounted for by the settling up of new territory, by homesteading former public lands, by developing cut-over lands, the division of large farms and plantations, etc. The general tendency toward larger units with the increased use of machinery and the decreasing supply of labor is explained as the reason for the decrease in the number of farms in a considerable number of the Central-Western States. This is not an indi-

cation of decline, as in all the States in which the number of farms has decreased agriculture has advanced.

LAND VALUES. The value of plow land has continued to increase steadily since 1916, the average per acre being 54 per cent higher in 1920 than in 1916. This increase was equivalent to 21 per cent in 1920 over 1919, which marked by far the greatest increase. There was a normal lag in the price of land in relation to crop prices.

Values in the South practically doubled in four years, and the formerly cheap lands in that section are overtaking the higher values of other States. The country-wide land boom reached its maximum in Iowa where considerable land was sold at \$400 an acre. The boom forced prices up to a level at which it was said to be impossible for any but the most exceptional farmers to make over 3 per cent on the capitalization. The increase in that State averaged \$63 from March, 1919, to March, 1920, or 32 per cent. The current high valuation is not justified by the earning power of the land, especially at normal prices for staple farm products. These inflated prices of farm lands are in part responsible for the distress which overtook farmers in the fall of 1920, especially where the land was heavily mortgaged.

INCREASE IN PRODUCTIVE POWER PER MAN. The extent to which the productive power of the farmer has increased, and the high point it has reached as a result of machinery and better farm practice, is shown by data presented by the Department of Agriculture. In the middle of the last century corn production averaged little more than 2 bushels per farmer's work day of 10 hours, when all the work was done by hand. The average rose to 14.5 bushels half a century later when the use of the gang plow, disk harrow, corn planter, self binder, and other machinery came into common use. The hand labor devoted to producing wheat in 1830 resulted in an average of hardly more than three bushels per work day of 10 hours. As a result of improved agricultural methods and machinery one day's labor now averages a production of 60 bushels, or 20 times as much. By using machinery and improvements, the farmer is able to produce 56 bushels of oats on an average by one day's labor of 10 hours, whereas in 1830 with hand labor, his average was 6 bushels, or only one-ninth as much. Similarly, in the case of potatoes the production has been trebled in the past half century, a farmer being able under modern conditions to produce an average of 57 bushels with one day's labor. The case is nearly the same with cotton, where hand labor is still largely employed. Eighty years ago the labor of a man for one day of 10 hours produced 45 pounds of cotton in the seed, whereas it now produces 127 pounds.

These data serve to indicate not only the increased efficiency of the farmer but the high degree which has been reached, greatly exceeding that of the farmer in any other country.

FARM TRACTORS AND TRUCKS. The development of tractor building for farming in the United States is illustrated by the fact that some 330 tractors have been placed on the market by over 200 manufacturers. A national tractor show was held in Kansas City early in 1920, at which 103 models were exhibited by 66 different makers. An outstanding feature was the increase in the number of all-purpose or small general utility tractors and motor cultivators, and

the arrival of the garden tractor. Prices ranged all the way from \$310 to \$5,750.

A journal entitled *Agrimotor* is being published in the interest of the industry. A three-bottom plow drawn by a suitable tractor enables one man to accomplish from 60 to 70 per cent more than a two-bottom plow drawn by six horses. Where the two-row corn cultivator is practicable this machine enables one man to cover nearly twice as much ground per day as with a one-row cultivator.

The growth of the motor truck in connection with farming has been rapid. A survey by the United States Department of Agriculture early in 1920 showed that at least 50,000 farmers in the United States own motor trucks which they use on their farms. The number of horses on farms has shown a decline as tractors, motor trucks, and automobiles have increased. The number of horses reached the maximum in 1913, and since then has been gradually declining. But even so, the Department of Agriculture estimated the total value of horses on farms Jan. 1, 1920, at \$1,993,000,000, or only slightly below that of the milch cows.

INTERNATIONAL INSTITUTE OF AGRICULTURE. The biennial assembly of the Institute was held at Rome in October. Interest centred largely on the prompt reporting of international statistics of crop production and prospects, but among certain of the European representatives much importance was attached to recording measures for the control of plant diseases and injurious insects.

The United States has been without a resident representative at the Institute for the past two years, since the death of Mr. David Lubin. The position is being filled at present by Dean Thomas F. Hunt of the University of California, who is on leave from that institution. The importance of a permanent representative is strongly urged by the American delegates to the assembly.

The Institute has voted to place in its building a tablet in memory of David Lubin, its originator and the American representative from the time of its organization.

MISCELLANEOUS. A department of agriculture and experiment station is being established in Liberia. The various technical and coöperative organizations concerned with agriculture in Denmark have recently organized a central agricultural council, known as the Landbrugsraadet, to promote their common interests. A Canadian Society of Technical Agriculturists has been formed in the interest of workers engaged in the agricultural profession in Canada, and plans to publish a scientific journal. The first meeting of the society was held in Ottawa in June.

Agricultural Engineering has begun publication as the monthly organ of the American Society of Agricultural Engineers. *Farm Engineering*, a quarterly, has also made its appearance.

The Journal of the Department of Agriculture is being issued as the official organ of the Department of Agriculture of the Union of South Africa, replacing a periodical suspended at the beginning of the war. An abstract journal for agriculture (*Zentralblatt für die Gesamte Landwirtschaft*) has begun publication in Germany. It is intended to review the literature in the whole field of agricultural science. *World Agriculture*, the official organ of the American Expeditionary Forces Farmers Club and the World

Agricultural Society, began publication during the year.

BOOKS. Among the books appearing during the year the following may be mentioned: *Agricultural Meteorology*, J. Warren Smith (New York, 1920); the first text-book exclusively devoted to this subject. *The Bases of Agricultural Practice and Economics in the United Provinces*, H. Martin Leake, Director of Agriculture (London, 1920); traces the history of agriculture, gives fundamental facts of agricultural practice and economics, lines along which development is likely, etc. *The Agriculture of Ohio*, issued by the Ohio Experiment Station as Bul. 327; a review of the history of Ohio agriculture from the earliest times with statistics of crop production and descriptions of the principal soil types of the State. *Hand Book of British Breeds of Live Stock* (issued by the Ministry of Agriculture and Fisheries, London, 1920); a revision of this publication descriptive of the principal characteristics of the British breeds of horses, cattle, sheep, and pigs, with brief history of their origin. *Cattle and the Future of Beef Production in England*, by K. J. J. MacKenzie (Cambridge, 1919). *Agricultural Economics*, by H. C. Taylor (New York, 1919); covers the economics of production and marketing and the problems of maintaining and improving the economic and social position of the farmer. *The Nation's Food*, by Raymond Pearl (Philadelphia, 1920); a statistical research relating to the food resources of the United States. *The World's Food Resources*, by J. Russell Smith (New York, 1919); a study of physical, geographic, and economic facts of the world's food supply, the possibility of increase, and adaptation of human consumption to new conditions of production and trade. *Agricultural Prices*, H. A. Wallace (Des Moines, Ia., 1920); a statistical study with discussion of the price registering system on the Chicago Board of Trade, the principles operative in determining prices, ratio of prices to production costs, etc. See also **HORTICULTURE, LIVE STOCK, DAIRYING**, and specific crops.

AGRICULTURE. INTERNATIONAL INSTITUTE OF. See **AGRICULTURE.**

AGRICULTURE, UNITED STATES DEPARTMENT OF. On February 2, 1920, Secretary David Franklin Houston was transferred to the Treasury Department by President Wilson and Edwin Thomas Meredith of Des Moines, Ia., editor and publisher of *Successful Farming*, was appointed Secretary of Agriculture. He gave special attention to explaining to the public, and particularly to business men and other city people, the organization and work of the Department of Agriculture and its relation to the general welfare. Dr. E. D. Ball, head of the Department of Zoölogy in the Iowa State College, was appointed Assistant Secretary of Agriculture, and W. B. Greeley succeeded Henry S. Graves as Chief of the Forest Service.

In his annual report for 1920, Secretary Meredith pointed out the difficulties under which the American farmers produced in 1920 the largest harvest in the history of our agriculture and their great disappointment because these products, obtained at abnormally high cost, would bring at current prices over \$3,000,000,000 less than the smaller crop of 1919. This condition impressed upon farmers the need of more attention to marketing and brought a demand on the Department for broader and more thorough information

PRODUCTION BY COUNTRIES IN 1919 AND 1920 OF WHEAT, RYE, OATS, BARLEY, AND MAIZE IN BUSHELS

on the economic problems of agriculture. To meet this situation so far as possible with its present resources, the Department was making a study of marketing conditions at home and abroad through its Bureau of Markets, in co-operation with the agricultural colleges and experiment stations and farmers' organizations. This included the accumulation of fundamental data regarding marketing processes and costs; the dissemination of accurate, disinterested market information; the elimination, wherever practicable, of waste and unnecessary marketing expenses; the development of standards for the grading of farm products and the standardization of containers; the promotion of efficiency in the storing, handling and shipping of farm products; and the regulation of marketing machinery in order to prevent any abuses or sharp practices. Farmers were also being aided in the organization and conduct of coöperative marketing. The consolidation of the Bureaus of Crop Estimates and Markets was recommended to prevent overlapping of work and to combine services in various lines. The enlargement of the crop and live-stock reporting service was strongly urged. The supervision of live-stock markets under the Food Control Act of Aug. 10, 1917, was continued by the Bureau of Markets but was greatly handicapped by lack of funds. The importance of the studies on the cost of production, farm organization, labor, finance, land-ownership, settlement and colonization, and the social problems of country life, was pointed out. "The present universal cry of 'Keep the boy on the farm' can and should be expanded into a great public sentiment for making country life more attractive in every way. Neither force nor exhortation will keep people in the rural districts if they are to be deprived of the benefits of modern social, educational, and other opportunities." Examples were given of the very important service the Department had rendered in controlling plant and animal diseases, insect pests and predatory animals and in helping to improve crop and live-stock production. In its work on the utilization of waste products the Bureau of Chemistry had discovered methods of utilizing corn-cobs so that they may be converted into a variety of highly useful articles.

Under the Federal Good Roads Act in the fiscal year 1920, 1670 projects submitted by the States, involving the improvement of 16,670 miles of roads and an allotment of \$109,830,366 of Federal funds, were approved and 1677 miles were entirely completed. Difficulties connected with transportation, lack of materials, labor, and contractors, and the disposal of road bonds had greatly interfered with road construction. To correlate more fully Federal and State highway agencies, the advisory board was enlarged to include all the officers and executive committee of the Association of State Highways officials. A more thorough classification of highways as a basis for a permanent policy of road development was under consideration. The Federal Road Act will expire June 30, 1921, unless Congress acts to continue it.

The need of a more comprehensive forest policy was urged, which should involve broader coöperation of Federal and State agencies, improved relations of national forests and national parks, utilization of grazing lands, and more comprehensive research on forestry problems.

Amendments were advocated to the Federal

acts relating to meat inspection, virus-serum-toxin, food and drugs, insecticides and fungicides, grain standards, food products inspection, warehouses, plant quarantine, interstate shipment of wild animals or birds, the administration of wild-life reservations. New legislation was recommended relating to commerce in seeds, feeds, fertilizers, naval stores, and marketing of live stock.

Great stress was laid on the necessity of legislation which would enable the department to strengthen its research and regulatory work by the payment of salaries which would attract and hold the most competent scientific and technical specialists and administrative officers. To better administer and coördinate the very large and varied work conducted by the Department through 15 bureaus and other offices, and to secure better relations with State work in similar lines, it was recommended that Congress authorize the appointment of directors of scientific work and of regulatory work as permanent officers under Civil Service regulations.

The regular appropriation for the Department for the year ending June 30, 1921, amounted to \$31,712,784, a decrease of \$2,187,427 as compared with those for 1920. Under permanent appropriation acts the Department controls the expenditure of additional amounts, including the road fund of \$100,000,000, the extension fund of \$3,580,000, and the meat inspection fund of \$3,000,000. The supplementary appropriation of \$1,000,000 to combat outbreaks of contagious and infectious diseases of animals was reduced to \$50,000, to which must be added an unexpended balance of \$500,000. Appropriations were reduced for the eradication of hog cholera, cattle tick and dourine, and for the study of animal diseases. For combating the European corn-borer \$400,000 was appropriated and for the eradication of the pink bollworm of cotton \$488,560. The appropriations for the Forest Service aggregated \$6,295,822, which were offset by \$4,385,414 of receipts from lumber sales and grazing leases in the National Forests in 1919.

The appropriation for the Bureau of Plant Industry was reduced from \$3,379,638 to \$3,004,394; Bureau of Markets from \$2,811,365 to \$2,538,700; and Bureau of Crop Estimates from \$371,102 to \$318,656.

Under the Bureau of Biological Survey provision was made for work relating to the improvement of the reindeer industry in Alaska (q.v.). To this Bureau was also transferred from the Department of Commerce the enforcement of laws for the protection of fur-bearing animals in Alaska.

In the Sundry Civil Appropriation Act \$725,000 was appropriated for the printing and binding of the Department of Agriculture.

AHEARN, JOHN F. Tammany politician, died in New York City, December 19. For some years past, he had been one of the leaders of Tammany Hall. He was born in New York City, April 18, 1853, and was a clerk in several business houses. Entering politics he was elected to the New York Assembly in 1882 and in 1889 he was elected to the Senate. He was subsequently appointed president of the Borough of Manhattan, where his administration caused serious complaints and finally definite charges were brought against him and laid before Governor Hughes. The latter after an investigation ordered his removal, Dec. 9, 1907. Then followed a contest

in the courts for two years. He succeeded in retaining his office until December, 1909, when he was compelled to obey the decision of Governor Hughes.

ALABAMA. POPULATION. According to the preliminary report of the census of 1920, there were 2,348,174 residents in the State, Jan. 1, 1920, as compared with 2,138,093 in 1910.

AGRICULTURE. According to the census of 1920, the number of farms was 256,023, a falling off of 2.6 per cent since 1910. The following table is compiled from the estimates of the United States Department of Agriculture, covering the years 1919 and 1920:

Crop	Year	Acreage	Prod., bbl.	Value
Corn	1920	4,277,000	67,149,000	\$65,806,000
	1919	4,334,000	62,843,000	99,920,000
Oats	1920	366,000	6,551,000	5,765,000
	1919	372,000	6,696,000	7,081,000
Wheat	1920	68,000	653,000	1,502,000
	1919	138,000	1,242,000	3,043,000
Tobacco	1920	2,500	*1,500,000	825,000
	1919	3,000	*1,890,000	567,000

TRANSPORTATION. At the close of the year 1920 the State had 4819 miles of main line and double track, and yard and siding track amounted to 1760 miles. There was no new construction of importance during the year.

FINANCE. According to the report of the State auditor for 1920, the financial situation was as follows: Total receipts, \$12,078,296; total expenditures, \$11,299,607; State balance, \$178,560; bonded debt, \$9,057,000.

LEGISLATION. An extraordinary midsummer session of the legislature was called by Gov. Thos. E. Kilby in 1920 to make suitable provision for the voting of the women of Alabama in accordance with the Federal woman suffrage amendment. The same conditions which previously applied to male voters were extended to include women and in addition the legislature submitted to the voters an amendment to the State constitution providing that in order to register or vote, the elector must be of good character and must understand the duties and responsibilities of citizenship under a republican form of government. This amendment was designed to prevent the voting of undesirable females of the negro race and the election on the amendment was called for Feb. 7, 1921.

A constitutional amendment was ratified in February of 1920, which authorized the State to issue \$25,000,000 bonds for the building of a State highway system. None of the bonds were marketed during 1920 as the amendment was attacked in the courts and financial conditions made them an undesirable investment as they

were limited to 5 per cent. At the midsummer session a constitutional amendment was also submitted allowing the sale of \$5,000,000 of the bonds at par and not more than 6 per cent interest. This amendment was also to be voted on Feb. 7, 1921.

POLITICAL CAMPAIGNS AND ELECTIONS. The year 1920 in Alabama was notable for one of the most remarkable political campaigns in the State's history. The Democratic primary was held May 11, to determine a successor to United States Senator Oscar W. Underwood. The candidates were: Senator Underwood, L. B. Musgrove of Jasper, and Judge S. D. Weakley. Out of 132,949 votes cast Senator Underwood's majority over his two opponents was only 882, while his plurality over Mr. Musgrove was only 10,659. In the same primary a State commissioner of conservation was nominated. Out of 112,257 votes cast the majority of John H. Wallace, Jr., the incumbent over A. L. Kimbrough was only 119.

The contest for senator was complicated by the fact that union labor took a more conspicuous political stand than in previous years in the State. However, a successor to the late United States Senator J. H. Bankhead was nominated in the same primary, Congressman J. Thomas Heflin being successful, in which contest the labor question was not a factor. The union fight upon Senator Underwood was based upon his championship of the Cummins railroad measure. His opponent, Mr. Musgrove, was national chairman of the campaign to ratify the Prohibition amendment to the Federal Constitution, so that this issue also figured prominently.

Democratic nomination is equivalent to election in Alabama so that the general election amounts to no more than ratification of what has been done in the primaries. The State election law has a unique provision whereby the candidate in the primary must receive a majority of all the votes cast. In order to avoid a second primary each voter also registers his second choice. In case a majority is not recorded for a candidate the two highest men add their first and second choice votes together, the one having the highest total of first and second choice votes being declared the nominee. The detailed results of the unusual primary of May 11, 1920, were as follows:

For United States Senator:		
	First choice	Second choice
L. B. Musgrove	56,257	5,172
Oscar W. Underwood	66,916	2,129
S. D. Weakley	9,776	21,199
For United States Senator, short term:		
	First choice	Second choice
J. Thomas Heflin	49,554	11,062
Emmet O'Neal	33,174	3,691
Ray Rushton	13,232	7,316
Frank S. White	34,854	12,699
Justice of the Supreme Court (two elected):		
Joel B. Brown		62,792
B. M. Miller		69,986
William H. Thomas		71,012

The results of the presidential election in November were as follows: Cox, Democrat, 163,254; Harding, Republican, 74,690; Debs, Socialist, 2369. The vote in 1916 had been: Wilson, Democrat, 99,546; Hughes, Republican, 28,662; Benson, Socialist, 1916.

The results of the senatorial election in November were as follows: Oscar W. Underwood, Democrat, 154,664; L. H. Reynolds, Republican, 77,337; Forsman, Socialist, 1984.

COAL STRIKE. The strike of the United Mine Workers of America in the Alabama coal fields was another important event of 1920. Sporadic strikes broke out in the State as early in the year as May. A general strike in the entire field, however, was called for September 5. It was claimed that more than 20,000 coal miners responded. The coal operators contended, however, that by November they had as many miners as ever and were mining a normal tonnage. The strike was attended by a great deal of violence particularly in Walker County. In that county Leon M. Adler, general manager of the Corona Coal Company, one of the largest producers in the district together with two deputy sheriffs were shot and killed while driving along the highway. This act culminated a long series of crimes and on September 17 Governor Kilby called out the entire National guard of the State for duty in the mineral district under the command of Brig.-Gen. R. E. Steiner. These troops were still on duty in the mine fields at the end of the year. Violence decreased immediately though on December 22 a guardsman killed a miner at Nauvoo in Walker County, who resisted arrest and the soldier, James Morris, of Company M, Tuscaloosa, was shortly afterward shot and killed by a miner named William Baird. Baird surrendered later claiming self defense, while the friends of the guardsman claimed he had been shot in the back. The incident caused very tense feeling to exist between the guardsmen and the striking miners.

OFFICERS. Governor, Thomas E. Kilby; Lieutenant-Governor, Nathan L. Miller; Secretary of State, W. P. Cobb; Treasurer, R. L. Bradley; Auditor, H. Fitzhugh Lee; Attorney-General J. Quincy Smith; Adjutant-General, Hartley A. Moon; Superintendent of Education, Spright Dowell.

ALABAMA, UNIVERSITY OF. A State institution for the higher learning, situated at University, Ala.; founded in 1831. In 1920, the enrollment of the summer school was 845 and the total enrollment in all departments was 2061. The total in the regular session was 1216 (eliminating duplications). The attendance was distributed as follows: College of Arts and Science, 720; School of Commerce and Business Administration, 71; College of Engineering, 210; School of Law, 135; School of Education, 129; School of Medicine, 51; and School of Pharmacy, 8. The university also provided for 30 students in the course for Vocational Rehabilitation. The endowment fund has been derived from royalties arising from leases of coal lands. In 1919-20, the income was placed at \$121,000, which, at the normal rate of increase, was expected to reach \$165,500 in 1922. The university library contained 50,000 volumes, but there were in addition a number of departmental and special libraries. President, George H. Demy, Ph.D., LL.D.

ALASKA. The Territory was recovering more slowly than any other part of the United States from the industrial disturbances and economic depression caused by the world war. Decreased population, reduced mineral production, inadequate transportation facilities and epidemics seriously affected development of resources and general prosperity. As material fac-

tors in territorial welfare should be noted the steady recuperation of the Pribilof seal herds, increased numbers and commercial utilization of reindeer, the larger use of forestal resources, the exploitation of gold lode mining, the development of coal fields, Federal action on leases, and the progress in the construction of the national railroad.

The divided and inefficient Federal control—due to the inattention of Congress and to bureaucratic methods of administration continued throughout the fiscal year. However the diminished population, reduced mineral output and impaired transportation gave rise to such complaints as resulted in a coöperative organization of the executive departments which promise material benefits in the near future. The personal visit of Secretary of Interior Payne to Southern Alaska led to prompt action to remedy as far as possible existing evils and to the adoption of such administrative methods as would best conserve the future of Alaska. Thorough reformation was possible only through Congressional legislation. Secretary Payne convened an inter-departmental board, with an Alaskan expert, A. H. Brookes, as chairman, on which were representatives of the Departments of Agriculture, Interior, Post Office, and of the Shipping Board. They were directed to investigate and report "As to what immediate steps can be taken to better conditions in Alaska, what industries can be developed, and resources exploited to give employment to a resident population which, in turn, will give a home market for Alaskan products."

After a study of all available data in their limited time, the Board in its report pointed out the restriction, through Federal laws, of oil and coal production for the past decade, the unavoidable depletion of fishery industries unless properly protected, the lack of a regular and prompt mail service, and the utterly inadequate means of transportation facilities, both on land and at sea. They reported that the past products of Alaska approximate \$1,000,000,000 in value, but that retrogression had set in, necessitating the adoption of a Federal policy to counteract it. The most important and urgent recommendations of the Board were as follows: (1) Coördination and consolidation of steamship service with resultant economies that would reduce passenger and freight rates; and improvement of the postal service; (2) the obtaining of Congressional authority for an Alaskan Development Board for Federal control of resources, and pending this the appointment of an inter-departmental Committee; (3) coördination of road construction, with the development of a comprehensive system of roads and trails; (4) investigation of the commercial feasibility of smelting copper ores within the Territory; (5) the immediate development of a pulp industry, and surveys of timber and water power contributory thereto.

As a result there was formed, by authority of the President, a permanent Inter-departmental Commission on Alaska, with the following functions: "To coördinate and bring together facts and suggestions touching matters affecting Alaska, and make recommendations for definite action . . . that duplication may be avoided and efficiency secured." The committee was composed of the Governor of Alaska, of representatives from the Departments of Agriculture, Commerce, Interior, Post Office, War, and of the Shipping Board and Power Commission.

POPULATION. By the census of Jan. 1, 1920, the population of Alaska was 54,899, of whom 29,210 were whites, and 25,788 natives, etc. They were distributed as follows, whites and natives respectively: Northwestern, 262 and 2884; Western, 563 and 6773; Southeastern, 12,257 and 5158; Upper Yukon, 5681 and 2667; Seward Peninsula, 1345 and 3922; scattered, 281 natives. Practically one-third of the population is in the Juneau-Sitka region. The recent decrease in the white population was primarily due to the unusually large number of men who volunteered for the world war, to the reduced mining operations, and to the high wages in the States. It is difficult to ascertain if the natives are generally decreasing more rapidly than is the fate of semi-civilized races in contact with those of higher civilization. The influenza epidemics of 1919 and 1920 caused nearly 1500 deaths—about 6 per cent of the natives. An epidemic of measles in about 1904 carried off fully as many more. Assuming the census of 1900 as being correct (that of 1910 has been questioned), when the natives were numbered 27,037, the diminution is proceeding very slowly.

LEGISLATION. Its sessions being biennial there was no meeting of the Territorial Legislature in 1920. Only a few Federal legislative acts were specially applicable to Alaska. By the Act of May 31, 1920, jurisdiction over land fur-bearing animals was transferred from the Department of Commerce to the Department of Agriculture. Congress also authorized action for the improving and safeguarding of the reindeer industry through joint coöperation of the Bureaus of Biological Survey and of Education. The general leasing laws enacted by Congress will greatly hasten the development of the coal, oil, and forestal resources.

COMMERCE. The annual decrease in the value of shipments into and from Alaska continues. The aggregates for recent fiscal years were: 1918, \$131,010,368; 1919, \$116,945,475; 1920, \$109,325,445. The inward shipments were: 1918, \$44,280,075; 1919, \$35,554,034; 1920, \$33,998,462. Of the inward shipments during the year it is to be noted that in general they increased, except for a falling off of iron and steel, which were largely employed for railroad construction and cannery purposes. The decrease of \$80,000 in coal followed local development of mines. The outward shipments were: 1918, \$86,730,293; 1919, \$81,730,293; 1920, \$75,326,983. Large decreases occurred to the extent of \$431,674 in gold and silver; of \$667,128 in copper, although the quantity was increased; and of \$8,305,796 in fish. Encouraging increases were sealskins, \$461,000, and other furs \$421,651. It should be recalled that wide fluctuations in prices during recent years deprive these comparisons of their usual import.

AGRICULTURE. As an established business farming is steadily improving in importance, but its markets are limited and local. The most prosperous and extended operations are in the Tanana Valley, near Fairbanks. In that region there were 102 homesteads, cultivated by 230 persons. In 1919 the crops were 60 tons of wheat, 40 of oats, 10 of barley, 500 of hay, 325 tons of potatoes, and 60 of other vegetables. The average wheat yield was 19.6 bushels per acre. Coöperative buying of equipment and supplies is under organization. The Matanuska region also raised enough vegetables for local

consumption. Stock raising is an incipient industry, needing Federal aid for its economical development. See AGRICULTURAL EXTENSION WORK.

FISHERIES. Fishing industries reached their maximum output, both in quantity and in value, in 1918. The annual catch in late years was: 1918, \$59,154,859; 1919, \$50,282,067; and (estimated) 1920, \$43,897,447. In 1919 persons employed 28,534, decrease 2679; capital \$84,181,560, increase of \$430,771. The decrease in salmon is shown later. The laws for protecting the fisheries are highly unsatisfactory, and unless remedied the fisheries will fall off as did the seals under neglect. With regard to the fishing industries, the Advisory Committee reported that it was the most important business of the Territory from the standpoints of product and of men employed. It added: "The Alaska salmon catch has probably reached its maximum, and any effort to a more intensive development will lead to rapid depletion. Proper safeguards can make the salmon fishery yield a large and continuous return. Without drastic protection the halibut fisheries will soon be depleted, as many banks are without the three-league limit."

SALMON, ETC. The salmon continues as the most valuable product of Alaska, its annual values being in late years more than double all the minerals produced in the Territory. While cured, fresh, and dried salmon amount in value to several millions of dollars yearly, the canned fish cover 95 per cent of the catch. The number of cases—48 1-pound cans to the case—in 1917 was 5,946,986, and in the maximum year, 1918, 6,605,535, valued at \$51,041,949. The pack of 1919 was 4,583,688 cases, \$43,265,349. The year 1920 also shows a falling off, being estimated at 4,225,000 cases.

The decrease in the salmon industry naturally caused great anxiety, and Dr. Hugh Smith, Chief of the Bureau of Fisheries, strenuously labored to remedy the situation, which could only be done under Congressional legislation. Departmental restrictions have in a measure preserved the more important spawning grounds, but commercial exploitation tends to over-fishing, endangering food resources of the natives and impairing the material future prosperity of the nation. Violations of the fishing laws and regulations were of frequent occurrence, and the systematic stealing of salmon from traps prevailed during the past two years. The halibut fisheries of 1919 produced 14,278,791 pounds, valued at \$1,150,605. About 6,000,000 pounds were delivered at Canadian ports, not included in the above. The catch of 1920 approximated 16,000,000 pounds. Herring now meets with competition from European countries, and in 1920 fell off to about 12,000,000 pounds. The cod catch for 1920 amounted to about 7,000,000 pounds, the product decreasing owing to Japanese competition.

REINDEER. The introduction of reindeer into Alaska has proved to be the greatest of benefits conferred by the government on the natives. The original importation of 1280 animals had increased in 1920 to about 275,000 deer. Approximately 100,000 had been killed for food or skins, leaving about 175,000 animals. While the deer were scattered along the coasts of Bering Sea and of the Arctic Ocean, the larger number were on Seward Peninsula. They were owned as follows: Natives, 69 per cent; Lapps and

whites, 22; missions, 5; and United States, 3 per cent. The reindeer industry has gradually transformed the Eskimo from a hunting to a pastoral people. Sense of property, pride of possession and desire for improvement in deer training have been the outcome. Disease and deterioration have threatened the future of the herds. However, a recent appropriation by Congress enabled the Bureau of Biological Survey and of Education to investigate and adopt such means as would best conserve the interests of the Eskimo owners. Prompt action was taken in this matter by Dr. Nelson, Chief, United States Biological Survey, who established at Unalakleet, Norton Sound, an experimental station for the treatment of the subjects of disease and breeding of reindeer, with an experienced pathologist and veterinarian as a working force. The exploitation of the reindeer for outside use had commenced with the herds owned by whites. Every steamer from Nome was loaded to the capacity of its cold-storage plant for transportation of meat to the States. Unfortunately the capacity was limited,—carrying only 99,000 pounds in 1918, and 37,000 pounds in 1919.

FUR SEALS. The seal herds of the Pribilof Islands increase steadily though slowly. The enormous damage wrought to these rookeries by pelagic hunting,—stopped by international convention between Great Britain, Japan, and the United States,—cannot be repaired within a generation. The average catch for six years, 1884–89 inclusive, exceeded 130,000 skins annually. The average number taken in the three years 1918–20 was less than 30,000. The census of late years gives the following numbers: 1918, 496,432; 1919, 524,235; 1920, 548,473. The distribution in age and sex for 1920 was. Cows, 167,527; pups, 167,527; bulls, 5227; yearling males, 51,074; yearling females, 51,081; 2-year males, 36,790; 2-year females, 37,158; males three years and over, 32,067. The only decrease of the year was in males over six years old, from 18,610 to 8075. These figures exclude seal killed for food by the natives, and those killed for their skins. The number of seals taken: 1918, 34,890; 1919, 25,381, and in 1920, 25,978. There were sold at auction in 1919 19,157 dressed, dyed and machined skins for \$1,501,603. The net proceeds turned into the Treasury in 1920 was \$1,457,791, beside which the sum of \$271,894 was set aside as due Great Britain and Japan under the fur-seal convention.

MINOR FUR-BEARING ANIMALS. By Act of Congress, May 31, 1920, jurisdiction was given to the Department of Commerce over seal and walrus, while the Department of Agriculture has charge of the land animals, except the fox herds of the Pribilof Islands. The land catch fell off, but as the prices of pelts were higher, the values were \$1,379,348 against \$1,305,021 in 1919. The fox pelts from the Pribilofs for the years 1918–19, numbered 667 blue, average value \$195.90, and 30 white, value \$55.33. The furs of land animals, including the foxes of the Pribilof Islands (667 blue, average value \$195.90; 30 white, \$55.33), in 1919 aggregated in value \$1,512,282. The economic importance of the land fur-bearing animals is not generally realized. In 1919, however, the value of these pelts exceeded by \$1382 the amount received for the fur seal. More than half the value of land pelts was derived from foxes, \$831,369. Although the average value of the blue fox is greatest, \$195.31, yet revenue

from this species was exceeded by both the white and red foxes, as also by the mink and muskrat. In order named the most productive species are: Red foxes, \$270,305; mink, \$252,360; muskrat, \$215,939; white foxes, \$212,110; blue foxes, \$203,854. It is worthy of note that the catch of foxes on the Pribilof Islands,—901 blue and 37 white in 1920,—is the largest number within 25 years. The conservation of these animals is closely supervised by the Federal officials. The Secretary of Commerce ordered close seasons as follows: Beaver until November 15, 1923; marten, November 15, 1925. The Territory is divided into three districts, and specific dates fixed for the open seasons in each, when fur-bearing animals can be killed. In general this season extends from December to March.

NATIVES. The decimation of the natives continued, the decrease being from 32,996 in 1880 to 25,508 in 1920. In 1918, 850 natives died of influenza, introduced along the lines of commercial exploitation. In the recurring epidemic of 1919 there were 45 deaths at Unalakleet and 440 in the Bristol Bay region. In some villages every adult is said to have perished. There were left 250 orphans who were distributed as far as possible among adjacent Eskimo families, the rest being assembled in two orphanages established for the purpose at Kanakanak and Tyonek. Through the Alaskan Bureau of Education the condition of the natives steadily has improved. There was better sanitation, prosperity in coöperative settlements, increase in school gardens, and better industrial training. Improved conditions were notable in the self-governing colonies on government reservations. The native town of Hyaburg is a modern community, with cannery, saw and other mills, dock, and an electric light system. Its coöperative trading company had June, 1920, assets exceeding \$60,000, and its original shares of \$10 had netted in nine years \$244.28. Noorvik, in the Kotzebue Sound region, near the Arctic Circle, with other modern plants has the electric light system.

Governor Riggs in reporting progress in education mentioned the condition of the natives (Kliinkits) of southeastern Alaska, as numbering among them clergymen, teachers, merchants, and navigators: They own homes, vessels, etc., and some are wealthy. The canneries in 1919–20 employed 3875 natives during the active season. The Pribilof natives steadily improve in mental and material ways under the supervision of the United States Bureau of Fisheries. Federal coöperation now enables the natives at remote points to dispose of their furs and make purchases through the officials of the Bureau of Education at Seattle.

The colony of Metlakatla, on Annette Island, renewed its prosperity under Federal supervision. The leasing of rights of fishing, canning, lumbering, etc., netted in 1918 \$70,253. The commercial company of the natives more than quadrupled its number of shareholders and its capital in three years' trading.

SCHOOL SERVICE—TERRITORIAL AND FEDERAL. Under Territorial management there were maintained 68 schools for the whites and those of mixed blood, at an expense of about \$96 per pupil, of whom about 3500 were enrolled. For full or half-blooded natives the expense was \$68,000, which it was thought the United States should meet. The separate schools for natives are conducted by the Alaskan Division, U. S.

Bureau Education. Under Superintendent Lopp the allied services of medical relief, education, and reindeer raising were administered. In 1920 the entire force consisted of 6 superintendents, 133 teachers, 9 physicians, and 13 nurses. There were schools in 67 native villages, where they were the centres of all activities,—civic, industrial and social. They are invaluable factors in the development of the children into a generation of educated, industrious and self-supporting adults who will largely contribute to the general welfare.

NATIVE MEDICAL SERVICE. The medical relief appropriation of \$80,000 was spent in maintaining hospitals at Juneau, Kanakanak, Akiak, Nulato, and Kotzebue. In each village the teacher has a standard equipment for ordinary ailments and minor injuries.

ALASKAN MINERAL PRODUCTION. The output from the mines of Alaska, which in 1920 aggregated about \$460,240,000, reached its annual maximum in 1918, after which year it seriously diminished. Two prominent factors caused this decline, the high operating costs brought about by the world war, and the great fall in the price of copper. Subsidiary to these were the scarcity of labor, and the gradual change in gold mining from the exploitation of placers to the development of lodes. The total mineral outputs in recent years were: 1916, the maximum year, \$48,632,212; 1917, \$40,700,205; 1918, \$28,253,961; 1919, \$19,820,913; and 1920 (estimated), \$22,070,000. The increase in 1920 was due entirely to a larger output of copper, amounting to \$3,600,000. The output of gold, temporarily displaced by copper, resumed in 1919 its supremacy as the most valuable of Alaskan minerals, but is again surpassed by copper. The amount and richness of copper deposits ensure speedy increase in the product whenever the price of copper advances, or a feasible plan of smelting ores locally is devised. Placer outputs will probably be increased in the near future by improved methods of exploiting large bodies of auriferous gravels of low gold content. Lode gold-mining offered prospects of an extended output as soon as conditions of transportation improved and labor costs were reduced. Coal, oil and petroleum conditions were more favorable under recent leasing laws. However, no marked improvement in the mining industry could be expected until transportation facilities were much better,—on land by railroad and roads, at sea by reorganized shipping arrangements. In round numbers the values of 1920 showed the following changes from 1919: Increases, copper, \$3,600,000; silver, \$195,000; platinum, \$6000; lead, \$69,000; coal, \$36,000; petroleum, etc., \$5000. Decreases were: Gold, \$1,426,000 and tin, \$53,000. The most encouraging feature of 1920 was the development of a large auriferous lode in the Nixon Fork (Kuskokwim) district, giving promise of value.

GOLD AND SILVER. The products of the most precious metals, gold and silver, from 1880 to 1920 inclusive were approximately as follows: Gold, \$320,000,000; silver, \$7,250,000. The maximum output of gold was \$29,411,716 in 1909, and in late years, \$9,480,942 in 1918; \$9,426,032 in 1919; and (estimated) \$8,000,000 in 1920. In recent years there have been great changes in the methods of production. The gold output of siliceous (auriferous lodes) ores from 1880 to date was 29.5 per cent of all, but there was a notable increase from 31 per cent in 1917 to

46.6 in 1919. Twenty-three lode gold mines produced in 1919 values of \$4,392,237, as against values of \$3,473,317 in 1918. This increase came from four large mines in the Juneau and Sitka districts. The average gold and silver content per ton of ore was \$1.38 in 1919, and \$1.70 in 1918. The lode mines and outposts were in 1919: Southeast Alaska, seven, \$4,174,407; Willow Creek, five, \$162,594; Fairbanks, six, \$41,893; Kenai Peninsula, three, \$8987; and two others \$4006. In 1920 the estimated output of 15 lode mines was \$4,360,000.

The placer mines in 39 years yielded gold to the value of \$218,000,000. This industry, seriously affected by economic conditions, is in its decadence. While the main cause of decrease was the depletion of bonanza placers, it was hastened by shortage of labor and increased costs of working. In 1918 the 574 working placers produced gold to the value of \$5,900,000. The output of \$4,970,000 in 1919 was curtailed by the reduction of 108 summer placers, with 823 miners, and 65 winter placers with 295 miners. No important placers were discovered during 1920. The more important outputs in gold and silver of placers in various districts were respectively as follows: Hot Springs, \$100,000 and \$915; Marshall, \$100,000, \$699; Koyukuk, \$1,100,000, \$851; Circle, \$135,000, \$1411; Innoko and Tolstoi, \$140,000 \$8415; Bonnifield, \$254,000, \$84; Ruby, \$165,000, \$1406; Kuskokwim, \$350,000, \$7; Tolovana, \$525,000, \$2454; Iditarod, \$725,000, \$5937; Fairbanks, \$730,000, \$5708; Seward Peninsula, \$1,360,000, \$7. It is to be noted that the output of placers on Seward Peninsula (Nome) in 1919 increased \$252,000. This in face of the yield of gold per cubic yard of gravel decreased almost uninterruptedly from \$3.74 in 1908 to \$1.10 in 1919. As Mr. Brookes pointed out, the fact that placer mining has survived is due to improved methods,—use of dredges, etc. The placer productions fell off from 1919 to 1920 about 37 per cent. The estimated decreases were: Southeastern Alaska, \$420,000; Copper River, \$10,000; Cook Inlet and Susitna, \$35,000; Yukon, \$1,185,000; Seward Peninsula, \$120,000; Kobuk, \$10,000. The only district showing an increase is Kuskokwim basin, \$50,000. Dredging declined less than other forms of placer mining.

Silver is most largely derived from the copper ores. The production in ounces and values were: 1919, 488,034, \$705,273; 1920, 887,000, \$900,000.

LEAD. The total output to include 1919 was 4184 tons, valued at \$522,318. It is derived almost entirely from the concentrates of the Juneau gold mines. The product of 1920, about 880 tons, value \$14,000, is the largest ever mined in one year. The largest amount came from the Kantishna district.

TIN. The total production to 1919 is 972 tons, valued at \$918,152. Recently there has been a decrease from 139 tons in 1916 to 86 tons and \$73,400 in 1919. York district, Seward Peninsula, is the main source of this metal. The output for 1920 fell to about 31 tons, value \$20,000.

PETROLEUM. Although there are extended promising fields of petroleum in Alaska, yet there were shipped into the Territory in 1919, 24,284,535 gallons of various kinds of oil. The withdrawal of such lands from public entry in 1910 has restricted local production of oil to a small patented area in the Katalla region. The leasing law of February, 1920, promises to afford

relief in the development of petroleum resources. The petroleum, marble, gypsum, etc., increased in value from \$143,113 in 1918 to about \$148,000 in 1920.

PLATINUM. Platinum, palladium and other metals of this group are largely derived from the copper palladium ore of Salt Chuck mine, Ketchikan. The output of 284 fine ounces, \$36,600, in 1918 increased to 570 ounces, \$73,663, in 1919. The value of the 1920 production was \$80,000.

COAL. Although coal fields exist in many parts of Alaska, the fuel condition thereof is indicated by the shipment into the Territory of 31,291 tons of coal for the nine months ending September, 1920. Withdrawals and Federal restriction during the past eight years have prevented commercial development except one patented section in the Bering River region. Under the recent leasing law there have been two grants in the Matanuska bituminous field, and two in the Nenana lignite fields. The Matanuska field has been developed by the United States under the Alaskan Engineering Commission, in connection with the construction and operation of the United States Railroad. In the Nenana field, lignite veins have been opened and several thousand tons of coal been obtained. In the more important Matanuska field the commission blocked out about 100,000 tons of high-grade bituminous coal at the Chickaloon mine. This mine was transferred to the United States navy on July 1, 1920, which is operating the mine for naval uses. The commission yet carries on operations at the Eska mine, where it has mined about 150,000 tons of bituminous coal, which supplies the needs of the railroad and other plants connected therewith. The coal mined in 1920 had a value of about \$380,000 as against \$343,347 in 1919.

COPPER. From 1908 to 1919 there was mined 616 million pounds of copper, valued at \$127,000,000. The maximum output was in 1916, 119,854,838 pounds, \$29,284,291. In 1919 six mines closed down, and the amount mined fell to 47,220,771 pounds, \$8,793,063. The values of the copper at various mines were: Ketchikan, three mines, \$117,013; Prince William Sound, five mines, \$1,915,852; Chitina, three mines, \$6,750,196. In 1920, eight mines produced 71,000,000 pounds of copper, \$12,400,000; gold, \$12,000; silver, 710,000 ounces, about \$720,000. Promising copper deposits have been discovered in the Susitna district, which await better economic conditions for their exploitation.

RAILROADS. The situation as regards commercial railroads remains unchanged, except for the construction of a railway for transportation of coal from the Bering mines to the sea at Cordova. The most important enterprise in Alaska is the construction of the United States Railroad. When completed this will include a standard-gauge line of 412 miles from Seward to Nenana, on the south bank of the Tanana River, with branches of 38 miles from Matanuska Junction to the Chickaloon coal mines, and of three miles on this branch to the Eska coal mines. In addition there is on the north bank of the Tanana a narrow-gauge road of 54 miles from North Nenana to Fairbanks, with a narrow-gauge branch of 32 miles from Happy to Chatinika. The north and south sections will be connected by a 3000-foot bridge across the Tanana. Progress on this most important project materially

slackened in 1920, due to lack of appropriations, short supply of labor, and a serious epidemic. The limit of the cost of the system was originally fixed at \$35,000,000, but the enhanced cost of material and rising wages exhausted the original funds, so that Congress in October, 1919, increased the limit to \$52,000,000 and appropriated \$6,000,000 for continuing the work. Emigration for war service reduced the local labor to such an extent that the Engineering Commission,—under whom the road is constructed,—was not only obliged to largely increase wages but had to charter a steamer to transport to and fro its workmen hired in Seattle. An epidemic of influenza incapacitated 90 per cent of the men on the northern division, and caused a number of deaths. At the end of the working field season of 1920 there remained to be completed the following: construction from mile 262 to mile 358, and the erection of bridges over the Susitna, mile 264; at Hurricane Gulch, mile 284; at mile 373, and across the Tanana River at Nenana. It is planned to have the road entirely completed and in full operation by the summer of 1922.

AIDS TO NAVIGATION. The efficiency of sea-transportation has been frequently impaired by insufficient safeguards along the precipitous and rocky shores. Frequent recommendations to increase the means of the Lighthouse Board have been unavailing to a great extent. There were, however, added in the last year 20 new lights, 17 buoys, and 11 beacons. The danger points of Cape Spencer, Cape Hinchinbrook and Point Retreat remain inadequately lighted.

FORESTS. The two great national forests,—Chugach, 5,130,201 acres, and Tongass, 15,449,539 acres,—have been administered for 1919-20 at an expense of \$56,394, with receipts of \$106,921. Active steps are in progress for the development of the forests by a system of roads and through leases. A pulp factory is under construction at Port Snettisham, to which 100,000,000 feet of timber has been sold. Other leases for pulp manufacture, for a term of 30 years, are under consideration, so that the utilization of the forestal wealth of southeastern Alaska may be considered as in progress, especially in sections adjacent to water power. In 1920 ten applications were made to the Federal Power Commission for water rights in Alaska.

MAILS. Of this service the Advisory Committee says: "The Post Office Department is not functioning and cannot meet the needs of Alaska under existing organization of transportation facilities." To the great detriment of the inhabitants the Post Office Department and steamship companies are at odds about contracts. Letter mail is slow and uncertain, being shipped by express. Other classes of mail are shipped as freight and suffer much from neglect and by losses.

MILITARY TELEGRAPH SYSTEM. The delay and uncertainty of the mails has made the telegraph service unusually beneficial during 1920. It comprises 56 offices, with a force of 255 army and 48 civilians. In 1919-20 its paid business amounted to \$236,509 tariffs, while the tariffs of the governmental business aggregated \$235,517. The submarine cable from Seattle to Sitka, laid many years since, has been damaged in parts, and is to be repaired by 100 miles of new cable, authorized by congressional appropriation. The service of this system is now sup-

plemented by nine radio stations of the navy, which bring the Pribilof and adjacent islands into regular communication with southeastern Alaska.

TRANSPORTATION. Not only all future development, but also the maintenance of existing industries depend very largely on cheaper transportation by sea and on land. Sea transportation is inadequate and expensive, and in southeastern Alaska Canadian competition is a serious factor. The freight and passenger traffic has an inward overcrowded steamer peak in spring, and an outward peak in autumn. The remainder of the year steamers are only half loaded.

WAGON ROADS AND TRAILS. The important problems of road construction remain divided between three agencies,—Alaska (War) Road Commission, Forestry Roads, and Territorial Commission. Four Federal bureaus have funds for the construction of roads. The Advisory Committee set forth that the exploitation of extensive unworked mineral deposits is absolutely dependent on wagon roads and trails. Recommending cooperation of the three agencies in devising a system of roads, the committee urged specifically the early construction of 16 roads, of which five, tributary to the railroad, should reach the mining districts of Kantishna, Nizina, Talkeetna, Valdez, and Yentna.

PUBLIC LANDS. Years of neglect in this service have been followed by slow progress in surveys. Efforts to consolidate the different branches of the land office have failed. In 1919-20 there were 18 townships, whole and fractional, surveyed, making a total of 152 townships—68 on the Seward meridian, 46 on the Fairbanks, and 16 on the Copper River.

ALBANIA. A geographical region formerly made up of the Turkish provinces of Scutari and Janina and parts of the vilayets of Monastir, and Kossovo, which for several years before the war had an indeterminate status and which presented one of the Balkan problems at the Peace Conference and afterwards. The estimated area has been given as between 10,500 and 11,500 square miles and the estimated population between 800,000 and 850,000, of whom about two-thirds are Moslems, the remaining one-third Christians, being divided into Roman Catholics in the north and Orthodox Greeks in the south. After 1914, the provincial capital was Durazzo with a population of 5000. Other important towns with their estimated populations are Scutari (32,000); Elbasan (13,000); Tirania (12,000); Berat (8500); Korytza (8000); and Valona (6500).

The independence of Albania was declared at Valona, November 28, 1912, and accepted in principle by the London conference of ambassadors, December 20, 1912. Afterwards the governments of the Powers decided approximately the frontiers and agreed that it be governed by a European prince. The crown was conferred upon Prince William of Weid, Feb. 21, 1914, who was to rule under the advice of an international commission of control. The country fell into anarchy after the beginning of the war, when the members of this commission departed and Essad Pasha, who had been driven out in May, returned September, 1914, and tried to set up a military government, but failed (Oct. 5, 1914). During the war the Austrians overran the country and captured Durazzo, Feb. 28, 1916. Mean-

while the Italians had also penetrated Albania and Jan. 3, 1917, the Italian general declared the country independent, and a provincial government was set up at Durazzo.

HISTORY. In 1920 the charges of Serbian atrocities continued and a commissioner of Albania at Washington repeated them in detail. They were denied by the minister of Jugo-Slavia at Washington. It was reported on June 6th, that the Albanians had begun a formidable revolutionary movement against the Italians for the purpose of driving out their troops. Down to that time it had been generally supposed that the people were favorable to Italian rule, either in the form of a protectorate or under a mandate. According to the organs of the revolutionary element, Italy was not justified in her claims. The following summary presents the Albanian contentions:

The views commonly entertained on the subject were said to be the result of Italian propaganda which had spread the report that the Albanians were so well satisfied with Italian rule that they had no desire for national independence. Italian propagandists had dwelt on the gratitude of the Albanians for Italy's deliverance of the southern Albanians from the Greeks; also on the weakness of Albania and her consequent need of a protecting friend. Finally reports were circulated that the Albanians were unable to govern themselves and required therefore the direction of Italy. Then came the Italian claim to Valona, Albania's chief seaport, on the ground that its possession would place Italy in a position of security for the exercise of her authority. The recent events which had led to the present situation were thus summarized: By the secret treaty of London, April, 1915, Albania was partitioned among Italy, Greece, and Serbia. On June 3, 1917, the commander of the Italian expedition in Albania, General Ferrero, officially declared in the name of the King of Italy that the Albanians should have a government of their own under the protection of the crown of Italy. After President Wilson visited Rome in December, 1918, and in his speeches declared that the Balkan states should be left free and undisturbed by foreign interference, the national Albanian assembly at Durazzo, December 25, 1918, elected its first governor of the reestablished Albanian state in the face of the opposition of the Italian authorities. Italy interfered by controlling the cables, telegraphs, etc., and suppressing the news about the new Albanian government and by refusing to issue passports to Albanian delegates to the Peace Conference that were not acceptable to her. The Albanian delegates through Italy's influence had been only twice admitted to the Conference, and Baron Sonnino of the Italian delegation had said there was no need of a separate Albanian mission because the Italian delegates would speak on behalf of Albania. Having lost faith in the Italian government, the Albanian delegates on April 4, 1919, adopted an independent policy and sent a protest to the Conference to the effect that Italy aimed at subjugating Albania or dismembering her under the terms of the treaty of London. Things were worse under the presidency of Signor Nitti. In September, 1919, it was learned that Italy had made a separate agreement with Greece for the building of a railway through southern Albania without consulting either the Albanian

government or the Albanian people; thus Italy was treating Albania as an Italian province. In January, 1920, the Albanians sent a delegation to Rome requesting Italian recognition of Albanian independence and territorial integrity in return for aid on the part of Albania in safeguarding Italian interests on the Adriatic. A reply was promised but never came and on January 20th Italy approved an agreement whereby Albania was to be distributed among Italy, Greece, and Jugo-Slavia. The last-named Power, however, rejected this agreement. In the course of the Adriatic dispute President Wilson had characterized the partition of Albania as a criminal act. Great indignation was aroused among the people. There were some clashes with the Italian troops which tried to prevent a meeting of the new assembly. This national assembly, however, succeeded in meeting January 28, 1920, and continued its session in spite of the objection of the Italians. It was there decided to overthrow the former government and replace it by one whose members were pledged to oppose all foreign interference whether Italian or not. It addressed a message to the Italian government saying that the people would not accept the humiliation of becoming an Italian colony and it sent appeals to the Allied Powers and the United States. The new government established itself at the inland city of Tirana. In the beginning of June, the Nitti government decided to withdraw Italian troops, but it did not withdraw them altogether, concentrating them at various Italian ports. Hostilities between the natives and troops resulted and on June 6th a general rising of the seaport populations began against Italian troops. In the first onset they drove the Italians from Alessio, Durazzo, Chimarra and Santi Quaranta. This revolt, however, broke out in the provinces which were not under the jurisdiction of the Albanian government and the latter therefore had nothing to do with the movement.

The above account of the Albanian view of the matter is based on the report by Constantin A. Chekrezi, commissioner to the United States on behalf of the new Albanian government. In the autumn negotiations were going on with the American government for recognition of her independence and with American banking concerns for a national loan. In the appeal to the American government it was argued that the Albanians were now law-abiding and showed a remarkable degree of political solidarity. The purpose of the proposed national loan was for the making of public improvements in general and in particular for the extension of the railways to afford connection with the Belgrade-Nish-Saloniki system, and for improving the conditions of the ports on the Adriatic. American aid was also sought for the establishment of an Albanian university.

On the last day of the year, an earthquake nearly destroyed the city of Elbassan. According to early reports, fourteen persons were killed, 300 injured and 10,000 rendered homeless. Supplies were promptly sent by the American Red Cross from the Adriatic coast. The city is in the centre of the region which a few weeks before had suffered severely from shock.

ALBANIAN. See PHILOLOGY.

ALBERTA. A province in the northwestern part of Canada which formerly made up a large part of what was known as the Northwest Ter-

ritories; east of British Columbia, west of Saskatchewan and north of the United States, having an area of 255,285 square miles and a population in 1916 of 496,525 of whom 307,776 were rural. The population was distributed between the sexes as follows: Males 277,256; females 219,269. Chief cities, with populations in 1916: Calgary (56,514); Edmonton (53,846). Edmonton is the capital. Vital statistics for 1918 were: Births, 14,890; deaths, 7924; marriages, 404.

The province was created by the Alberta Act of 1905 and according to the constitution, the executive power is vested nominally in the Lieutenant-Governor appointed by the Dominion government, but actually in the Executive Council or Cabinet of the Legislature; and the legislative power is vested in the assembly whose members are elected by universal suffrages, women having the right to vote. Lieutenant-Governor at the beginning of 1920, G. Brett; Prime Minister, Charles Stewart.

ALCOHOL AND NARCOTICS, SUBSTITUTES FOR. The elimination from the markets of these toxic habit-forming substances through Federal legislation will most certainly lead to efforts in the direction of harmless substitutes. The first evidence has been seen in an increased consumption of coffee and probably of tea. The active principle of these substances, caffeine, is also the active principle of other racial stimulants, notably Paraguay tea and the African kola nut. We are unable to state how much if any of the latter is present in some of the fountain drinks which make use of the name "kola"; or, rather, whether there is enough caffeine present to produce a stimulating effect. The only other type of racial stimulant in use with us is tobacco, the consumption of which is likely to increase with prohibition, despite the enormous amount of cigars and cigarettes formerly sold in saloons. We have recently read in the daily press that a company is being organized to exploit the Polyneesian stimulant known as *kava*. This, when abused, ranks with the natives as an intoxicant and narcotic, but until it is possible to demonstrate such destructive powers it might be possible to sell it in good faith or to trade, merely on its reputation. The drug has a limited sale for medicinal purposes, chiefly as a diuretic, and has never been in demand here as a stimulant or narcotic.

Ordinary food is the natural source of energy and a man physically and mentally depressed from fasting is rapidly energized by taking a warm meal even before the food can be converted into heat and muscular force. One of the leading causes of resort to alcohol has always been given as insufficient food, whether a quantitative deficit or the omission of some necessary constituent from the diet. The time is now fully ripe for the study of scientific feeding, owing to the recent discovery of specific food articles, whether glandular substances (internal secretions), vitamins, or the so-called end-products of digestion, termed aminoacids. Irrespective of these specific nutrient substances there is much to be learned in regard to ordinary food articles. Certain individuals can make sugar answer as a stimulant food although a meal composed of sugar alone would be repellent to the average man, who must have ballast food—something to distend mechanically the stomach—and must also have something on which to chew. Hence it is possible to devise a breakfast which will

utilize both theoretic and practical requirements. Experiment has shown that bulky food which requires much mastication is a direct stimulant of muscular energy. Fresh fruit like bananas, raw or cooked, or dried figs, which are themselves rich in sugars, may be sweetened in excess with table sugar, and eaten warm. A considerable amount of mastication is required and the result both as to immediate results and persistent effect may be all that is desired in cases where a conventional breakfast fails to satisfy. Certain individuals claim to derive an immediate stimulant effect from warm milk taken in sips, but it is only in very young nursing animals that the fluid seems to pass directly into the bloodstream without digestion. The restorative effect in these cases may be due in part to the continuous act of shipping, which is said to increase the blood pressure slightly, together with the introduction of a bland and edible substance into the empty stomach. It seems entirely reasonable to believe that the future man who seems unable to turn his food into energy will discover as a result of much experiment certain meals which will give him the desired result. Meals of this sort have the disadvantage of being fattening and here it is pertinent to state that to benefit by tonics and stimulants, including stimulating meals, an active life is a great advantage. An article like the preceding can only be made suggestive, for it is quite impossible to consider the subject in all its aspects.

ALEXANDER, CHARLES MCCALLON. British-American evangelist, died at Birmingham, England, October 13, 1920. He was considered by many to be the chief evangelistic singer in the English speaking world. He was born at Maryville, Tenn., Oct. 24, 1857, and engaged in evangelistic work in his youth. He was the successor of the American evangelical singer, Ira B. Sankey, who accompanied the late Dwight Moody in his tours. Mr. Alexander organized and conducted large chorus choirs for eight years and he accompanied the late Reverend Torrey in his tour of the world in 1902-06 in which he made one of his own compositions, the "Glory Song," famous everywhere. He made a second tour of the world with his wife in 1906-07 and later organized a vast evangelistic choir comprising some 4000 members in London. He compiled numerous volumes of gospel hymns; organized the Pocket Testament League which during the late war was said to have distributed a million new testaments among the troops; conducted united missions in Australia, China and other parts of the East as well as Great Britain and America, and before leaving America a few weeks before his death he began an extensive Bible revival campaign.

ALEXANDER. King of Greece, second son of Constantine I and of Queen Sophie, the sister of the former German emperor, died at Athens, October 25. His death was the result of wounds received in an attack by a pet monkey early in October. He was born August 1, 1893, and in the course of his education studied for a time at Oxford, England. Before his accession he was serving in the Greek army as a captain of artillery and was said to have made an excellent military record. As it was not expected that he would succeed to the throne over his eldest brother, he was not placed under much restraint and mingled with the people, by whom

he was generally liked. His early English association had an influence upon his choice as it was thought it would dispose him favorably toward the Allies. The elder brother, Prince George, Duke of Sparta, was passed over by the Allies in the belief that he was pro-German. When King Constantine's rule became insupportable to the Allies they notified him that he must abdicate in favor of his second son, Alexander, under pain of Allied recognition of the Venizelos provisional government over all Greece instead of merely over Saloniki. There were frequent rumors during Alexander's brief reign that he too was pro-German and that he sympathized with his father and mother; also, that he was violently opposed to certain policies of Venizelos. He entered into an irregular marriage with Mlle. Helen Manos, and there was much discussion over the question of regularizing it, certain popular papers urging parliament to do so, and the press that supported the former king, however, along with the aristocracy and the military, opposing it. English influence was reported as favoring it and French influence as opposed. While the controversy was continuing, the King was bitten by his pet monkey, October 2, and died of poisoning.

ALFALFA. Of the acreage of tame hay crops in the United States, according to estimates by the Department of Agriculture, over 20 per cent is now occupied by alfalfa, and in 1919 out of a total tame-hay population of 91,883,000 tons nearly 24,000,000 tons was alfalfa hay, a greater proportion than that furnished by any other hay crop, even the popular mixture of clover and timothy, which stands next. The tame-hay production for 1920 was placed at 91,193,000 tons and the average yield per acre was nearly the same as that of the preceding year, so that the production of alfalfa hay for the year was regarded about equal to that of 1919.

The leading alfalfa growing States are California, Nebraska, Colorado, and South Dakota, given in the decreasing order of importance. These five States furnish nearly one-half of the total production of the country. The prices of alfalfa hay during the earlier months of 1920, together with hay prices generally, ranged higher than ever before and reached an average on May 15 of \$25.68, the highest average price by States, \$45.60 per ton, being reached in South Carolina and the lowest, \$17.50 per ton, in New Mexico. The price of alfalfa seed in the spring of 1920 also was much higher than usual, reaching \$25.22 per bushel, as bought by farmers on April 15th, and \$24.68 per bushel as sold by them on March 15th.

During the fall of 1920, owing to some extent to favorable seasonal conditions resulting in good pasturage for an extended period, the demand for hay was comparatively small and the average price of alfalfa hay on October 15, 1920, was only \$18.03 per ton. This shrinkage in market value reduced sales and shipments and made trade in alfalfa hay rather dull. It was estimated that during the fiscal year ended June 30, 1920, about 20,000,000 pounds of alfalfa seed were imported, much of which met the high prices of the spring market, but the domestic crop of seed in the fall of the year encountered much lower prices and moved from the hands of the producers rather slowly. Alfalfa meal prices were low at this time and earlier in the year

due to transportation difficulties some of the larger alfalfa mills closed down.

The use of sulphur as a fertilizer for alfalfa attracted attention during the year and was reported as profitable. Progress was made in the control of the alfalfa weevil by the proper and timely spraying with solutions of arsenate of lead and other arsenicals and of the alfalfa caterpillar by timely close cutting, irrigating, and brush dragging.

ALGERIA. A French colony in northern Africa, comprising two main divisions, Northern and Southern Algeria, which are divided into departments and territories as follows: Northern Algeria (departments): Algiers, Oran, and Constantine; Southern Algeria (territories): Ain Sefra, Touggout, Ghardaria, and the Saharan Oases. The area including the territories in the south is estimated at 343,000 square miles. The population in 1914 was: Northern Algeria, 5,069,522; Southern Algeria, 494,306 total, 5,563,828, which included a native population of 4,740,526 and a European population of 752,043. Chief towns with population figures for 1912: Algiers (172,397); Oran (123,086); Constantine (65,173); (these three being respectively the capitals of the provinces of the same names); Bone (42,039); Sidibel-Abbes (30,942); Tlemcen (39,874); Blida (35,461). There is a university at Algiers which

phate rock, and antimony. Fisheries in 1917 employed 3480 persons. There is a considerable revenue from forest products, and stock-raising, especially of cattle, sheep, and goats, is important. See AGRICULTURE.

COMMERCE. The total value of Algerian foreign commerce in 1919, including goods in transit (*commerce générale*) amounted to 2,470,000,000 francs (\$476,710,000, normal exchange), which is 820,000,000 francs (\$158,280,000) greater than 1918 and 707,000,000 francs (\$136,451,000) in excess of 1917. The value of Algerian imports for internal consumption in 1919 was 943,055,000 francs (\$182,009,615), and the exports of the colony's products, 1,344,860,000 francs (\$259,557,980), a total of 2,287,915,000 francs (\$441,567,595) (*commerce spécial*), which is 758,860,000 francs (\$146,459,980) above 1918 and 751,990,000 francs (\$145,134,070) over 1917. These figures indicate a considerable recovery from the war conditions prevailing in the previous years. The increased economic activity of the colony was greatly facilitated by improved ocean communications, which made possible a marked gain in the volume of trade. The value of the trade of Algeria by classes of goods for the years 1918 and 1919, and a comparison with 1913, is given in the following table (all conversions in the report have been made at the normal rate of exchange, 1 franc equals \$0.193):

Groups	1913		1918		1919	
	Trade with France	Total trade	Trade with France	Total trade	Trade with France	Total trade
IMPORTS						
Animal products	\$4,634,128	\$8,192,271	\$4,317,445	\$7,687,383	\$10,775,576	\$14,328,706

Manufactures	1,954,125	6,184,299	1,558,282	9,579,555	3,484,229	14,746,744
Total	\$66,308,545	\$96,725,617	\$113,020,414	\$158,256,282	\$211,937,353	\$259,557,980

in 1918 had 675 students and 112 professors; and there are special schools for commerce, agriculture, fine arts, etc. The Mussulman schools in 1917-18 numbered 496, with 37,214 pupils. The primary and infant schools, public and private, in 1917-18 numbered 1305 with 146,508 pupils. The greater part of the country is of small value for agricultural purposes, the northern portion being mountainous and suitable chiefly for grazing and forestry, but there are highly fertile plains and valleys in a small area on the neighboring coast, and these are scientifically cultivated and for the most part owned by Europeans, the most profitable returns coming from vineyards and cereals. There is a varied system of land tenure, including metayage. The chief cereal crops are wheat, barley, oats, and maize, and there is also a considerable production of potatoes, beans, and other vegetables. Fruits abound including the orange, date, mandarin, citron, banana, pomegranate, almond, fig, etc.; and the mineral wealth comprises lead, zinc, mercury, copper, and tin ores. The latest figures for production available are for 1918 and 1919. The yield of wine in 1918 was 205,613,575 gallons. The total mineral output in 1918 was 1,041,817 metric tons, distributed chiefly among the following metals: Iron, zinc, lead, phos-

FINANCE. The following table gives the details of the 1920 ordinary budget:

Revenue		Francs
Taxes (direct)	49,400,585	
Taxes (indirect)	22,731,628	
State domain	10,510,212	
Customs	24,223,844	
Postal services	15,470,500	
Receipts d'ordre	26,574,150	
Special revenues	48,204,676	
Total (including all items)	204,671,801	
Expenditure		
Administration, debt	50,625,125	
Governor-General	23,958,356	
Interior	37,369,338	
Native affairs	8,908,881	
Finance	18,221,045	
Posts and Telegraphs	19,051,618	
Public Works	17,019,355	
Agriculture, etc.	6,149,429	
Railways	16,313,532	
Forests	5,985,180	
Total (including all items)	204,485,349	

The following information in regard to the total budgets (ordinary and extraordinary) was supplied by the United States Bureau of Foreign and Domestic Commerce: The Algerian

budget estimates for 1921, presented on May 17, 1920, by the governor-general at the opening of the session of the financial delegations, represented a serious effort to reestablish a proper balance between the receipts and expenditures of the colony. The general budget, which included both ordinary and extraordinary receipts and expenditures for 1921, was as follows: Receipts, 480,660,287 francs (\$92,767,435 at normal exchange); expenditures, 480,269,360 francs (\$92,091,986); surplus, 390,927 francs (\$75,449). In 1920 the receipts were fixed at 510,639,736 francs (\$98,553,469) and the expenditures at 510,629,736 francs (\$98,551,539). This reduction of 30,000,000 francs (\$5,790,000) in the 1921 budget applies only to the extraordinary items of the budget, as the ordinary budget for 1921 is 25,000,000 francs (\$4,825,000) greater than in 1920.

COMMUNICATIONS. The tonnage of vessels entered and cleared in 1919 is shown in the following table:

UNDER FRENCH FLAG		Entered	Cleared
France	1,245,044	1,497,598	
French possessions	74,193	74,179	
Foreign countries:			
European:	178,410	53,689	
Other	69,811	63,722	
Total	1,565,458	1,689,188	
UNDER FOREIGN FLAGS			
France	295,707	432,796	
French possessions	32,123	27,215	
Foreign countries:			
European	532,495	722,479	
Other	147,935	111,620	
Total	1,008,260	1,294,110	
Grand total	2,573,718	2,983,298	

Vessels entered in French and foreign trade in 1918 numbered 5360 with 2,762,290 tons net; vessels cleared, 5367 with 2,783,546 tons. The merchant marine in January, 1919, comprised 928 vessels of 14,627 tons net. On January 1, 1919, 2203 miles of railway were open for traffic, of which 807 miles were privately owned. Postal and telegraph statistics were not available for a later date than 1917, when there were 9151 miles of telegraph and 712 post offices.

GOVERNMENT. The administration is centralized at the capital Algiers under a governor-general who has charge of all services except the non-Mussulman services of the treasury, justice, public instruction, and worship. He is the chief executive authority and prepares the budget which is kept distinct from that of France and is voted by the Financial Delegations and the Superior Council. The Delegations which were established in 1898 represent respectively the French colonists, the French tax-payers who are not colonists, and the native Moslems. The Superior Council consists of elected members and the higher officials. There is a consultative council which assists the governor-general. The source of legislative power is the French parliament to which each department of Algeria sends one senator and two deputies. An improved civil status was bestowed on natives by the law of Feb. 4, 1914, according citizenship to those of them who had served in the war, who were proprietors or farmers, who could read or write, or who had received a French decoration. The governor-general in 1920 was M. Abel.

ALLEGHENY COLLEGE. An institution of the higher education, situated at Meadville, Pa., non-sectarian in policy, but under the control of the Methodist Episcopal Church; founded in 1815. The enrollment for 1920 was 536. The faculty numbered 34, three members having been added in the course of the past year. Productive funds amounted to \$1,010,000, and the income was \$172,000. The library contains 60,000 volumes. The total capital of the institution in 1920 was placed at \$3,010,000. President, Fred. W. Hixson, LL.D.

ALLEN, FREDERICK STURGES. Editor, died at Springfield, Mass., August 8. For many years he was engaged in the making of dictionaries and in 1915 won the gold medal for work in lexicography at the San Francisco Exhibition. He was born at Norwich, Conn., October 1, 1861, graduated at Yale College in 1884, and studied at the Yale Law School. He began his work as a lexicographer on the Webster publications in 1884; was contributor and editor of law articles in the *Johnson's Universal*, the *Appleton's Universal*, and the *NEW INTERNATIONAL ENCYCLOPEDIA*, and in the last-named was also editor of pronunciation. After that he returned to his work on the Webster publications. He wrote books on spelling reform and synonyms, and published a volume on the art of pronunciation in 1920.

ALLENTOWN, PA. See SEWERAGE AND SEWAGE PURIFICATION.

ALLIANCE FRANCAISE, 'FÉDÉRATION DE L'. Founded in 1902, this is an association of clubs, societies, and groups formed for the purpose of encouraging and furthering in the United States and Canada the study and cultivation of the language, literature, art, and history of France. During the year clubs were affiliated at Chattanooga, Tenn.; Huntington, W. Va.; Waterbury, Conn.; Randolph-Macon Woman's College, Lynchburg, Va.; Grinnell College, Grinnell, Iowa; and Westminster College, New Wilmington, Pa. Thirty more clubs and groups are about to be joined to the federation, which makes a total membership of clubs of 208. *L'Assemblée Générale Annuelle* was held in New York on April 10, 1920. It was proposed that the magazine *La France* be permitted to publish a supplement to its ordinary edition containing the news of the federation. The meeting was opened by a speech from M. Jusserand, the ambassador to the United States from France. During each year arrangements are made for a number of speakers to tour the country, visiting and speaking before the various clubs of the federation. This was again carried on in 1920. Among the officers of the federation may be mentioned the following: Honorary President, J. J. Jusserand; president of the Administrative Council, J. Le-Roy White; vice-president (Eastern States), Alexander T. Mason; general secretary, pro tem, Felix Weill. Headquarters are maintained at 2 Rector St., New York City.

ALSACE-LORRRAINE. A territory acquired after the War of the Nations by France, whose possession was confirmed by the Treaty of Versailles in 1919. From 1871 down to the end of the war it was an imperial territory, or *Reichsland*, of Germany and was divided into the three districts of Lower Alsace, Upper Alsace, and Lorraine. It was governed by a Statthalter appointed and removable by the Emperor, subject to the consent of the Diet, which consisted of two chambers, the first comprising nominated

members, and the second, sixty members elected by general direct suffrage. The area according to the German figures was 5605 square miles and the population in the German census of 1910 was 1,874,014, of whom the German-speaking were 1,634,260 and the French-speaking, 204,262. According to religion, the population was distributed in 1910 as follows: Catholics, 1,428,343; Protestants, 408,274; Jews, 30,483.

After the return of the territory to France it was divided into the departments of Bas-Rhin Alsace, with an area of 1848 square miles and a population given at 700,938; Haut-Rhin (1354 square miles; population, 517,865); and Moselle (2403 square miles; population, 655,211). By the law of October 17, 1919, the territories were placed provisionally under a commissioner-general until laws should be passed definitely incorporating them in France. The large cities with their population in 1910 were: Strassburg (178,891); Mulhausen or Mulhouse (105,488); and Metz (79,318). For the two last-named cities, however, the figures accepted by France in 1920 were somewhat lower. The head of the higher education is the University of Strassburg. After the return of the country to France it was reported that the French were making rapid progress in the introduction of the French system of education.

In 1919 and 1920, the administrative system was centralized under a commissary-general, aided by an advisory council. In the main, the government of Alsace-Lorraine retained the unity of the region and was taken as an example of so-called "regionalism." It was pronounced by its partisans to be very successful and they argued from it that similar measures for the preservation of regional unity should be taken for all the divisions of France.

According to a report of the commission on Alsace and Lorraine appointed by the French government, the production of potash salts in Alsace during the year 1919 was 591,471 tons, an increase of about 65 per cent over the production in 1913, which amounted to 350,341 tons. It was believed that this output would be greatly increased in 1920, as there has been a considerable decrease in production resulting from the difficulties connected with the transfer of the mines from German to French hands. The production of pure potash amounted in 1919 to 96,546 tons, of which 30 per cent was exported to the United States. Nearly all of the remainder was consumed in France. In August, 1920, the French Chamber passed a bill providing for the acquisition and equipment by the state of the potash mines of Alsace; and a credit of 75,000,000 francs was voted for this purpose. The mines had been down to that time sequestered and the measure looked to their continued exploitation.

There were a number of strikes in the spring in the Department of Haut-Rhin. At this time a large number of school teachers associated themselves with the working-class movements. Charges were brought against them and they were required to appear before a disciplinary tribunal which condemned them to pay a small fine. The trial brought out the fact that the school teachers had some just grievances.

ALUMINUM AND BAUXITE. The quantity of bauxite marketed in the United States in 1919 was 376,566 long tons, which had a value at the mines of \$2,201,747, a decrease from the pro-

duction of 1918 of about 38 per cent in quantity and about 36 per cent in value. The production in Georgia, Alabama, and Tennessee in 1919 was 43,076 long tons, an increase of less than 1 per cent, but the production in Arkansas was only 333,490 long tons, a decrease of about 41 per cent. The United States has for years led in the world's production. The domestic consumption of bauxite in 1919 was about 38 per cent less than that in 1918. Considerable bauxite was imported from South America. Most of the bauxite exported, which included bauxite concentrates, was apparently shipped to Canadian producers of aluminum and abrasives. The prices received for bauxite in 1919, as reported by producers, ranged from \$5.45 to \$12 a long ton; the average price paid for all the domestic bauxite sold in this country was \$5.85 a long ton at the shipping point. The bauxite deposits of the United States are in central Arkansas, northeastern Alabama, northwestern Georgia, southern-central Tennessee, central and central-western Georgia, and northeastern Tennessee. The bauxite from all localities in the United States, though it may vary in chemical composition, is on the whole similar in general appearance, with the exception of the "granitic bauxite" of the Arkansas field. The greater part of the American bauxite appears to be made up of rounded pebble-like bodies set in a fine-grained matrix, which may also consist of small rounded particles or may be as fine grained as the finest clay. The pebble or pisolite form is so general that it is the conspicuous characteristic of American bauxite. The value of bauxite can be determined only by chemical analysis, which should show total silica, alumina, titanium oxide, iron oxide, and water.

The value of primary aluminum produced in the United States in 1919 was \$38,558,000, a decrease of about 6 per cent from the value of the output in 1918. The decrease was due largely to curtailment in the production of aluminum forced by the accumulation of large stocks in the preceding year. Exports of aluminum and manufactures of aluminum in 1919, \$3,890,326; imports for consumption, \$4,568,595. The demand for aluminum during the war was large, owing to the extensive use of aluminum in the automotive industry. Aluminum was released in 1919 for some uses that had been poorly supplied during 1917 and 1918, as they were not essential to war activities. The principal aluminum salts made in the United States are alumina, alums (mainly ammonium and sodium alums), aluminum sulphate, and aluminum chloride. Alums of various qualities are produced at eight plants in the eastern United States, and the total production of alum in 1919 was 17,019 short tons, valued at \$879,198, a decrease of approximately 16 per cent in quantity and value from the production in 1918. The average price reported by makers of alums was \$51.66 a short ton. Aluminum sulphate is made at 23 plants, five of which are at municipal or industrial waterworks, which consume their entire output. The total quantity of aluminum sulphate produced in the United States in 1919 was 200,034 short tons, of which 4725 short tons did not enter the market but was used for purifying water at the place of manufacture. The quantity of domestic aluminum sulphate that entered the market in 1919—195,309 short tons—was less than the quantity in 1918 by about

33 per cent, and the total domestic production decreased about 1 per cent. The price reported by makers of aluminum sulphate for the output in 1919 averaged \$33.80 a short ton. Aluminum chloride was produced at three plants in 1919, and the total output reported to the Geological Survey was 4806 short tons, valued at \$371,850. This is an increase of 14 per cent in quantity and 10 per cent in value over the output in 1918.

AMETTE, LEON ADOLPHE. Cardinal and archbishop of Paris, died in Paris, August 29. He was born at Douville, September 6, 1850. After studying at the Seminary of St. Sulpice in Paris he was ordained priest (1873); was made vicar of the cathedral and secretary of the archbishopric of Paris in 1886; ordained bishop, January 25, 1899; and succeeded Cardinal Richard as archbishop of Paris, January 28, 1908. He was made cardinal, November 27, 1911. His funeral, attended by representatives of the principal political parties and of the government, was celebrated in Paris, September 4th. The occasion was remarkable as the first time in fifty years that the state had associated itself in the public mourning for death of a Catholic archbishop. The spirit shown in the French community at the time of his death was taken by many to indicate that the spirit of public religious division had come to an end. Since the year 1905 the state, officially at least, had ignored the church and for nearly half a century the state and the church had been in a hostile attitude to one another. The government participation in the funeral was acclaimed by the government's supporters as a sign that the *Union Sacrée* formed in war time had produced enduring results.

AMHERST COLLEGE. An institution of the higher learning, situated at Amherst, Mass., where it was founded in 1821. Students enrolled for the year 1920-21 numbered 503 (allowing for duplication). There were 63 members of the faculty. Productive funds, \$4,434,000; income for the year, \$372,000. The library contained 125,000 volumes. Courses of instruction are all-year courses, with final examinations in June covering the work of the entire year. During the year the president was on leave of absence and Dean George Daniel Olds was acting president. The college was preparing for the celebration on June 20-22, 1921, of the 100th anniversary of its founding and its alumni were raising a fund of \$3,000,000 as a gift in honor of that occasion. President, Alexander Meiklejohn, Ph.D., LL.D.

ANÆMIA, SURGICAL TREATMENT OF. While ordinarily regarded as a symptom rather than

a disease, there is a group of so-called primary anæmias the causes of which are unknown. Because of the very serious and practically hopeless outlook in these cases, and the attempts to cure many of them by removal of the spleen and other surgical procedures the subject of primary anæmia will become one of increasing importance. In addition to forms in which the term pernicious is applied there are other forms of so-called primary anæmia which are traceable in some cases to the spleen, while others are characterized by jaundice which masks the anæmia to some extent. Finally the chlorosis of young girls is reckoned among the primary anæmias. With the exception of the latter, which is sharply marked off from the others and may also be cured or outgrown, the primary anæmias present much the same picture among themselves in addition to bearing a close resemblance to some of the secondary anæmias, such for example as that due to a form of tapeworm. In some of the latter cases removal of the parasites does not cure the disease.

The subject of the anæmias is far too complicated and involved to be discussed in a work of general reference, and the only factor of popular interest is the possibility of surgical relief, which often holds out the sole hope of recovery. At one period the term surgical treatment would have implied only the extirpation of the spleen in selected cases. More recently it has been claimed that certain cases can be traced to foci of chronic suppuration in the body, and the latter have been extirpated. Autopsy upon victims of pernicious anæmia has sometimes resulted in the discovery of septic mouth or other possible nidus of poison. If such a causal connection could be proved such cases would of course be classed as secondary anæmias. Thus far excision or other removal of such foci has produced only transitory benefit and we cannot be sure that these focal conditions are really the cause of the anæmia; the latter is often without any suggestion of accompanying disease processes, save those which are secondary to the anæmia itself. Moreover oral sepsis is so extremely common that its presence may usually be set down to coincidence.

The number of cases in which the spleen has been removed in the hope of curing or arresting pernicious anæmia must now be very large and counted in hundreds. Thus far it is not known that any permanent cure has been obtained, although not infrequently the patient has received an extension of life. Taken as a whole it is not certain that the average benefit or aggregate benefit has offset the undesirable results, operative risk, expense, etc.

There is a third surgical resource in pernicious anæmia and that is blood transfusion. Originally and not so long ago the field of this resource was thought to be limited to acute losses of blood. Recently systematic transfusion has been shown to be our best resource against these disease forms. The improvement which follows is usually considerable and the operation may be repeated at intervals. The patients have sometimes left their beds and resumed business for a short period. But the improvement is not lasting nor are all the symptoms relieved. The donor of the blood must be of the same blood type as the patient and whole blood must be transfused. This resource has a great advantage over extirpation of the spleen because applicable

to all cases of anemia. The spleen is not to be removed unless there is reason to believe that the organ is in some way responsible for the blood state—in other words unless the condition belongs under splenic anemia. It is probable, however, that in some cases the operation has been practiced as a last resort without any refinements of diagnosis. The many total failures also suggest that the diagnosis may at times have been at fault despite all care.

ANALYTICAL CHEMISTRY. See CHEMISTRY.

ANATOLIA, or **ASIA MINOR**. That part of the former Turkish Empire which consists of a peninsula at the western extremity of Asia, bounded by the Black Sea on the north and east and by the Mediterranean on the west, with an area variously estimated at from 196,000 to 199,272 square miles and a population estimated at from 9,000,000 to 10,186,900, of whom about 7,000,000 are Turks. The component parts or vilayets with their estimated area and population are as follows: Brussa, area 25,400 square miles, population, 1,626,800; Smyrna (Aidin), area, 25,801, population, 2,500,000; Konia, area, 30,410, population, 1,069,000; Angora, area, 27,370, population, 932,800; Adana, area, 15,400, population, 422,400; Sivas, area, 23,970, population, 1,067,500; Trebizond, area, 16,671, population, 1,265,000; and Kastamuni, area, 19,570, population, 961,200; and there are also the two sanjaks of Ismid (area, 3130, population, 222,700), and Bigha (area, 2550, population, 129,500).

Anatolia is the purely Turkish portion of the former Ottoman Empire and after the war was considered as the only proper base of the new Turkish state. In 1919 and 1920, however, it was overrun by Nationalist troops under Mustafa Kemal. See **WAR OF THE NATIONS**, and **TURKEY**.

ANDREWS, **WILLIAM LORING**. American author, died March 20. He was born in New York State, September 9, 1837, and was educated in private schools. He was a trustee of the Metropolitan Museum of Art and a member of various other important associations. He wrote a variety of books pertaining to local history, book collecting, engraving, early American history, bibliography, etc.

ANEMIA. See **ANÆMIA**.

ANGLICAN CHURCH. See **ENGLAND**, **CHURCH OF**.

ANGOLA, or **PORTUGUESE WEST AFRICA**. A Portuguese colony on the western coast of Africa; bounded by French Congo, Belgian Congo, the Union of South Africa, and the former German colonies of Southwest Africa, and having a coast line of about 1000 miles. The boundaries were fixed by conventions on May 12, 1896, May 9, 1891, and June 11, 1891, as regards French and British possessions, and on Dec. 30, 1896, as regards the frontier with Southwest Africa. The estimated area is 484,800 to 490,000 square miles and estimated population, 4,120,000. Capital, St. Paul de Loanda; other important towns, Cabinda, Ambriz, Novo Redondo, Benguella, Port Alexander. The native population in 1914 was placed at 2,124,361. The military force maintained there has varied in number, between 2712 and 4731, the majority being natives. The chief products are coffee, rubber, wax, sugar, vegetable oils, ivory, coconuts, oxen, and fish. Rubber was formerly the chief industry, but

latterly the supply has been exhausted. There are ample supplies of copper, petroleum, iron, and salt, and malachite and gold have been found. Trade is mainly with Portugal. Textiles are the chief imports and coffee the chief export. In 1917-18, the revenue was estimated at 13,435,221 escudos and the expenditure at 16,418,413 escudos. Railway opened for traffic was 818 miles. The carrying trade has been largely in the hands of the Portuguese National Navigation Company. There is a cable connection between the colony and the telegraph systems of East, West, and South Africa. The Trans-African railway was purchased by the government in July, 1918. The colony has been in the possession of Portugal since 1875 except for a few years in the seventeenth century, when it was held by the Dutch. The administration is in the hands of a governor-general, whose seat is at St. Paul de Loanda, and for administrative purposes it is divided into nine districts.

ANHALT. A free state of Germany, formerly a duchy of the German empire, bounded by the Prussian provinces of Brandenburg and Saxony; with an area of 888 square miles and a population of 331,128. Capital, Dessau, with an estimated population of 56,605; other cities, Bernburg (33,724); Cöthen (23,416); and Zerbst (19,210). The great majority of the population are Protestants. The estimated income and expenditure for 1919-20 was £1,472,000. Before the war the executive power was in a duke and legislation in a diet of 36 members. In 1918 the system of government was changed, the duchy was declared a republic and the people voted for the Constituent Assembly. A constitution was created July 18, 1919, in accordance with which the diet is elected by popular vote for three years and the executive power is placed in a state council of five members, under a chairman who has the title of president.

AND **VETERINARY MEDICINE**.

ANIMAL INDUSTRY. See **LIVE STOCK**.

ANNAM. A French protectorate constituting part of French Indo-China (q.v.), acquired by France under the treaty of 1884. Area, about 52,100 square miles, with a population in 1914 of 5,200,000, including 2117 Europeans. The capital is Hué (60,711); the largest town, Binh-Dinh (74,000). Along the coast in the towns, the population is Annamite and the highlands consist of Moi tribes. Agriculture is carried on chiefly in the interior where irrigation has been introduced. The products are cotton, rice, corn and other cereals, nuts, spices, sugar, betel, and manioc, and there is an abundance of timber and various vines and medicinal herbs, also a considerable production of raw silk. As to the mineral wealth, there are mines of iron, copper, zinc, and gold which are worked by the natives, and coal mines are found in the neighborhood of Tourane. Salt also is obtained. Besides numerous village schools there is a school of law and administration and a high school for boys and one for girls. In 1919 there were 108 primary schools with 5200 pupils, for boys, and 12 primary schools with 384 pupils for girls. In 1919 the local budget balanced at 5,723,139 piastres. In 1918 the imports amounted to 5,067,518 francs and the exports to 8,705,679 francs; the principal imports being cotton yarn, cottons, petroleum, tea, paper goods, and tobacco; and the chief exports being rice, sugar, cotton, silk, tea, cinnamon, and paper. At the head of the government

is the King, Khai-Dinh, who came to the throne in 1916, and who is assisted by a council of ministers, but his authority is not final, and must conform to the wishes of the French government. The administration is largely in the hands of Annamite officials under the control of the French government.

ANTARCTIC REGIONS. See POLAR RESEARCH.

ANTHROPOLOGY. In spite of economically unfavorable conditions anthropology continues to thrive in academic centres. The registration in the elementary course at the University of California reached the record-breaking figure of 784, and in the University of Washington (Seattle) an ambitious scheme of anthropological courses is offered by Dr. L. Spier under the auspices of the sociological department. A marked increase in attendance is reported from Barnard College. Columbia offers a number of new courses, among them a practicum in physical anthropology by Dr. B. Oettking. The New School for Social Research in New York has introduced anthropology into the curriculum, with Dr. A. A. Goldenweiser as the lecturer. Signs of transatlantic activity are not lacking. The new university at Hamburg has lectures on African languages, physical anthropology and ethnology, and at Munich Drs. W. Lehmann and L. Frobenius have founded an ethnological research institute. A movement is on foot to introduce anthropology into the curriculum of the University of New Zealand. A special turn in the development of anthropological interest is witnessed in the application of the science to Americanization problems, in which field Prof. A. E. Jenks of the University of Minnesota is the leader. The practical utility of anthropology to the state is likewise the main theme of the presidential address to the Anthropological Section of the British Association for the Advancement of Science (*Science*, 1920, vol. LII, pp. 371-376) by Karl Pearson, who insists on the possible services of the anthropologist as a vocational guide.

The rapprochement between ethnology and psychoanalysis continues. Dr. Rivers's recent visit to this country (see below) was made largely for the purpose of lecturing on psychoanalysis. In America Prof. A. L. Kroeber is devoting himself to a serious study of psychoanalysis, and Dr. A. A. Goldenweiser has delivered a series of lectures on the subject.

PHYSICAL ANTHROPOLOGY; ANTIQUITY OF MAN. Prof. Arthur Keith (Presidential Address to the Anthropological Section, Brit. Assoc. Adv. Science) has discussed "The Differentiation of Mankind into Racial Types." He suggests that the evolutionary mechanism is inadequate to explain the origin of races and derives them from peculiarities of the ductless glands, which have been shown to produce far-reaching effects in bodily conformation. Thus, he interprets the sharp nasalization, prominent chin and brow-ridges of the Caucasian in terms of pituitary function, the pituitary gland being attached to the base of the brain. On the other hand, an affection of the thyroid produces a yellowish tint, loss of hair, and a reduction of the nose—in short, Mongoloid features. Again, the long stork-like legs of the Nilotic Negroes may be due to the action of the interstitial glands embedded within the substance of the testicle and ovary. In a pamphlet on "Nationality and Race from an Anthropologist's

Point of View" the same author rapidly surveys the practical problems that have arisen in different parts of the globe through the contact of distinct groups, with special reference to the Irish question. Scientifically his most important statement is that the differences between Irish and British are purely cultural, the physical types being indistinguishable both in living representatives and in the remains of ancient graves. Further, the contention that of all the populations of the British Isles the Irish are the purest representatives of the Nordic stock is of considerable interest.

A contribution to the problem of racial classification is made by Fritz Paudler (*Anthropos*, XII-XIII, pp. 641-694), in a paper entitled "Cro-Magnon Studien." He contends that the Cro-Magnon types, characterized by long-headedness and a broad face, has not disappeared in prehistoric times but persists in a tall, blond "Dal" and a short, dark "Ber" race, the former name being derived from the Dalarna district of Sweden, the latter from the Berber country in North Africa. These varieties are said to represent two additional European races in addition to the Nordic, Alpine, and Mediterranean.

Anthropometric work similar to that popular on the Continent in recent years has been attempted by Prof. F. G. Parsons in England. His "Anthropological Observations on German Prisoners of War" confirm the previous impression that the Nordic type is found purest in the north-western part of Germany, while elsewhere the Alpine stock predominates. Thus, the cephalic index while nowhere attaining the British figure of 78.24 approaches it most nearly in Westphalia (80.4), Oldenburg (80.6), Schleswig-Holstein (81.0), and Brunswick (80.1). The region of long-headedness also coincides with that of fair hair, rubescence e.g. being twice as frequent in the dolichocephalic area. Finally, the greatest stature averages 5 feet 8.1 inches and 5 feet 7.8 inches are associated with Mecklenburg and Schleswig-Holstein, while the lowest, 5 feet 6.1 inches, is found in Wurtemberg. In short, there has been a gradual replacement of the Nordics in a large part of Germany by a shorter and darker type.

In a treatise entitled "Anthropometry of the Siouan Tribes" (*Anthrop. Papers*, Amer. Mus. Nat. Hist., vol. XXIII, pt. 3) L. R. Sullivan arrives at some interesting conclusions. A comparison of 17 local groups of Dakota Indians shows that they all represent a single physical type. The half-bloods are taller than the pure Indians and in those characters in which the two races differ most markedly the half-bloods stand closer to the Indians than to the whites. Compared with other Indian tribes, the Dakota rank as tall, with a mean stature of 172.4 cm. In this, as well as in all other traits, they correspond very closely to the Ojibwa. The cephalic index of 79.6 is identical for the two tribes.

Some suggestive observations are recorded in L. R. Sullivan's paper on "The Fossa Pharyngea in American Indian Crania" (*Amer. Anthropol.*, vol. XXII, pp. 237 seq.). The fossa pharyngea is a small depression in the ventral surface of the occipital bone. It is rather uncommon in European skulls, for which the percentage of 1.3 has been reported. Sullivan finds that for the prehistoric Basketmakers of Utah the figure rises to 26.8 and remains very high for a number of other Southwestern, as well as Mexican, groups.

It appears that this otherwise rare feature is associated especially with people speaking Aztec languages.

Important results bearing on the history of the Paleolithic technique are stated in preliminary announcements by J. Bayer (*Mannus*, XI-XII, pp. 215-223; *Zeitschrift für Ethnologie*, LI, 1919, pp. 163-178). Previous investigators have frequently inferred that the implements of Paleolithic craftsmanship in other continents can be chronologically equated with their equivalents in Europe. This conclusion is rejected by Bayer, who found in Palestine and Syria Chellean implements in association with post-placial loess-like material and with strangely slight patination. Faunistically similar finds in Phœnicia are associated with the cave-bear and *Rhinoceros tichorhinus*, i.e. they belong to the most recent diluvial period. The supposed Paleoliths are accordingly synchronous with the Campignien of Europe and represent a proto-Neolithic culture. This is established technologically by their association with transitional types suggesting the Neolithic ax, but also by a peculiar method of retouching wholly unlike anything belonging to the Old Stone Age and with a Campignien counterpart. Bayer contends that wherever a Paleolithic era has been assumed outside of Europe and possibly a small section of Africa, the cultural remains belong to his proto-Neolithic stage. In other words, the Old Stone Age is restricted to western Europe, which thus figures as the cradle of human culture. The Late Paleolithic Age is likewise unrepresented in other continents. Its culture probably evolved in northeastern Europe (Russia) and thence spread southwards. That is to say, while western Europe in the last interglacial period but one displayed the Old Paleolithic culture, the germs of the Aurignacian evolved in the north and northeast and spread thence during the Riss glacial period; and during the last interglacial period the Late Paleolithic culture gained complete dominance. The proto-Neolithic culture, on the other hand, is derived from Africa and is supposed to have been diffused in various directions.

GENERAL ETHNOLOGY. The problem of convergence is treated in Von Luschan's monograph on "Zusammenhänge und Konvergenz" (*Mitteil. der Anthropol. Gesellschaft, in Wien*, 3d series, vol. XVIII). Von Luschan identifies convergence with parallelism or independent development. He does not favor either of the rival theories of Genetic connection and convergence wholesale, but decides each case on its merits. As regards proof of the former, he relies largely on the coincidence of linguistic affinity, musical technique and mythological identities with the similarity of the cultural trait studied. Thus the supposed linguistic relationship of Hottentot and Hamitic tongues leads him to postulate a far-reaching cultural relationship. Notable instances of diffusion in his scheme are the composite bow, which has been carried from Egypt or Asia Minor to other parts of Eurasia and to western America and the technique of weaving, which he assumes to have evolved in the Orient and to have entered America in pre-Columbian times. He also argues for Mediterranean influence on the cultures of tropical West Africa. In a commentary on Von Luschan's monograph, K. Weule (Petermanns *Mitteilungen*, pp. 69-77, 153-157), while in part accepting the diffusionist point of

view, refuses to ally himself wholly with Graebner's school which, he insists, concentrates all its attention on a limited part of the legitimate field of inquiry.

W. H. R. Rivers's paper on "History and Ethnology" (*History*, July, 1920, pp. 65-80) elucidates the relations of these two branches of knowledge from the point of view of the British historical school. As distinguished from the Germans headed by Graebner, this group is not necessarily opposed to evolutionary conceptions, though it necessarily objects to the simplicity of the schemes by which the older anthropologists sought to summarize the course of cultural progress. By the use of an analysis based on the manner in which cultural features are associated, Rivers contends that it is possible to establish a genuine history. This will indeed be devoid of personal reference and will present a relative rather than an absolute chronology. Nevertheless it will be history and by a skillful combination of ethnological and documentary evidence it may even be possible to assign approximate dates to the events ethnology registers.

A quite different aspect of British anthropological thinking appears in R. R. Marett's book on *Psychology and Folk-Lore*. Diffusion, on which Rivers concentrates his attention, is here regarded as only furnishing a preliminary to psychological inquiry as to the processes involved in the acceptance of a custom or belief. Survivals are likewise treated from a psychological point of view, i.e. with reference to the motives tending to preserve them. Marett holds with Goldenweiser that the weird conceptions of primitive philosophy must not blind us to the knowledge actually possessed by primitive man. Only we must look for it in the right place. For example, he suggests that in ruder levels the predecessor of the physician should be sought not among the shamans but among the herb-gathering laity.

The extraordinary development of the anthropological department at the University of California has necessitated the publication of a *Source Book in Anthropology*, compiled by Professors A. L. Kroeber and T. T. Waterman primarily for their own classes, but in the absence of an up-to-date summary of results this collection is likely to take the place of a general text-book.

A synthesis of our present knowledge of sociology in the simpler cultures is attempted in R. H. Lowie's *Primitive Society*. It represents essentially the modern American point of view and specifically repudiates the principal tenets set forth in Morgan's *Ancient Society*. More particularly, Lowie rejects the hypothesis of primeval promiscuity, the priority of maternal descent, the lack of territorial organization among the ruder peoples, and the theory that all property was once held communally. In general the principle of diffusion is shown to interfere with any fixed sequence of stages, hence all evolutionary schemes are repudiated. A critique is offered of the economic interpretation of history, mainly on the basis of the far-reaching influence of the craving for prestige. The origin of the state is traced to the effects of "associations," i.e. clubs, fraternities, and other organizations of this type, which would assemble together the members of a local group. In contradistinction to Maine and Morgan, Lowie thus recognizes a territorial or political organization as a concomitant of the kindred organization frequently regarded as sole-

ly characteristic of primitive peoples. This last conception, viz., that a territorial bond exists in the ruder societies has also been voiced by A. A. Goldenweiser in his essay on "A New Approach to History" (*Amer. Anthropol.*, 1920, pp. 26-47), which is more particularly devoted to a critical scrutiny of F. J. Teggart's historical theories.

As evidence of the demand for synthetic treatises may be cited the publication of the late A. H. Keane's *Man, Past and Present*, as revised by Mrs. A. Hington Quiggin with the assistance of A. C. Haddon.

Father W. Koppers (*Anthropos*, X-XI, 611-651, 971-1079) devotes a substantial paper to "Die ethnologische Wirtschaftsforschung," i.e. the ethnological investigation of primitive economic conditions. He rejects with Hahn the hopelessly antiquated view that husbandry grew invariably out of pastoral life, and develops novel views on the basis of Graebner's and Schmidt's studies. More particularly, he assumes with Schmidt that the pristine culture of mankind branched out into three distinct types—one characterized by maternal descent and the bow, the second by patrilineal descent and totemism, the third by the domestication of animals.

AMERICA. The intricate question of "The Social Organization of the Kwakiutl" (*Amer. Anth.*, 1920, pp. 111-126) is clarified in Prof. F. Boas's most recent exposition. The Kwakiutl are divided into units called *numaym*, each characterized by a number of honorific positions, involving titles and privileges, which must be filled. The basic principle of succession is primogeniture, but its operation is modified by the dowry system, through which the father-in-law transfers privileges to his son-in-law or a member of the son-in-law's family. The privileges are individually owned, never by the whole *numaym*, and there is never a totemic relationship between the entire group and the crest which is attached only to certain individuals of high rank. In this regard the Kwakiutl usage corresponds to that of the Nootka rather than of the more northern Coastal tribes. The same line of cleavage appears in the kinship nomenclature; Kwakiutl and Nootka do not differentiate paternal and maternal kin, who are strictly separated by the Tlingit, Haida, and Tsimshian.

The, ultimate relations of Californian aborigines are illuminated in Kroeber's paper on "California Culture Provinces" (*University of Cal. Pub.*, vol. XVII, pp. 151-169). While it had been customary to distinguish three cultural provinces in California, Kroeber now attempts to indicate their affiliations outside the State boundaries. From a broader point of view Northwestern California is seen to form but part of a larger area embracing a large section of Southwestern Oregon and this interstate province itself must be conceived as a portion of the area whose cultural centre lies in coastal British Columbia. Similarly, the Southern Californian culture, with its two sub-types of the Colorado and the coast, appears as a remote relative of the cultures of New Mexico and Arizona. Oddly enough, the Colorado tribes in spite of their geographical proximity present no greater affinity with Arizona than do the coastal Gabriélino. While the former share such Southwestern traits as agriculture, totemic clans, and shields, the coastal people have the sweat-house estufa, the

sand-painting, and an organized and initiating cult society, all of which are lacking on the lower Colorado. Finally the great central Californian region must be extended indefinitely to the eastward to embrace Nevada and part of Utah. Here, however, the relative status of the Californian populations is reversed; while in the northwest and the south they appear as borrowers, the central tribes are in the ascendancy as compared with their neighbors of the Basin and may be assumed to have influenced them.

"The Cahuilla Indians" (*Univ. of Cal. Pub., Amer. Arch. and Eth.*, XVI, pp. 315-380) by Lucile Hooper gives an account of one of the largest surviving South Californian tribes, particularly of the Desert division living about or even below sea level. It appears from this study that the Desert Cahuilla share the culture of fellow-Shoshonean populations in Southern California rather than either with the Shoshonean nomads of the Great Basin or the alien Yuman tribes to the east. The Cahuilla were not agricultural prior to the advent of the Spaniards but depended for food mainly on the beans of the mesquite tree. They manufactured pottery and basketry but both arts have become obsolete. There is a girls' puberty ceremony during which, as well as during later menstrual periods, the girls must abstain from eating meat and from scratching themselves with their fingers. Boys are also initiated about adolescence, being instructed in singing and dancing and also as to proper conduct. The great ceremony of the tribe was the annual mourning for persons who died during the year and whose effigies were carried about and ultimately burned.

Although primarily conceived as a study of aboriginal place names, T. T. Waterman's "Yurok Geography" (*Univ. of Cal. Pub.*, vol. XVI, pp. 177-314) presents a great deal of general ethnographic information. The outstanding fact is the cultural affinity of the people, however remote, with the Coastal tribes of British Columbia. This appears especially in the predominance of certain conceptions regarding wealth. Individual property is recognized as to land—specifically as to fishing places, acorn fields, and snaring places. The first-mentioned more particularly could be sold, bartered, and bequeathed. Sometimes the same spot was owned by one individual for salmon-taking purposes and by another for catching eels. It was possible to will property outside the family and certain rights were acquired by marriage. In addition there was of course inheritance, which occurred in both the paternal and the maternal line. In consequence the total holdings of a single individual might come to be widely scattered.

Relatively little has been published on the Plains Indians. The sun dance of various tribes of this region is described in a series of minor papers by Goddard, Skinner, Wallis, and Lowie (*Anthropological Papers, American Mus. of Natural History*, vol. XVI, pts. 4, 5). A detailed account of "The Tobacco Society of the Crow Indians" (*ibid.*, vol. XXI, pt. 2) has been prepared by R. H. Lowie. The significant fact develops that the sacred tobacco plant of the Crow is botanically related to a Californian species and that the term for "tobacco" is practically identical among the Crow of Montana, the Takelma of Southern Oregon, the Shasta and Diegueño of California.

In the "Notes on Cochiti, New Mexico" by the late Father Noel Dumarest, translated and annotated by Dr. Elsie Clews Parsons (*Memoirs, Amer. Anth. Assn.*, vol. VI, n. 3), the ethnologist has acquired an excellent sketch of the religious and social life of a hitherto little-known Keresan people, as well as a serviceable introduction to the study of Southwestern culture generally. Clan descent at Cochiti is matrilineal, but marriage is patrilocal. There is a tribal society into which all males but no women are initiated. It is this organization that produces rain by impersonating the supernatural beings, i.e. specifically the dead, who can grant rain, health, and welfare. The women and children believe that the masked actors are the gods themselves and the men at least hold that by donning the sacred regalia they assume a holy character. Quite distinct from this society are the curing fraternities into which women are admitted. Their function is to extract the rattlesnakes, stones, and other objects conjured into the patient's body by evil magicians, of whom the natives stand in morbid fear. The oldest member of one of these organizations serves as "cacique" or spiritual head of the community. He is an honored but by no means absolute official, since he may be punished for transgressions of customary law. He himself is free from executive work but appoints an annual governor and other administrative officers. In his spiritual labors he has the assistance of the war priest, always chosen from those who are not members of the curing fraternities. This priest advises the cacique and with his deputies forms a sort of ritualistic police, since he supervises and organizes the masked dances.

Especially valuable from the psychological point of view is "The Autobiography of a Winnebago Indian," edited and annotated by P. Radin (*Univ. of Cal. Pub.*, vol. XVI, pp. 381-473). It reveals from the inside the workings of a culture from the Woodland-Plains border area, as well as the transformations wrought by modern conditions, especially by the recent Peyote religion in which ancient Winnebago faiths blend with Christian conceptions. An interesting field report by A. B. Skinner on the "Medicine Ceremony of the Menomini, Iowa, and Wahpeton Dakota" (*Indian Notes and Monographs*, vol. IV) is devoted to the religious life of the same region.

In his "Decorative Art and Basketry of the Cherokee" (*Bulletin, Public Museum of the City of Milwaukee*, vol. II, no. 2), F. G. Speck traces the gradual diffusion of cane basketry. He finds the industry to have centred in the Lower Mississippi region, though its ultimate place of origin may lie in the Antilles or even in South America. The Iroquois, whose southern derivation is now generally accepted, may be regarded as the carriers of the technique to more northern localities, but naturally the cane material of the South was supplanted by splints of oak and ash.

Baron Erland Nordenskiöld has published a sequel to earlier South American researches under the caption of *The Changes in the Material Culture of Two Indian Tribes under the Influence of New Surroundings*, the new volumes being dedicated to the Chiriguano and Chané tribes, the former representing the Guaraní stock, and the latter the Arawakan. The Chiriguano entered the borderland of Bolivia and the Argentine Republic in the sixteenth century, subduing the

native Chané population. Nordenskiöld studies the mutual influence of the two cultures thus brought into intimate contact, as well as the later effects due to European and Negro intrusions.

In "Notes on the Bribri of Costa Rica" (*Indian Notes and Monographs*, vol. VI, no. 3) A. Skinner offers observations on the material existence, social and ceremonial life of this Chibchan people. They are divided into exogamous matrilineal moieties subdivided into lesser clans. Mortuary ceremonies still figure prominently and notions of taboo and ritual uncleanness are in full swing.

Under the caption of *The Mythology of All Races: Latin American*, forming volume XI of the series, H. A. Alexander presents the first up-to-date summary of Central and South American myths. "The Sources and Authenticity of the History of the Ancient Mexicans" (*Univ. of Cal. Pub.*, vol. XVII, pp. 1-150) are dealt with by P. Radin, who in a measure seeks to vindicate the trustworthiness of aboriginal accounts of ostensibly historical character.

OTHER CONTINENTS. A valuable study of an unusual character is embodied in Martha W. Beckwith's "The Hawaiian Romance of Laieikawai" (*33rd Ann. Rept., Bur. Am. Ethnol.*). It presents not merely the original text and a translation of a lengthy Hawaiian tale, but also a detailed commentary together with an investigation of Hawaiian literary style and activity. Much of the material of Hawaiian literature is found to be traditional among other Polynesians. It mirrors the aristocratic polity of the Hawaiian, verse-making having indeed been practiced in the households of chiefs. The theme is usually the career of a hero whose supernatural powers are established in a series of contests. In some cases he is divine, in others a demigod, in still others a human being of exalted rank, and again he may be merely an ordinary man aided by spiritual helpers. Prose and poetry have developed along distinct paths. In prose there is connected narrative and considerable realism. Poetry embraces dirges, lyric songs, and eulogistic hymns. The latter are not built up as connected accounts of achievement but are ejaculatory panegyrics. The poems abound in symbolical allusions, antitheses, repetition, puns, riddles, and other stylistic devices.

F. Speiser, the explorer of the New Hebrides, has published a paper entitled "Kultur-Komplexe in den Neuen Hebriden, Neu-Caledonien u. den Sta.-Cruz Inseln" (*Archives suisses d'Anthropologie générale*, 1919, pp. 300-319). He discusses the data from the point of view of independent development versus borrowing and arrives at the conclusion that many traits have evolved spontaneously.

A result that, if verified, would revolutionize linguistic classification has been announced by A. Conrady (reported in *Anthropos*, XII-XIII, 702-708). Father Schmidt has connected the Malayo-Polynesian stock with certain languages of India and Farther India, merging them in a single "Austriac" family. Conrady extends the comparison to the Tibeto-Burman languages and arrives at the conclusion that the Austriac stock in turn is genetically related with all the languages of Farther India, with Chinese and Tibetan.

On the basis of a 12-years' residence in northern Luzon, C. R. Moas describes "Nabaloi Law

and Ritual and Kankanay Ceremonies" (*Univ. of Cal. Pub. in Amer. Arch. and Eth.*, vol. XV, nos. 3 and 4). The Nabaloi are the southernmost Igorot and, while sharing the general mode of life of their northern congeners, present interesting variations. There is a division into two castes on the basis of wealth, the rich lording it over the poor. Communal dormitories for boys and girls were once in vogue but are no longer so, and head-hunting likewise has become obsolete. The Nabaloi believe in a considerable number of spirits, whose cult is in the hands of the priests, those directing certain ceremonies being women. Most of the rituals are held for a curative purpose, the proper performance being first determined by divination. Sickness is conceived to result from the action of malevolent spirits or the craving of the souls of the dead for food and raiment. Two of the most important ceremonials which were formerly devoted to the celebration of a head-hunting raid and the cementing of peace, respectively, have assumed an altered significance, being now performed in order to cure or avert disease. Expensive ritual feasts are obligatory on the rich who wish to maintain their social status. Great importance is attached to the death ceremonies. In each case the spoken ritual consists of either a petition or a story that functions as a magical formula. The ceremonial scheme of the Kankanay confirms in its broad outlines to the Nabaloi pattern but exhibits greater local differentiation.

In two treatises on *Fêtes et chanson anciennes de la Chine* and *La polygamie sororale et le sororat dans la Chine féodale*, Marcel Granet develops facts and conceptions of general ethnological interest. He distinguishes as "sororate" the custom of marrying a deceased wife's sister, while the simultaneous marriage of several sisters is designated as sororal polygyny. In China about 25 centuries ago a nobleman was expected to marry wives belonging to a single family or bearing a single family name, but union with three sisters was tabooed. The orthodox allotment of wives comprised a woman, her younger sister, and her elder brother's daughter, all three being married by a single ceremony. The levirate was strictly forbidden, though connived at among commoners. A man and his elder brother's wife were not permitted to hold conversation. The feudal marriage law is supposed to have been superimposed on the simpler usages of the common folk, who were organized in local kin groups bearing a family name. Granet conceives these communes to have had connubial relations in pairs, each member of a pair exchanging its girls for those of the complementary group. The kinship nomenclature is suggestive in linking together father and paternal uncle, mother and maternal aunt, father's sister and mother-in-law, mother's brother and father-in-law, son-in-law and sister's son, respectively.

An important addition to ethnographic knowledge is offered in E. W. Smith's and A. M. Dale's two volume work on *The Ila-speaking People of Northern Rhodesia*. The Ba-ila, who correspond to other writers' Mashukulumbwe, live on the Kafue plains about 200 miles north of the Victoria Falls of the Zambesi. They are divided into a great number of matrilineal exogamous clans associated with totems which are not eaten by the group bearing the totem's name. Although the maternal uncle exercises some special

powers over his sister's children, a husband retains control of them in case of divorce since he has purchased his wife's issue with the bride-price. He has the usufruct of her body, but she holds property rights independently of him. Both the levirate and sororate are practiced and men also marry their cross-cousins but only the daughters of their paternal aunts. Besides the orthodox forms of permanent marriage there are also temporary exchange of wives and licensed cicisbeism. In addition to one's clan each individual also looks for assistance to his and her age-mates, i.e. those born or initiated in the same year. Fellow-members of an age-grade have the right of taking all sorts of privileges with one another, such as exercising ridicule or even hurling curses. Communities and lesser hamlets are governed by chiefs and headmen respectively, but chiefs are not absolute rulers, having definitely circumscribed prerogatives, such as allotting new land, admitting or excluding strangers, and exacting taxes for special purposes. Succession is not fixed, a council of elders selecting the fittest candidate from among the deceased chief's clansmen or sons. In judicial procedure oaths and ordeals figure prominently, the latter as either hot water or poison tests. The religious beliefs comprise faith in an impersonal power, in the transmigration of souls, in ghosts, divinities of varying rank, and a supreme deity named Leza who figures as the founder of many customs and is supplicated in times of drought and sickness. Below him are the communal gods, who are relied upon for success in war and protection against lions and pestilence. They are invoked jointly by all members of the community, while other spirits are associated exclusively with kin groups, husband and wife praying to distinct beings. Special spots are consecrated to the several gods but no effigies are made of them. On numerous occasions there are ceremonial offerings.

In a work on *Herkunft und Wanderung der Hamiten* the zoölogist L. Adametz attempts to solve the Hamitic problem through a study of the domesticated animals found among the Hamites. He argues that since the wild forms of the typically Hamitic sheep and goat, viz. *Ovis vignei cycloceros* and *Capra falconeri*, occur in Afghanistan, Beluchistan, and Northwestern India, this region must be regarded as the starting-point of Hamitic migrations. The long-horned ox of ancient Egypt is also regarded as a product of Hamitic domestication, having been bred from *Bos primigenius* on Egyptian soil.

A monumental three-volume work has been issued by F. Von Luschan on *Die Altertümer von Benin*. The author gives a detailed account of the Benin antiquities scattered over the world since the British punitive expedition. He stresses the essentially African character of the art products, but in corroboration of Frobenius' results assumes an ancient cultural connection between the western Sudanese and southern Europe. As regards the famous bronzes cast in the *cire perdue* manner of the Renaissance, Von Luschan points out that most of them contain very little tin.

In his "Etude ethnographique et anthropologique sur les Teda du Tibesti" (*L'Anthropologie*, XXX, pp. 115-135) P. Noel supplements Nachtigal's earlier notes on this Saharan people, especially with reference to social custom. Infant betrothal is found to hold sway and in case

of the boy's death before maturity he is superseded by a younger brother or paternal kinsman. Polygyny is common but the wives generally live in different localities visited by their husband, an arrangement consistent with the nomadic habits of the tribe. In the marriage ceremonial there is a pretense of capturing the bride, who is secluded for a period—four months, if a noblewoman—before she takes up the distinctively feminine labors of skin-dressing, matting and basketry. The avoidance rules are interesting. The son-in-law and his wife's kin avoid each other until the birth of a son, when they may exchange a few words. On the other hand, the wife speaks freely with her parents-in-law. The wife is not permitted to pronounce her husband's name and must not uncover her head before him.

EXPEDITIONS, MEETINGS, PERSONALIA. Toward the close of the year an ambitious scheme for the ethnological and archaeological exploration of Polynesia was launched through the generosity of Mr. Bayard Dominick and under the auspices of the Bishop Museum in Honolulu. The participants have been largely recruited from the United States. Drs. E. S. Handy and R. Linton have set out for the Marquesas Islands, E. W. Gifford and Wm. C. McKern to Tonga, and R. T. Aitken and J. F. G. Stokes to the Austral group. Not technically connected with this project but in consonance with its aims a somatological survey of Hawaiians has been undertaken by L. R. Sullivan, particular attention being directed to problems of miscegenation. A midsummer conference of scholars from different parts of the world was held in Honolulu to promote Polynesian research; American anthropology was represented by C. Wissler, A. M. Tozzer, and A. L. Kroeber.

In Canada field work has been resumed on almost ante-bellum scale, but in the United States it has hardly recovered that fortunate stage as yet. The Geological Survey of Canada has dispatched H. I. Smith to study the material culture of the West Coast tribes; C. M. Barbeau has resumed his intensive investigations of the Tsimshian; and there has been some archaeological work in the East by Wintemberg, as well as some ethnographic research in the Great Lakes region by Waugh. The United States National Museum sent Dr. W. Hough to work among the Hopi and Apache, while Dr. A. Hrdlicka of the same institution visited China, Japan, Korea, and Hawaii and N. M. Judd visited Chaco Cañon and Northwestern Arizona. Dr. J. W. Fewkes, chief of the Bureau of American Ethnology, resumed his archaeological labors in the Mesa Verde National Park; of his staff Dr. T. Michelson is continuing his investigation of Fox and other Algonkin tongues. N. C. Nelson of the American Museum of Natural History is engaged in archaeological work in the southwest. The Museum of the American Indian Heye Foundation has continued its support of local archaeological research under the direction of Messrs. M. R. Harrington, G. H. Pepper, and A. Skinner, and Prof. M. H. Saville has left to carry on Mexican investigations. Excavations of Seneca sites in Ontario county, N. Y., have been made by A. C. Parker, the archaeologist of the New York State Museum. Of European scholars, Dr. H. P. Steensby visited the lower St. Lawrence county in connection with historical studies bearing on early Norse exploration, and Dr. Karsten returned to Sweden after a several years' so-

jour among the Jibaro and Colorado of Ecuador. The British Mackie Expedition has been carrying on investigations in Uganda under the leadership of Rev. John Roscoe. Three months were devoted to the Bahima of Ankole, then a Bantu tribe inhabiting the mountains of Kigezi was visited, and finally the Bunyoro were studied.

The United States was visited by the two most eminent British representatives of the diffusionist point of view, Drs. W. H. R. Rivers and G. Elliot Smith, who lectured and exchanged opinions with their American colleagues. Anthropology has sustained the loss of Wm. Churchill, the well-known student of Polynesian linguistics and ethnography; of W. Radloff, Director of the Museum in Petrograd, the foremost investigator of the Siberian Turks; of Dr. S. A. Lafone Quevedo, the veteran Argentine ethnologist and linguist; and of the famous Italian anthropologist Rodolfo Livi, renowned for his *Antropometria militare*.

ANTIGUA. See LEEWARD ISLANDS.

ANTI-SALOON LEAGUE OF AMERICA.

Founded in 1895 by the coalition of the Anti-Saloon leagues of five States, this is a national federation of organizations whose object is the extermination of the beverage liquor traffic in the world. In 1920 it has 50 subsidiary State leagues and was working in coöperation with more than 40 other national temperance leagues. More than 1000 representatives conduct the work of the League. Despite the fact that the prohibition amendment to the Constitution had been passed, the League found a great deal of work necessary for its proper enforcement. The fight over the question of 2.75 beer was bitter, especially as the League had not obtained many favorable results in its efforts to prohibit this beverage. The League claims that the great harm in alcohol is the poisoning that it produces, and not the drunkenness, and that a small amount of alcohol each day leads to very serious and harmful consequences. The following survey was printed in the *Anti-Saloon Year Book*, showing what has happened to the erstwhile saloons and breweries: 500 breweries were manufacturing non-intoxicating cereal beverages; about 23 per cent of the breweries had been turned into ice factories and cold storage plants; others had been converted into oil refineries, canning factories, candy factories, vinegar plants, packing houses, creameries, beet-sugar factories, chemical factories, etc. The advent of prohibition had put out of business 236 distilleries, 1090 breweries, and 177,790 saloons. The League sent out a large number of questionnaires during the year as to the result of prohibition and as to how it is regarded by various interests. The results and a great deal of other information were published in the *Year Book* of the organization.

Reports from foreign countries showed in general that steps were being taken to curb the excessive drinking of intoxicating liquors. In Great Britain, however, there was a 60 per cent increase in 1919 of the amount of liquor consumed over the amount in 1918. The fact that a considerable number of European countries are dependent on wine as one of their principal products, makes it hard to introduce prohibition by any other than slow degrees.

The officers of the League for 1920 were Bishop Luther B. Wilson, president; Hon. S. E. Nicholson, secretary; Rev. P. A. Baker, general superintendent; Ernest H. Cherrington, general

manager of publishing interests. *The American Issue* is the official organ of the League, and there are 29 subsidiary and State organs. The publishing house and executive offices are in Westerville, Ohio, where three tons of literature are turned out daily. The legislative committee has its headquarters in the Bliss Building, Washington, D. C.

APHRODITE. See MUSIC, *Opera*.

AQUEDUCTS. The most notable projects of 1920 were those involved in the extensions of the water supply systems of New York and San Francisco. In the former city J. Waldo Smith, Chief Engineer, in his annual report stated that progress on the construction of the Shandaken tunnel of the Catskill water supply system for New York City had continued during 1919 and at the year's end all but one of the eight shafts had been completed and the tunnel heads turned. During the year 2356 linear feet of shaft were sunk and 1098 feet of tunnel were driven. A transmission line for the purpose of furnishing electrical energy to the various parts of the project had been constructed from a point near Kingston to the intake shaft at the Schoharie reservoir, a total distance of 50 miles.

During the year 1920 the contract for the Shandaken tunnel was assigned by the original contractors, the Degnon Contracting Company of New York City, to the Shandaken Tunnel Corporation, incorporated by the Ulen Contracting Corporation of New York, the Fidelity and Deposit Company of Maryland, and the National Surety Company, with a paid-in capital of \$750,000. This corporation was organized specially for completing the project which it took over towards the end of the year, with approximately \$2,000,000 worth of work completed. The seven construction and the one intake shafts had all been sunk and turned. The original contract was let to the Degnon Company Nov. 10, 1917, the contract price being approximately \$12,000,000.

SAN FRANCISCO—HETCH HETCHY PROJECT. This work advanced materially during the year 1920 both as regards the dam begun in 1919 (see YEAR BOOK for 1919, article DAMS) and the main tunnel to carry the water to San Francisco. At the site of the main Hetch Hetchy dam the Utah Construction Company had excavated both abutments from crest level down to water level, opened quarries, built tracks to bunkers, crushers, and screens and installed another incline, with a capacity of 40 tons, down to the floor of the valley. The entire foundation of the dam was expected to be exposed, and ready for concrete pouring early in 1921.

By the early summer of 1920 more than 3 miles of tunnel had been excavated on the Mountain Division of the Hetch Hetchy Aqueduct. The Construction Company of North America, which began operations on May 17th, had excavated almost half a mile of tunnel since taking over the city's forces. The validity of their contract was attacked in a taxpayers' suit which placed an injunction on the payment of \$276,776, the initial fee due the construction company, thus, as will be seen below, somewhat embarrassing the prosecution of the work.

Later in the summer the Construction Company of North America sublet the 18-mile contract to two well-known tunnel men. A. C. Dennis became responsible for 10 miles of the work on the west or Priest portal end and Rex C. Starr the 8 miles on the Early Intake end.

Mr. Dennis was in personal charge of construction on the 5-mile Rogers Pass tunnel for the Canadian Pacific Railway, where exceptional progress records were made. Mr. Starr had also gained a reputation for speedy work in tunnel driving. Later he assigned his contract. The following was the progress to the summer at each end of the tunnel headings where work was being carried on: Priest Portal, 6320 linear feet; Big Creek, west heading, 1400 linear feet; Big Creek, east heading, 1000 linear feet; South Fork, 4280 linear feet; Early Intake, 4000 linear feet.

However, work on the tunnels was shut down on August 26th by a strike of the tunnel workers, and, pending the outcome of the suit over the contract, was not resumed. This decision was rendered on Oct. 16, 1920, and new crews were then brought in and, beginning November 1st, the several headings were all being worked.

The Supreme Court of California decided that nothing in San Francisco's charter prevented the city from entering into a contract on a cost-plus fee basis such as that made with the Construction Company of North America for driving 18 miles of tunnel on the Hetch Hetchy project. The decision was of general interest as possibly applying elsewhere, where such contracts had been made. Accordingly in the *Engineering News-Record* a résumé of the features involved, supplied by M. M. O'Shaughnessy, city engineer of San Francisco, was printed as follows:

The contract embodies construction on the cost-plus plan, with the following modifications:

1. The contractor's fee is a flat sum fixed by competitive bidding and is payable in installments, including three annual advance payments which assist the contractor in financing his work.

2. While the contractor is required to secure and superintend the labor, and is given the right to "hire and fire" men, no change in wage scale can be made without concurrence of both the contractor and the board of public works. Materials and supplies furnished are purchased directly by the city after competitive bidding, in which the contractor himself may participate.

3. The contract contains a guarantee by the contractor as to maximum unit costs of work which were specified by him in his bid. If the actual costs exceed these bid costs, such excess is deducted from the unpaid balance of the contractor's fee. The method of determining the costs is set forth in detail in the specifications.

4. In order to insure the city's receiving the lowest possible bids both for contractor's fee and guaranteed unit costs, the board of public works was permitted to award the contract to the lowest bidder on either basis.

The contract has been in effect about six months, although payment of the contractor's fee had been withheld until the final determination of the suit. The system has worked very satisfactorily so far, and the City of San Francisco anticipated that the total cost will be less, by some \$2,000,000, than the lowest flat price bid received under alternative specifications at the same time.

SPRING VALLEY WATER SUPPLY. The City of San Francisco in addition to the Hetch Hetchy project was proposing in 1920 to acquire the properties of the Spring Valley Water Company, a private corporation which had supplied the city. The Railroad Commission of California began in March at the request of the city authori-

ties extended investigations of the properties of the company, and late in the year announced that it had placed on the same a valuation of \$37,000,000. The city authorities agreed to submit to the voters a proposition to acquire this valuable property by purchase, and the company on the other hand agreed to submit to its stockholders the proposition to sell at a price fixed by the commission. At the end of 1920 it was planned to hold in the following February a special city election to pass on the proposed purchase. A similar proposition to purchase the Spring Valley Water Company property in 1914 was defeated at a popular election, but the basic price then proposed figured in the 1920 negotiations with modifications in the way of depreciation and later additions. The 1920 valuation estimates also considered the cost to reproduce the plant and appurtenances not on prevailing costs but on average prices from 1914 to 1920.

With reference to the wisdom of the immediate purchase of the Spring Valley system by the city, the commission stated "There is no escape from the conclusion that the present supply of water for the city of San Francisco is dangerously near the point of insufficiency. Immediate steps to increase the supply should be taken. The water supply can be increased only in two ways: either by the city doing its own development in the immediate future or by creating conditions where the Spring Valley Water Co. can be put in a position to proceed with such development. In view of existing conditions it is not to be expected that the company is ready or able to raise the necessary new capital for construction and extensions and the city cannot afford to wait for an improvement of the urgent present water situation until the completion of the Hetch Hetchy system.

"With efficient operation and under reasonable water rates the purchase of the Spring Valley system will carry itself. It may be assumed that the Calaveras dam will be completed in the case of the purchase of the system by the city. The completion of the Calaveras reservoir will make available an additional supply of water sufficient to take care of the present urgent needs of the city. It is estimated that this addition will be sufficient to meet the demands of the city until the completion of the Hetch Hetchy system and supply the needs of a population in excess of 700,000."

WELLINGTON, NEW ZEALAND, PROPOSED AQUEDUCT. The city council of Wellington, the capital of New Zealand, during 1920 decided to expend about \$500,000 in cutting two tunnels through the hills near the city to bring water from the Orongorongo River, with the additional expenditure of \$1,119,295 for extra mains and other expenses to provide a water supply sufficient for a city of 130,000 people. The population of Wellington and its suburbs in 1920 was about 95,000. See WATER SUPPLY.

ARABIA. The large peninsula in southwestern Asia lying to the south of Syria, Mesopotamia, and the Persian Gulf, with an area estimated at 1,200,000 square miles, or excluding the Syrian desert and the Sinaitic peninsula, about 1,000,000 square miles, and a population variously estimated, the highest figure being about 7,500,000. There are great tracts of desert occupied only by Bedouin tribes which are nomadic in their habits, and in these regions a traveler may preceed many days without meeting

a person. The difficulty of determining the population even approximately cannot be overcome and according to some estimates there are only 4,000,000 people in the country. The northern sand belt and the great southern desert are uninhabitable. The people are found mainly on the northern edge of the northern sand belt, and in the hinterland of Yemen, the interior of Oman, and the highlands of Asir. In Central Arabia there are many oases, however, and these as well as the fertile districts on the coasts support settled communities. The country in 1919 was divided among the following political organizations, which, however, were not of a determinate character: The kingdom of Hejaz or Hedjaz with uncertain frontiers, but with a population of about 750,000. Historically and from the point of view of religion it is the most important part, as it contains the holy places and the sacred cities of Mecca (80,000) and Medina (40,000). It was formerly included in the Turkish Empire, constituting the vilayet of Hejaz. There is a railway terminating at Medina. Its chief port and capital is Jidda on the Red Sea (population 20,000). By the treaty with Turkey the independence of Hejaz was recognized.

The emirate of Nejd and Hassa is the greater of the two principalities in the central part of the country and the seat of the Saud dynasty whose great extension of power in recent years is noted below, under *History*. It sprang from the old Wahabite Empire founded in 1745. The capital is Riyadh.

The emirate of Jebel Shëmmar or Shammar, lying to the north of Nejd, was formerly under its control but broke away and maintained its independence under the Rashid family until the great war. Recently a reconciliation between this dynasty and that of Saud was reported, which again brought it under the Saud influence. Its capital is the Bedouin city, Hail, and the emir in 1920 was Adullah Ibn Mitah who succeeded at the assassination of his father in May of that year.

The principality of Asir is on the western coast between Hejaz and Yemen and its capital is Sabiyah in the south. In part of the region, especially in the highland country, the tribes are virtually independent.

Finally the imamate of Yemen is centred about Sanaa under a dynasty which traces its descent to the daughter of Fatima. Here there is a large cultivatable area and a considerable agricultural production. In 1920, the imam was Yahya Mohammed Hamid-ed-Din. Population of Yemen, about 1,000,000. Its capital is Sanaa, with a population of about 25,000, and its chief ports are Mocha and Hodeida. For mention of the other divisions which are found within the limits of Arabia, see the articles, ADEN, OMAN, and KOWEIT.

HISTORY. In preceding YEAR BOOKS an account has been given of the rise and history of the kingdom of Hejaz, which was founded during the war (1916) when Hussein, Sherif of Mecca, freed himself from Turkish power and was crowned king of the Hejaz. The new kingdom was supported by British arms and stood before the world as the chief power in Arabia. Almost all the discussion in the press during the war and afterward had to do with Hejaz and little was said about the remainder of the country. The kingdom of Hejaz, however, was not the

most important element in the Arabian world and its predominance in political discussions was probably due to the British interest and to the fact that most of the information came from British sources. The new state was a more or less artificial creation of the British, in that it could not have survived without British aid and a considerable British subsidy. Before the war the Turks ruled over the Hejaz, including the sacred cities of Mecca and Medina. They ruled also over Yemen, which comprised all Southern Arabia and is the largest of the Arab divisions, and they exercised a nominal authority in the provinces of Haasa and Kateef on the east coast. In Southern Arabia the power fell into the hands of one of the typical Arab conquerors before the war, Bin Saud, whose ruthless and able character secured him the throne and gave him power over a wider area of Arabia than any other chief. About this time—that is, to shortly before the commencement of the great war—a brotherhood of Mohammedan religious reformers, the Ichwan, animated by a fanatical spirit, began to extend its influence. This grew with great rapidity until by the end of the war they became the real power in the country. They accepted as their religious and political head, Bin Saud, whose power thenceforth depended on their support. Before the war the British had been in possession of the Persian Gulf, which was policed. They made treaties with various Arab tribes and pursued a policy which successfully checked the advance of Turkey and the extension of German influence in the surrounding regions. There was strong anti-British feeling in parts of Arabia during the first part of the war, especially owing to Persian influence. Bin Saud, however, took the side of the British and his prestige was so great that even during the disasters of the first Mesopotamian campaign there was no hostile movement against the British in Arabia. Bin Saud strengthened his power by pacific means, including reconciliation with Bin Rashid, the representative of the dynasty mentioned above whose rivalry with his own had disturbed the country for the greater part of a century, and forming an alliance with the tribes of the Shemmar region. British money, as noted above, financed the revolt of Hussein, Sherif of Mecca, and brought the Hejaz kingdom into existence. The Turks thus lost all of Arabia, and there was thenceforth no danger from either Turks or German influence in the peninsula. Thus in Arabia itself there were two principal chiefs, Hussein, King of the Hejaz, and Bin Saud. The former according to the reports of travelers was not a man of great strength or extended influence, but on the contrary was lightly esteemed by the Arabs. The latter on the other hand, who was ruling nearly the whole of the country, was described as a remarkably vigorous ruler whose prestige was high, but whose power as already said depended upon the support of the Ichwan. The King of the Hejaz at first was inclined to despise the untrained troops of these fanatics but when they won over some of the inhabitants of his country and difficulties arose resulting in a battle, the forces of the reformers easily routed the Sherif's army, though the latter was far better equipped. The leaders of the fanatics threatened to attack the King and declared that without any doubt they could overcome him. By certain observers their forces were believed to be invincible so far as any merely Arab enemy

was concerned; but Bin Saud insisted upon keeping the peace.

The situation after the war was briefly as follows: The British were supporting the King of the Hejaz and it was believed that in certain British quarters there was hope that he might be made caliph of the Mohammedan world upon the downfall of the Sultan. It was even said that a revolt on his part against the Sultan might not be objectionable to the British and that if it succeeded he would be generally recognized as his successor in the caliphate. On the other hand it was said that he was generally without influence in Arabia and in certain parts of the Moslem world was detested, as for example in India, where for some time the feeling had prevailed that it was a disgrace even to make pilgrimages to Mecca. Moreover, the general dislike of Mohammedans by the British naturally turned them against any protégé of the British authorities. This dislike was not founded upon reasonable criticism, but upon the pride of Mohammedans and their objection to being ruled by a people of alien race and faith. The position of the King of the Hejaz in 1920 was not believed to be secure. He had made the Ichwan his bitter enemies, and they would undoubtedly have already overthrown him, but for Bin Saud's intervention. The latter was also receiving a subsidy from the British government. It was a question whether he could maintain his prestige, which was said to depend on lavish expenditures of money in gifts.

In the autumn a special envoy was sent to Paris by the King of the Hejaz and at the same time it was planned to send special missions to the capitals of the other states of the Entente for the purpose of removing misunderstandings and strengthening the ties of friendship between the King and his allies. According to the representatives in Paris, the Hejaz government wished in every way the aid of the work of France in the East. According to the envoy King Hussein was earnestly seeking the friendship of France; his son, the Emir Faisal, had been sent on a mission by the King on a single occasion during the Peace Conference, but since then the Emir had acted only on his own account and the King was not responsible for acts committed by bands of nomads, who did not acknowledge his authority. For an account of Faisal's activities in Asia Minor and his relations with the French, see article, SYRIA. See also WAR OF THE NATIONS.

ARBITRATION, INTERNATIONAL. See INTERNATIONAL PEACE AND ARBITRATION.

ARBITRATION AND CONCILIATION. See LABOR ARBITRATION.

ARCHÆOLOGY. Although several years have passed since the closing of the war archaeological exploration has not been thoroughly organized as yet. There are however several important pieces of work to be recorded in the various lands around the Mediterranean. The purpose of this work was to bring to light any important burials which might have been concealed by the drift. More interesting, from the popular point of view at least, was the arrangement in the Museum of the remarkable models discovered in the untouched tomb of Mehenkewtre. These most completely illustrate the service demanded by the mode of life of the princely classes in ancient Egypt. The work of Petrie at Illahun concerned itself chiefly with clearing out the twelfth dynasty pyramid and

its surroundings. In the rubbish heap of the pyramid the excavators found the gold serpent which had been wrenched from the crown of Senusert II. The workmanship is fine, showing an inlay of colored stones and a head of lapis lazuli with eyes of garnet. In the tomb of a queen was found an unusual alabaster jar, 22 inches in height, bearing a magic inscription which states that all which is produced from the earth will be obtained from it. In the search of the contemporaneous cemetery the mastaba of the chief architect of Egypt, the builder of the pyramid at Illahûn, was found. Like those of the sixth dynasty it stood upon a hill with a chapel cut in the side of the hill. The front is colonnaded like the twelfth dynasty tombs of Beni Hasan. The most unexpected discovery was the small, untouched cemetery of the prehistoric period, dating from the fourth dynasty. In it were a hundred burials which show every stage from the plain open grave to the shaft tomb. Thirty different types were noted. The most important work of the Metropolitan Museum, noted above, was in the hill behind Shiekh 'Abd el-Kurneh (to the south of Deir el-Bahari). Here was found the eleventh dynasty tomb of the monarch Mehenkwtetre, a small chamber containing a complete set of funerary models all beautifully preserved. These show gardens with pools, fruit trees and covered walks, granaries, slaughter houses, carpenter shops, breweries, bakeries, boats, etc., in fact in these models we have illustrated the elaborate service demanded by the life of a prince of that day. The tomb was discovered during the work of clearing away the drift that had accumulated in the bays of the cliffs of Deir el-Bahari. In the Valley of the Tombs of the Kings, at Thebes, to the south of the entrance to the tomb of Menephtah, Lord Carnarvon and Mr. Carter found some alabaster jars of large size and of a new style. Most of them bore the cartouche of Menephtah while some belonged to the time of Rameses II.

At Carchemish in Northern Syria C. L. Wooley, acting for the British Museum, resumed the excavations begun in 1914, but interrupted by the war. Excavations were undertaken on the site of the double ring of the city walls. On the land side all the gates, the fortifications of the acropolis, as well as the great river wall which still holds back the Euphrates River were cleared out. The work has demonstrated that there are four periods of construction, and the results should throw light on the 100 sculptured slabs, etc., that were found before the war. In addition the excavators turned up new sculptures and inscriptions. A grave of the royal period was also discovered. At Ascalon, under the direction of Garstang, the Palestine Exploration Fund began its excavations on September 9th. Preparatory diggings brought to light two architectural statues and an imposing Victory standing on the earth. These had already been known in Turkish times. During this excavation was turned up a white marble statue of a kneeling girl of one quality. The search for the Temple of Fortune has been begun and extensive preparations have been made for the exploration of the Philistine mound.

At Mycenæ, in Greece, Wace, acting for the British School in Athens, has carried on a thorough examination of the circle of graves just within the Lion Gate. The investigation has shown that Mycenæ was already inhabited at

the end of the Neolithic age and was a flourishing city in the years reaching from 2000 to 1500 B.C. To the end of this period belong the graves within the circle. The latest of these graves date in the late Helladic period. Excavations on the acropolis have shown that the palace was of a much more extensive plan than is usually supposed. Evidence for at least two stories was discovered. It was also found that much later, after Cnossus had fallen, the city was fortified with a wall which was carefully carried around the circle of graves. At that time the enclosure was filled in, leveled, and surrounded by the double wall of slabs now seen there, and new gravestones placed in position to replace the earlier ones. Between this circle and the Lion gate a large building, probably a granary, was brought to light. In it were found a number of vases which fall stylistically between the Mycenaean and Geometric wares and thus fill in a gap in Greek pottery. The excavators also explored the well-known Treasury of Atreus, finding under the threshold of the main chamber a small deposit of gold leaf, beads, and ivories, together with a fragment of late Mycenaean ware. The tomb therefore may be dated in the period from 1400-1200 B.C. This is the traditional date for the dynasty of Atreus and goes to show that there is an element of truth in Greek legend.

At Cyrene, in Africa, work has been carried on. Inscriptions have been found which show that the temple thought to be that of Apollo was in fact dedicated to the emperor Hadrian. In the agora was found a circular building which served as a meeting place for the priestesses of Hera.

In Italy excavations have been conducted at Veii, Vetulonia, and Castellina in the Chianti Valley, near Florence. These have brought to light remarkable examples of Etruscan architecture, sculpture, and bronze work, e.g. bronze helmets from Vetulonia, a dancing faun from the same site, and a fine life-sized sixth-century Apollo in painted terra cotta from Veii.

ARCHITECTURE. As in 1919, any attempt to chronicle the architectural activity of 1920 finds itself inseparably bound up with considerations of building, as regards both labor and materials, and, in New York especially, as regards certain legislation respecting building.

Many buildings have been carried through to completion in spite of adverse conditions and high wages and high costs of material, but even more, especially in residential work, have been deferred or suspended until more favorable building conditions prevail.

Unsettled building conditions, as a matter of fact, have endured for a longer time after the Armistice than was generally anticipated, and it is only at the present writing in January, 1921, that a return to conditions in any sense normal can be recorded.

Manufacturers of building materials are reported as being rather cautious about 1921, in view of the general tendency of dealers to unload costly stocks in anticipation of probable price reductions. The willingness of distributors of building materials to take losses on stocks in hand reflects their aim to encourage a more general resumption of building activity early in 1921.

Building materials showing a decline in price as of January, 1921, include asphaltum, certain

kinds of face brick, window and plate glass, sheet-iron and plaster-board. In lumber, price reductions are also seen in ash, basswood, plain and quartered oak, North Carolina pine, studing, rafters, ceiling and partition lumber and all hardwood flooring, including yellow pine. The condition suggests a general house-cleaning on the part of dealers, in anticipation of lower manufacturing prices, and the manufacturer, realizing that decrease in material prices will stimulate building, is faced with the problem of developing his production resources in such a way as neither to overstock nor to be caught later in the year with production and supply inadequate to meet a great demand.

The diverting of materials and labor to construction work connected with the war naturally created certain conditions which are still with us as a post-war legacy—notably the housing problem. The high cost of war-time and post-war building at once involved the element of finance, and various legislative proposals of a remedial nature were made with a view to relieving the shortage of apartment houses and dwellings—especially acute in and around New York City. Many of the measures suggested were unfair to property owners, and when the banks were consulted there was found to be a great reluctance to finance building projects on account of the low return on the investment.

The State Legislature rejected a group of proposals presented by Governor Smith, and the reaction at Albany appeared to take the form of a statement that housing should be regarded as a Municipal concern, and not a State concern. Among numerous proposals in this group was that of New York City Municipal Loans for building purposes, and with it went the constructive proposal to constitute building loans and mortgages as exempt from taxation.

A committee on housing was appointed (the Lockwood Committee) and in its initial investigations of the entire question, it undertook to look into certain alleged combines for price maintenance among the building industries. As the investigation progressed, an astoundingly scandalous condition came to light. The work of the committee commenced in Oct. 20, 1920, and Samuel Untermeyer, the attorney, at the opening of the third session said:

"Now, what we intend to show is a banding together among the material men, first, in separate associations in each of 32 lines engaged in building materials, from the manufacturer down to the retailer; and then the banding together of the different associations under the head of the Building Materials Employers' Association; and then we propose to show that not only has labor been dragnetted into the Building Trades Council in many instances, but that employers have been dragnetted and forced into certain of these associations by the relation that exists between the Building Trades Council and the Building Trades Employers' Association."

In the course of testimony from a long list of witnesses, evidence came to light which disclosed a far-reaching and intricate condition of corruption, bribery, and coercion—a condition plainly making against the progress and normal expansion of building. Many indictments are called for, and at the present writing the hearings of the committee are still continuing and the final outcome of the investigations cannot be recorded.

On May 5, 1920, the annual convention of the American Institute of Architects was held in Washington, D. C. These conventions are of marked importance in that the reports of their several committees represent inquiries and investigations of nation-wide scope and significance, and the subjects assigned to the different committees are designed to be of great constructive aid to the entire architectural profession.

At this 53rd convention reports were received on (1) Education, with recommendation to extend the usual four-year course for students; (2) structural service; (3) small houses, a new committee being appointed to study the whole subject and problem of financing small houses; (4) competitions; (5) schedule of charges, considering the question of raising the architects' fee from 6 per cent to 8 per cent, referred back to the State Chapters for study during 1921; (6) jurisdictional disputes; (7) community planning.

Another interesting report was reviewed—the report of the American Institute's Post-War Committee, which was appointed to inquire into and report on conditions and problems of architectural practice as found to exist after the war. The accomplishment of this committee is of distinct interest, and so germane to the purpose of this review that the following notes are given at length from the *Journal of the American Institute of Architects*:

a. The committee received and tabulated under separate headings a mass of opinion, suggestion, and criticism from individuals and societies bearing on various phases of the problems confronting the architectural profession.

b. Establishment of a point of contact and machinery for coöperation between organized labor, building and engineers.

c. Establishment of a definite basis for co-operation between organized labor, building contractors, and engineers which, it is hoped, will be an opening wedge to more sympathetic understanding between these great elements in the building industry.

d. Laid foundations for closer association with the building industry through participation in the Conference of the National Federation of Construction Industries.

e. Placed an argument for Registration of Architects, with practical data for Registration Laws in the hands of organizations and individuals in nearly every state in the union.

f. Placed the question of the organization of State societies, together with an outline of the experiences of states having such societies, and also a form of Constitution and By-Laws in practically every State in the Union, through the membership of the Post-War Committee.

g. Started a larger body of architects thinking concurrently along formulated lines of study than ever before.

h. Developed a form of organization that has many features to recommend it as a workable machine for carrying on educational effort of national scope.

i. It has developed, through the effort of the special Post-War Committee of the Washington State Chapter a chart indicating desirable fields for investigation in the study of problems affecting the proposition of architecture.

j. It has laid the basis for an international professional relationship, by correspondence and interchange of documents and information.

The Post-War Committee further outlined several important subjects for future study and action—subjects of great importance to every practicing architect. These additional subjects are given as follows:

1. What should be the function of the American Institute of Architects?
 - a. A national organization of the profession. and a direct factor in economic and social life, or
 - b. A dignified academy, attainable only by a few, and dealing only with the internal ethics of the profession.
2. What should be understood by the term "Architect"?
3. Desirability of giving Local Chapters (of the American Institute of Architects) more authority in formulating Rules of Practice for the guidance of their members.
4. Creating sentiment in favor of State Registration Laws.
5. Parliaments of Building Institutes.
6. Relationship between Architects and Draftsmen.
7. Methods of organization of an architect's office.
8. Value of dignified publicity.
9. Remuneration for the architect's services.
10. Expense of estimating.
11. Schedule of charges.

As an instance of the activities of some of the State Chapters of the American Institute of Architects, "The Architects' Service Bureau of Minnesota, Inc.," should be of interest throughout the country. The members of this chapter, observing the offers of free plan service by lumber-yards, "plan factories" and other enterprises, conceived the idea of a coöperative effort to provide accurate, carefully thought-out plans for houses of 3, 4, 5 and 6 rooms. The work of this Minnesota experiment proved to be of such a constructive nature that it served as a basis for the plans subsequently developed by the Small House Committee of the American Institute of Architects.

Of actual architectural works, as was implied before, there are relatively few important examples to cite for 1920. Many buildings projected in 1919 have gone forward in their construction through 1920 and will be completed in 1921. Of these one of the most notable is the Cunard Building, in New York City (Benjamin W. Norris, architect). In Detroit work progresses on the Durant Building (Albert Kahn, architect), the largest office building ever erected. Its cost is estimated at \$8,000,000. The same architect also has the First National Bank of Detroit (Michigan), a \$4,000,000 building, and others totalling \$23,000,000.

The most important completion of the year was that for the Nebraska State Capitol, for which the winning design was made by Bertram G. Goodhue, of New York City.

There has been a more marked building activity in the Middle West than elsewhere in the United States, and the greater part of this has been in the industrial and commercial field. A number of hotels have been built, and a great many theatres (of the large motion picture type), while many public buildings have been held up due to limited appropriations which failed to cover the great increases in building costs.

While this country has passed no such wise resolution as France in the matter of war memo-

rials, forbidding construction until 10 years after the war, many have been designed, but not built. Building costs, again, are the reason. The plans for the great Victory Hall for New York City are among the war memorial works which are at present being held in abeyance.

It is reported that Whitney Warren, the prominent New York architect, has been invited to supervise the rebuilding of the civic buildings of Louvain, in Belgium. Reconstruction work in general progresses steadily in France, although it is obvious that many more years will elapse before the extensive damage of the destruction in the North of France will be fully achieved.

Great Britain is experiencing difficulties in solving post-war housing problems similar to our own—the high cost of building and the difficulty of getting building loans except at exorbitant rates of interest. Theorists are devising solutions which are based on re-distribution of population, but meanwhile the great industrial centres are suffering from increasing congestion.

It is generally believed by the architects of this country that building will begin to resume something of its pre-war trend in 1921, for while 1920 has been by no means barren of architectural activity, conditions have been far from normal. Under conditions which obtained during the war, and conditions which resulted from the war, it is by no means surprising that the progress of architecture both here and in Europe has been greatly retarded. See articles on HOUSING, CITY PLANNING, etc.

ARCTIC REGIONS. See POLAR RESEARCH; SPITZBERGEN.

ARGENTINA. A republic on the eastern coast of the southern part of South America. Capital, Buenos Aires.

POPULATION. There are fourteen provinces, ten territories, and one federal district, with a total area estimated at 1,153,119 square miles. The population according to the census of 1914 was 7,885,237. It was estimated January 1, 1919, at 8,411,000. No later figures for the population by provinces and other divisions were available than those given in the preceding YEAR BOOK, which were for January 1, 1918, as follows:

Buenos Aires	1,615,223
<i>Provinces</i>	
Buenos Aires (La Plata)	2,190,876
Santa Fé	947,804
Córdoba	766,875
Entre Ríos (Paraná)	444,991
Corrientes	357,026
San Luis	124,387
Santiago del Estero	285,681
Tucumán	354,545
Mendoza	298,225
San Juan	127,775
La Rioja	83,146
Catamarca	106,500
Salta	147,537
Jujuy	77,990
<i>Territories</i>	
Misiones (Posadas)	57,544
Formosa	20,399
Chaco (Resistencia)	48,599
Pampa Central (Central Acha)	111,887
Neuquén (Chos Malal)	30,474
Río Negro (Viedma)	44,963
Chubut (Rawson)	25,838
Santa Cruz (Gallegos)	10,882
Tierra del Fuego (Ushuaia)	2,527
Los Andes (San Antonio de Los Cobres) ...	2,572
Total	8,284,266

THE GENERAL MOTORS BUILDING, DETROIT
Said to be the Largest Office Building in the World

The capital and largest city is Buenos Aires, with a population estimated September 1, 1918, at 1,637,155; the second city is Rosario, with a population estimated in 1918 at 235,000; other large cities with recent estimates of population are: Cordoba, 156,000; La Plata, 119,000; Avallaneda, 105,000; Tucuman, 100,000; Santa Fé, 60,000; Mendoza, 62,000; and Bahia Blanca, 75,000.

EDUCATION. Elementary education is free and subsidized by the general and provincial governments. It is secular and compulsory between the ages of six and fourteen. At the close of 1919 the schools numbered 9268 with an enrollment of 1,190,231 pupils and 36,615 teachers. Secondary education is controlled by the general government which maintained 37 national colleges with 11,022 pupils and 1244 teachers; 37 special institutions with 11,261 students and 897 teachers. Besides these, there are 59 military schools, 82 normal schools, and 79 schools annexed to normal schools; the universities of Buenos Aires, La Plata, and Cordoba, whose students numbered respectively, 10,404, 2835, and 5506; and the two provincial universities of Santa Fé and Tucuman. A popular university was in process of organization in 1920 with departments of philosophy, law, history, science, letters, medicine; foreign languages, etc. The budget for education in 1919 totaled 57,626,228 paper dollars.

In 1920 it was planned to establish at Rosario the National University of the Littoral, with complete courses in technical instruction covering a study period of five years, three of which were to be devoted to general scientific studies and two to the study of special subjects. The aim of the university was to be the preparation of experts in mechanical, electrical, construction, and civil-engineering work. It was to take the place of the industrial school which was formerly in operation in Rosario.

PRODUCTION. Agriculture and stock-raising are the main sources of wealth, the area for agricultural and pastoral use being placed at over 400,000,000 acres, which, however, was only conjectural. There are still large tracts of lands that have not yet been disposed of in the territories, estimated at an acreage of nearly 238,000,000 and suitable for pastoral uses. These are sold or in certain instances are given free of charge to colonists. It has been estimated that about 10,000,000 acres of the cultivable portion required irrigation. The following table shows the acreage of the leading crops for 1918-19 and 1919-20.

	Acreage	
	1918-19	1919-20
Wheat	17,175,000	15,132,500
Oats	3,015,000	1,327,500
Flax	3,456,625	3,563,000

The following table gives the official statistics of cultivation, production, and exports of wheat, maize, linseed, and oats for three agricultural years:

Products	Area Acres	Production Met. tons	Exports Met. tons
Wheat:			
1916-17	16,088,967	2,180,400	897,622
1917-18	17,581,477	6,086,445	2,029,419
1918-19	16,976,068	5,015,000	3,258,259
Maize:			
1916-17	8,968,851	1,494,600	896,115
1917-18	8,715,377	4,335,000	647,657
1918-19			2,374,721

Products	Area Acres	Production Met. tons	Exports Met. tons
Linseed:			
1916-17	3,207,411	102,406	140,168
1917-18	3,233,600	497,578	391,053
1918-19	3,419,059	705,000	840,272
Oats:			
1916-17	2,525,406	487,850	270,761
1917-18	2,854,055	1,100,000	583,536
1918-19	2,980,075	840,400	331,350

The above figures of exports each cover the 12 calendar months of 1917, 1918, and 1919, respectively. See AGRICULTURE.

As no coal is mined in Argentina the country is dependent upon the United States and England, but its scarcity will be seen from the fact that only 707,712 tons were imported in 1917, and 821,974 tons in 1918, as against 4,046,278 tons in 1913. The railway, industrial, and domestic necessities of the country suffered severely during the war, not only from the scarcity and the abnormal prices of coal itself, but also from the resulting speculation in quebracho and algarroba firewood, in the charcoal (the poor man's fuel) derived from these woods, and in Argentine petroleum as fuel oil. Coal rose from \$31 per ton at the beginning of 1917 to \$50 at the middle of 1918, wholesale. The woods used for firewood and charcoal are quebracho and algarroba; it requires about 2½ tons of quebracho to produce the calorific value of 1 ton of coal.

Petroleum is the most important of the mining products of Argentina. During the war, wolfram was in considerable demand and at high prices, while mica was also sought by one or two concerns throughout the Republic. Copper has been produced in a desultory way for limited periods in the past. The provincial governments of Argentina possess the control of mines in the respective provinces as a result of the provisions of the national constitution, while those in the national territories are under the direct control of the national government. Mining concessions, however, are regulated in all cases by the mining code of the republic.

COMMERCE. Exports and imports for 1918 in gold pesos were, respectively, 801,466,488, and 500,602,752. The following table shows the total Argentine foreign trade, the sum of the imports and exports, by countries, for the years 1913, 1917, and 1918, values being expressed in gold pesos:

Countries	1913 Pesos	1917 Pesos	1918 Pesos
Australia	1,204,292	33	32,953
Aus.-Hungary.	10,469,727	9,796	1,292

Total	1,015,383,105	930,491,227	1,302,069,240

FINANCE. The unit of currency is the peso or dollar (gold) with a value of 96.475 cents. But though the country theoretically is on a gold basis, the money in circulation is chiefly paper pesos or dollars, which have a value under the conversion law of 1899 of 44 per cent of the gold peso or 42.449 cents in American currency. The chief items of the budget for 1920 were as follows:

Revenue	Dollars Paper
Imports	97,000,000
Internal taxes	80,000,000
Income tax	38,000,000
Patents	6,000,000
Stamps	25,000,000
Total (including all revenue)	428,244,700
Expenditure	Dollars Paper
Congress	4,790,260
Ministry of:	
Interior	54,728,068
Foreign Affairs and Worship	4,295,534
Finance	16,325,164
Public Debt	124,006,484
Justice and Education	75,861,814
Army	35,792,572
Navy	31,163,026
Agriculture	10,255,880
Public Works	13,698,875
Pensions, etc.	17,414,244
Public works	25,619,900
Subsidies	11,825,304
Grand total	428,134,973

The external debt January 1, 1919, was 671,336,118 paper pesos and the internal debt 642,791,606 paper pesos.

In the budget for 1921, the estimated expenditures were 482,654,460 pesos, currency. The principal items in pesos were as follows: National Congress, 5,274,260; foreign relations and worship, 4,941,074; treasury, 18,246,600; public debt, 124,306,484; public instruction, 88,327,493; war, 44,141,337; marine, 36,405,117; agriculture, 10,515,860; public works, 14,364,835; pensions, retirements, etc., 17,641,284; public improvements, 45,814,284, and subsidies and charity, 13,195,168.

COMMUNICATIONS. During 1920 measures were taken to extend certain of the Argentine railway systems. The government of the Province of Corrientes granted a concession to an American syndicate, known as the "Ferrocarril Colonista Corrientino," to construct a railway line in that province and to exploit it for 50 years. The government reserved the right of expropriating the permanent way, rolling stock, and other assets of the concern at any time upon payment of the real value plus a premium of 20 per cent. Furthermore the stations were to be located at places selected by the government and in order to prevent land speculation the ground adjoining the stations was to be subdivided and offered for sale at prices determined in advance. An important extension put under way during the year was that of the Pacific Railway of Argentina from Stroeder to Carmen de

Patagones, a distance of 40 miles. It was planned to construct a further extension to connect this line and the Southern Railway with the government lines in the vicinity. The railways open to traffic on January 1, 1919, had a mileage at 22,578 of which 3816 (18 per cent) belonged to the state. At that time capital invested in Argentina railways was placed at 1,254,795,500 gold dollars. In 1918 the vessels entered at all Argentina ports numbered 45,072 with a tonnage of 17,483,482, and those cleared, 44,845, with a tonnage of 17,334,850. At the beginning of 1918, the post offices numbered 3461 and the telegraph lines in 1915 had a total mileage of 43,153, of which 23,978 were national lines. No later figures for post offices and telegraphs were available than those given in the preceding YEAR BOOK.

ARMY AND NAVY. Service is compulsory in the national militia on all citizens between the ages of twenty and forty-five. The country is divided into five military districts, each of which must provide a complete division of the first line and also a reserve division. The active strength of each division is fixed at about 20,000 men and the reserve strength at about 300,000. One-half are of the first line and one-half of the special reserve. Measures have been taken to organize a territorial reserve. The navy included two large dreadnoughts laid down in 1917, *Moraneo* and *Rivadavia* of 27,940 tons each; two pre-dreadnoughts of 2336 tons each; and four armored cruisers and one light cruiser, besides various destroyers, torpedo boats and miscellaneous craft. The personnel varied from 5000 to 6000 men. See NAVAL PROGRESS.

GOVERNMENT. The form of government is republican and the executive power is vested in a president, elected for six years by electors chosen by the fourteen provinces. He is ineligible for reelection. The President is commander in chief of the army and navy and appoints to the higher offices in the respective departments. The government has a responsible ministry or cabinet consisting of eight members, namely, secretaries of state, for the interior, foreign affairs, finance, war, justice and public instruction, agriculture, marine, and public works. Legislative authority is vested in the national congress, which consists of two houses, the Senate and the House of Deputies. The Senate has thirty members, elected by the legislatures of the provinces and by a special body of electors in the capital. The deputies number 120 and are elected by the people, in a proportion, according to the constitution, of one for every three inhabitants. One-third of the Senate is renewed every three years, and one-half of the House every two years. The President in 1920 was Señor Hipolito Irigoyen, who assumed office, October 12, 1916, and the Vice-President was Dr. Bento Villanueva.

HISTORY. A sharply contested electoral contest ended March 7th in the triumph of the Radicals over the combination of opposing groups. The Radical party, to which President Irigoyen belonged, elected 102 members, the Conservatives 46, and the Socialists 10. Various disturbances accompanied the campaign including strikes and anarchist demonstrations. In the city of Buenos Aires, the headquarters of some twenty anarchist groups were closed and 200 arrests were made. Argentina was represented in the Geneva meeting of the League of the Nations by her foreign minister, Señor Pueyrredon. At a meeting of

leading importers at Buenos Aires, October 20, it was voted that imports from the United States should be limited to absolute necessities until the rate of exchange improved. Soon after the meeting the rate stood at 133. Labor troubles were reported at several points and a number of persons were killed in conflicts between strikers and the police. In the autumn there was a shortage of bread and some of the mills closed for lack of grain. On November 15th a number of shops were closed in the state of Cordoba on account of the heavy taxes. The treaty with the United States on the subject of commercial travelers was signed October 22nd. Similar treaties had been signed with several of the South American states. A bill was introduced in the Chamber of Deputies in the autumn providing for compulsory farming, that is to say, the conscription of the young men not called into naval or military service in order that they might form an agricultural army. Toward the close of the year a "graft" investigation found that the capitol building in Buenos Aires had been constructed at an undue expense, the sum of 5,500,000 pesos having been unnecessarily expended. Measures were taken toward the solution of the immigration problem. For three years the number of emigrants had exceeded that of immigrants and plans were under consideration for the attraction of immigration to the country. At the close of the year Austria was taking steps to promote the emigration to Argentina of her working classes, by means of opening credits for intending emigrants. A serious earthquake on December 17th destroyed several towns on the slope of the Andes causing a great loss of life and property. The early reports indicated that hundreds had been killed and pronounced the shock the most serious since that of 1869.

At the close of the year plans were under consideration for the owning and operation of a steamship line by the government, which raised the general question whether the state ought to compete with private capital in commercial undertakings. Opponents argued that both for political and economic reasons the government ought not to enter commerce, and declared that the merchant marine had served the country efficiently during the war. On the other hand, it was argued that the government was now paying hundreds of millions to the merchant marine of other countries and that vessels bringing freight to Argentine ports could find no adequate return cargoes. Government ownership in the present situation would obviate these difficulties.

ARIZONA. POPULATION. According to the preliminary report of the census of 1920, there were 333,903 residents in the State, Jan. 1, 1920, as compared with 204,354 in 1910.

AGRICULTURE. According to the census of 1920, the number of farms was 10,816, an increase of 17.2 per cent since 1910. The following table is compiled from the estimates of the United States Department of Agriculture, covering the years 1919 and 1920:

Crop	Year	Acreage	Prod., bu.	Value
Corn	1920	28,000	644,000	\$1,095,000
	1919	30,000	900,000	1,800,000
Oats	1920	13,000	481,000	462,000
	1919	13,000	494,000	494,000
Wheat	1920	36,000	864,000	2,264,000
	1919	38,000	950,000	2,138,000
Barley	1920	20,000	680,000	952,000
	1919	25,000	875,000	1,225,000

Crop	Year	Acreage	Prod., bu.	Value
Hay	1920	137,000	*392,000	11,170,000
	1919	177,000	*657,000	13,021,000
Beans	1920	15,000	75,000	308,000
	1919	20,000	120,000	540,000
Potatoes	1920	5,000	450,000	855,000
	1919	5,000	350,000	682,000
Sweet potatoes	1920	1,000	150,000	345,000
	1919	1,000	150,000	375,000
Cotton	1920	237,000	*110,000	16,500,000
	1919	107,000	*60,000	15,261,000

* Tons. * Bales.

MINERAL PRODUCTION. The following table shows the production of base and precious metals for 1920 and 1919, according to the estimates of the United States Geological Survey:

Gold, Dollars	Silver, Ounces	Copper, Pounds	Lead, Pounds	Zinc, Pounds
1920—				
4,943,000	6,093,251	559,235,000	14,000,000	1,457,000
1919—				
4,506,413	5,266,605	535,100,844	10,203,078	1,717,000

The value of the above metals in 1920 was about \$107,725,000, a decrease of nearly \$3,433,000. The quantity of all these metals except zinc increased, but the total output for 1919 had been far below the average for the previous five years. In spite of the increase in the quantity of most of the metals and in the total value of the gold, silver, and lead, the combined value of all the metals was less on account of the low price of copper. During the last two months of the year, when the price of copper fell below 15 cents a pound, many of the large copper companies again curtailed production. The increase in the value of the gold output was a result of the slight improvement in the production of gold from copper ore and the steady output from the Oatman region. More than half the output of gold from Arizona came from gold ores in the San Francisco district, in Mohave County. The mine output of silver increased in value from \$5,898,598 to about \$6,032,000. The value of the output of copper decreased from \$100,086,757 in 1919 to about \$95,741,000 in 1920, owing to the decrease in the average price of copper from 18.6 cents to about 17.12 cents a pound. Most of the large smelting plants produced more copper than in 1919, but no effort was made to reach the totals of 1918, for the demand for the metal was not so great as had been expected. Toward the end of the year the price of copper decreased so much that many of the large mining companies operated at a loss. The mine production of lead in Arizona increased in value from \$540,763 to about \$1,147,000. The output of recoverable zinc decreased from 1,717,000 pounds in 1919 to about 1,457,000 pounds in 1920. The value of the output of recoverable zinc decreased from \$125,341 to about \$118,000.

TRANSPORTATION. All corporate activities in Arizona are under the scrutiny and partial direction of the Arizona Corporation Commission, an elective body of three members. Thus are included railroads, automobile lines, and mining and other incorporations, though taxation is under charge of the State Tax Commission. The railroads of Arizona have a mileage of 2429. Two main lines cross the State. The extensions and branches mainly are dependent upon the mining industry. These in 1920 were limited to a 72-mile lumbering road in northeast Arizona

and to a 6-mile agricultural spur near Phoenix. The 26-mile narrow-gauge line to Jerome was abandoned, transportation being otherwise supplied, and service was cut on a number of lines on account of the decline in the copper-producing industry.

FINANCE. The total receipts of the fiscal year 1920 were \$8,747,419.02, of which \$5,641,440.77 was from direct taxation. On hand at the end of the fiscal year, \$1,974,654.53. The State's indebtedness was \$869,972.43. The counties had outstanding bonds amounting to \$1,967,804.87. The cities' indebtedness, limited to Prescott, Tombstone, and Tucson, amounted to \$130,497.99. The gross indebtedness of the State, including the cities, was \$2,968,275.29, with a credit of \$423,951.70 in funds.

EDUCATION. The school population numbered 85,213; pupils enrolled, 70,288; school districts, 473; teachers, 1955. The high schools numbered 30, with an enrollment of 5597, and with 156 teachers. The two normal schools had 884 students. Average cost per capita of enrollment: Common schools, \$71; high schools, \$181. Salaries of teachers in the common schools: Average male, \$164.86; female, \$118.77. Gross expenditure for common schools during the fiscal year, \$4,836,599.43, distributed as follows: High schools, \$789,754.47; vocational training, \$99,255.20; normal and high school military training, \$6,401.69.

LEGISLATION. A special legislative session of one day was held, February 12, called for and devoted only to approval of the national woman suffrage constitutional amendment.

ELECTIONS. The vote for President was as follows: Harding, 37,016; Cox, 29,546; as compared with the following in 1916: Wilson, 33,170; Hughes, 20,524; Benson (Socialist), 3174; Hanly (Prohibitionist), 1153. In the elections for governor, the votes were: Campbell (Republican), 37,249; and Simms (Democrat), 31,682.

CHARITIES AND CORRECTIONS. Penitentiary, Florence; Expenditures, \$165,741.95; number of inmates, 324. Industrial School, Fort Grant: Maintenance, \$47,995.06; Improvements, \$77,691.92; number of inmates, 107. Pioneers' Home, Prescott: Expenditures, \$35,250.84; number of inmates, 65. State Hospital for the Insane, Phoenix: Expenditures, \$195,834.34; number of inmates, 553.

OFFICERS. Governor, Thomas E. Campbell; Secretary of State, Ernest Hall; Auditor, Charles W. Fairfield; Treasurer, Raymond Earhart; Attorney-General, W. J. Galbraith.

JUDICIARY. Supreme Court: H. D. Ross; A. C. Baker; A. G. McAllister.

ARIZONA, UNIVERSITY OF. A co-educational State institution at Tucson, Ariz.; founded in 1885. The enrollment for the summer session of 1920 was 78; for the regular session, 1088 (676 men and 412 women), making a total in all courses of 1616 (eliminating duplicates). The faculty numbered 117 of whom 20 had been added in the course of the year. The income was \$836,415.85. The library contained 32,600 volumes. Recent additions to the plant were, besides the women's dormitory and the steward's observatory, mentioned in the preceding YEAR BOOK, the Home Economics Practice House and the Green House for agricultural experiment stations. The university comprises a college of letters, arts, and sciences; a college of mines and engineering; and a college of agriculture; it also

maintains a correspondence course. President, Rufus Bernhard von Kleinsmid, Ph.D.

ARKANSAS, POPULATION. According to the preliminary report of the census of 1920, there were 1,752,204 residents in the State Jan. 1, 1920, as compared with 1,574,449 in 1910.

AGRICULTURE. According to the census of 1920, the number of farms was 232,602, an increase of 8.3 per cent since 1910. The following table is compiled from the estimates of the United States Department of Agriculture, covering the years 1919 and 1920:

Crop	Year	Acreage	Prod., bu.	Value
Corn	1920	2,360,000	55,224,000	\$53,567,000
	1919	2,407,000	43,326,000	71,055,000
Oats	1920	352,000	8,800,000	6,864,000
	1919	320,000	7,040,000	6,195,000
Wheat	1920	126,000	1,197,000	2,274,000
	1919	280,000	2,680,000	5,373,000
Rye	1920	4,000	40,000	88,000
	1919	4,000	38,000	76,000
Tobacco	1920	800	*480,000	149,000
	1919	800	*456,000	160,000
Hay	1920	852,000	^b 1,178,000	18,804,000
	1919	782,000	^b 1,086,000	22,189,000
Peanuts	1920	16,000	416,000	973,000
	1919	19,000	665,000	1,556,000

* Pounds. ^b Tons. ^c Bales. ^d Gallons.

TRANSPORTATION. In 1920 the total mileage of the railways of the State was 5144. By act of the General Assembly in 1919 the Arkansas Corporation Commission was created, to enter upon its duties Jan. 1, 1921. It was to consist of three members appointed by the Governor, to hold office for two, four, and six years respectively, and its jurisdiction extended over common carriers, telegraph and telephone companies, gas and electric light companies, and all other public service corporations.

EDUCATION. The school population in 1920 was 676,169; enrollment 483,172; daily attendance 326,053. The teachers numbered 10,947 and the general average of salary was \$72 a month: White male teachers received \$90 per month; white female, \$70; colored male, \$61; and colored female, \$52.

FINANCE. According to the report of the Treasurer for the year ending June 30, 1920, the total receipts were \$6,124,636, and the disbursements amounted to \$6,215,015, leaving a balance in the treasury of \$111,482. The total debt at the close of 1920 was as follows: State school bonds, \$1,134,500; university endowment bonds, \$141,666.67; State notes held by outside persons, \$750,000; current indebtedness of State penitentiary, \$342,000; farm note indebtedness of State penitentiary, \$158,832.

CHARITIES AND CORRECTIONS. Charitable and correction institutions of the State are as follows: Hospital for Nervous Diseases, at Little Rock (population, 1873); Deaf Mute Institute, located at Little Rock (pupils, 330); Blind School, at Little Rock (pupils, 116); Confederate Home, at Sweet Home (population, 156);

Tuberculosis Sanatorium, at Booneville (patients, 176); Farm for Women, at Jacksonville (inmates, 13; opened for inmates, June 20, 1920); Boys' Industrial School, at Pine Bluff (population, 121); Girls' Industrial School, at Alexander (inmates, 20; opened for inmates, March 24, 1919); State Penitentiary, at Little Rock, Ark., and with farms at Tucker and Cummins (prisoners, 728).

ELECTIONS. The vote for President was as follows: Cox, 105,618; Harding, 69,874. The vote for Senator was: Caraway (Democrat), 126,477; Cole (Republican), 65,381. The vote for Governor was: McRae (Democrat), 123,604; Townsend (Republican), 46,339; Busler (Socialist), 4543; Blount (Negro), 15,627. The vote on constitutional amendments gave a majority for the initiative referendum, equal suffrage, and increase of the Supreme Court; but it was insufficient to carry the amendments, as the majority of the total vote cast at the election for Governor was required.

OFFICERS. Governor, Thomas C. McRae; Secretary of State, Ira C. Hopper; Attorney-General, J. S. Utley; Treasurer, Joe Ferguson; Auditor, James Guy Tucker; Adjutant-General, Joe S. Harris; Superintendent of Public Instruction, J. L. Bond.

JUDICIARY. Supreme Court: Chief Justice, E. A. McCulloch; assistant justices, Carroll D. Wood; J. C. Hart; Frank G. Smith, T. H. Humphreys.

ARKANSAS, UNIVERSITY OF. A co-educational land grant State institution, at Fayetteville, Ark.; founded in 1871. There are colleges of arts and sciences, education, engineering, agriculture (including an experiment station), and medicine. The last-named is situated at Little Rock. The enrollment for the summer session was 556 and for the fall session, 1015. The faculty numbered 85. The income for the year was \$315,766.15. There were 32,300 volumes in the library. President, John Clinton Futrell.

ARMAGH, JOHN BAPTIST CROZIER. Archbishop of British prelate, died April 12th. He was born April 8, 1853, and educated at Trinity College, Dublin, where he took honors. In 1887 he was made Canon of Down Cathedral and in 1896 Canon of St. Patrick's National Cathedral. From 1893 to 1897 he was chaplain to the Lord-Lieutenant of Ireland. He became a bishop in 1897 and was appointed Archbishop of Armagh in 1911.

ARMENIA. Before the war the term Armenia was indeterminate, being sometimes applied to the territory occupied by the Armenians within the former Turkish Empire and sometimes to the whole country in which the Armenians were the dominant race element, and which was partly in Russian territory. The Armenians of the Turkish Empire made up the minority in the five vilayets of Erzerum, Tiflis, Kharpout, Diarbekr, and Sivas and were slightly in the majority in the vilayet of Van. It was estimated that they formed about 38.9 per cent of the population of these regions. Their present number is unknown owing to the massacres, deportations, and emigrations. As to the Armenians in Russia, they are now mainly included in the Armenian republic and were estimated in 1917 at 1,293,000. For the varying accounts of the massacres and deportations and the varying estimates of the losses thereby, see preceding YEAR BOOKS.

THE ARMENIAN REPUBLIC OF ERIVAN, proclaimed in May, 1919. The events immediately preceding the establishment of the present Armenian Republic may be briefly summarized: In Trans-Caucasia in the former Russian Empire the three main peoples were the Armenians, the Georgians, and the Tartars. On April 22, 1918, the Diet of Trans-Caucasia declared its independence of Russia, under the title of the Federal Republic of Trans-Caucasia, comprising Georgia, Armenia, and Azerbaijan. It had refused to recognize the Bolsheviks from the first and had formed a provincial government at Tiflis in February, 1918. This new federal republic soon split up into its three national parts, Georgia and Armenia declaring their independence. In May, 1918, the Armenian Republic was constituted in the territory comprising the southeastern frontiers of the Trans-Caucasian division of the Russian Empire, and in January, 1920, its independence was recognized by the Allies. The constitution was to be formed by a constituent assembly which was not only to make the fundamental law for this region but also for Turkish Armenia as soon as its limits could be determined. Thus the Armenian Republic in the year 1920 was a fragment of the former Russian government and was awaiting consolidation with the Armenians of the former Turkish Empire whose limits had not been fixed and were subject of discussion throughout the year (see WAR OF THE NATIONS). Its area was placed at 26,130 square miles. Various boundaries for Turkish Armenia were proposed, some of which would bring the total area of the state after adding the Turkish portion to about 80,000 square miles and others would bring the total area as high as 170,000 square miles. The population of the Armenian Republic was placed in 1917 at 2,159,000, of whom 1,416,000 were Christians. Most of the others were Mohammedans. After 1917, there was a great shifting of this population, owing chiefly to the departure of a portion of the Mohammedan element and the return of about 300,000 Armenians. The chief cities in the Republic are Erivan (90,000) and Alexandropol (50,000). Measures for nationalization were taken after the separation from Russia, and Armenian became the official language and the language of the schools. Compulsory military education was introduced. See AGRICULTURE.

The mining industry of the Armenian Republic was represented by 22 copper-ore, rock-salt, and iron-pyrite enterprises, 18 of which exploited old mine workings. Seven copper smelters comprised the metallurgical industry of the country. The average annual production during the years 1911, 1912, and 1913 was as follows: 13 mines produced 154,900 metric tons of copper ore; 4 mines 10,000 tons of iron pyrites; 5 mines 25,400 tons of rock salt; and 7 smelters 6614 tons of copper metal. The first railway dates only from the year 1900, and the total length of the system in 1920 was not more than 370 miles. Seventeen mines and three smelters—that is to say, 71 per cent—of these enterprises were without railway or even of metalead-road communications. The region's output of rock salt and iron pyrites represented 100 per cent of the production of the whole of Transcaucasia and its production of copper 69 per cent. Before the war the copper output of the region represented 20 per cent of Russia's total production. Official

information collected by the mines administration concerning the total mineral resources of the country showed that the mines, wells, etc., in the region numbered 450. Of this total 60 mines contained lead and silver, 10 gold, 210 copper, 11 zinc, 3 molybdenum, 1 antimony, 6 cobalt, 16 manganese, 58 iron, 1 chromium, 8 arsenic, 23 iron pyrites, 9 sulphur, 8 graphite, 47 coal and lignite, 1 jet, 4 combustible schist, 9 peat, 1 ozocerit, 32 rock salt, 1 carbonate of soda, 1 Glauber salt, 3 borax, and 15 alum. There were also 6 oil wells and 6 salt springs.

The sources of revenue were state monopolies and indirect taxation. During the first five months of 1919, the revenue and expenditures balanced at 1,950,000 francs (ordinary budget) and the extraordinary expenditure was 4,650,000 francs. The army in 1919 was placed at a strength of 18,000 but in time of war it was said that this could be doubled.

The executive was in the hands of a cabinet of ministers (there being no president) as follows: Prime minister and minister of foreign affairs; and ministers of interior; public works; post and telegraphs; war; finance; commerce and industry; public education; and supplies and public charity. There was a chamber of eighty deputies (elected June, 1919, by universal suffrage) who also discharged certain executive functions. The prime minister in 1920 was M. Alexander Khatissian.

HISTORY.

ARMENIA AND THE TURKS. According to the leader of the Turkish Nationalist forces, Mustapha Kemal Pasha, the Armenians had maltreated the Mohammedans and the same complaint was made against the Government of Georgia. Accordingly on June 4th it was decided to send delegates to Moscow to protest against these acts. At the same time the Turkish forces were ordered to take the offensive against Armenia, in order to capture certain mountain passes, which controlled territory that had been guaranteed to Turkey by the treaties of Batum and Brest-Litovsk. At this time, however, confidential dispatches were received from the Soviet government saying that the frontiers of Persia, Armenia, and Turkey could be determined peacefully by the mediation of the Russian Soviet government, and therefore, that the Turks should not take the offensive. The Turks decided to proceed to the occupation of certain districts, including that of Kars, and ordered the eastern army to undertake the offensive as soon as possible. The campaign was interrupted by the arrival of a Russian agent through whom the Soviet government appealed for help in carrying out their own plans. The Soviet government then sent two divisions of the Russian army to the Caucasian front. These entered Azerbaijan where they were cordially welcomed and whence they began operations against Armenia and Georgia. Meanwhile the Bolsheviks were being defeated on the Polish front. Withdrawal of their troops from the east followed in order to reinforce the army engaged with Poland and a revolt was organized against the Bolsheviks in the East. Upon the withdrawal of the Soviet troops, the Armenians began operations and succeeded in capturing the coal fields of Olti. In August, the Armenians advanced to Julfa on the Persian frontier and the Turkish

forces retired to the south of the Arax River. Turkish attacks, however, were renewed in the autumn in conjunction with the Bolshevik forces, and before the close of the year the Turks had captured Erivan.

ARMENIA AND THE BOLSHEVISTS. In spite of a peace settlement that had been signed at Tiflis, August 10, the Soviet forces along with Tartar marauders were, according to the Armenians, ravaging the Armenian frontier provinces, and about September 15th, the Armenian government sent protests on the subject to the government at Moscow. It was said that fifty Armenian villages had been ravaged. The Bolsheviks renewed their attacks in October. Meanwhile, they had entered into the alliance with the Turkish Nationalists noted above. The Soviet government demanded of the Armenian Republic free transit for Soviet troops across its territory, and the use of its railways. The Armenian government at first rejected these demands. But the combined Turkish and Bolshevik movement continued with increasing force and the Armenian government was obliged to sign in November an armistice providing for the withdrawal of troops from the west bank of the Arpa River and for the occupation of Alexandropol by the Turks. Great distress was reported among the inhabitants, who had gathered in large numbers in the barren highlands where they were threatened with starvation. It was said on November 11, that 100,000 refugees were roaming about without shelter, food, or clothing, that the cities were overcrowded with them, that in short, the country was facing absolute destitution. After the occupation, the Armenian Republic was proclaimed as a Soviet state. Meanwhile, there were signs of jealousy between the Soviet government and the Turkish Nationalists, and on November 25, the Moscow government warned the Turks against advancing further into Armenia. Both parties made appeals to the Armenian population, the Turks saying that they would grant favorable terms and the Soviet government giving assurance of protection from attack. Meanwhile, the Powers represented at the League of Nations were struggling with the question of the Armenian mandate.

ARMENIA AND THE POWERS. In the Geneva Assembly, Lord Robert Cecil appeared to express the general sentiment of that body when he said that the League of Nations would not represent the public morality of the world if it was unable to do anything toward saving the Armenian people. A resolution offered by the French delegate, M. Viviani, after an eloquent address was carried, calling upon the Council to arrange with some Power for the taking of measures that would stop the hostilities between the Armenians and the followers of Kemal. On November 25, the Council transmitted this resolution to the governments of all the members of the League and made a special request for mediation on the part of the Government of the United States. On November 30, President Wilson replied that he would mediate through a representative. Meanwhile, according to the press, the Armenians were suffering at the hands of the Kurds and the Turkish Nationalists as much as ever. Moreover, the Bolsheviks were said to be gaining the upper hand in the Armenian Republic. It was evident that the Soviet propaganda among the Armenians was successful. On November 11,

the Armenian ministry which had taken part in the Treaty of Sevres had been replaced by an extremist government, which had come to an understanding with the Soviet government with a view to concluding a new armistice with the Turks. On the same date, Tchitcherin sent a message to Krassin, the Soviet delegate at London, announcing that the Russian Soviet had proposed to mediate between Turkey and Armenia. On November 19th, the Bolshevik commissary, M. Le Grand—and another delegate—set out for Evrian, and while they were on their way, a new armistice was concluded by the Turks and Armenians and the hostilities came to an end. The terms proposed by the Turks as published by the newspapers were ostensibly not aimed at the destruction of Armenia. The Turks on the contrary, desired to maintain Armenian independence in order that the country might serve as a buffer state between Turkey and Russia. The Turks demanded first of all that Armenia should renounce the Treaty of Sevres and that the frontier between Turkish and Armenian territory should be fixed by the two peoples concerned. Turkey desired that Armenia should abstain henceforth from making common cause with the Powers hostile to Turkey. The Turks demanded certain guarantees for the safety of the Moslems living in Armenian territory. This was the situation early in December when it was learned that President Wilson had chosen for his representative in the mediation, Mr. Morgenthau, former American ambassador to Turkey.

Interest centred at the close of the year in the question of boundaries. It had not been definitely settled at the close of the year, but it was understood that the limits proposed by the President included less of Turkish territory than those previously proposed by the Allied prime ministers. The boundary according to the first reports was to run along the Black Sea at a point a little to the west of Tireboli through Mitikan, west of Mush, south to Lake Van to the frontier of Azerbaijan. The President's award did not include the vilayets of Diarbekr, Sivas, Harput, and Adana. The line was not determined for the eastern frontier adjoining Georgia and Azerbaijan, which was to be left for the Allies to determine by separate negotiations. Owing to the operations of the Bolsheviks and the Turkish Nationalists, conditions were confused at the close of the year, and in view of the action of Greece and the probable necessity of revising the treaty of Sevres, the question of the boundaries of Armenia seemed likely to be re-opened in spite of the President's mediation. The Turkish Nationalists, who from the first had held control of Turkish Armenia, had overrun the Republic of Armenia and before the end of the year captured its chief cities, including the capital, Erivan. But the Russian Soviet government had obliged the Armenian Republic to submit to it. In fact Armenia was reported to be a virtual dependency of the Soviet government, which had already secured control over Azerbaijan, and was planning to do so over the Republic of Georgia. See WAR OF THE NATIONS.

ARMENIAN. See PHILOLOGY.

ARNOLD, LYNN JOHN. Lawyer and editor, died at Albany, N. Y., May 27. He was born at Burlington Flats, N. Y., September 28, 1864, and admitted to the New York bar in 1889. After a brief period of practice he was made

surrogate of Otsego County in 1895. He was a prominent member of various commercial and legal associations and was president of the *Knick-erbocker Press* at Albany.

ASPHALT. A preliminary estimate of the production and sales of asphalt and native bitumens and allied substances in the United States in 1919, issued by the United States Geological Survey, shows that asphalt produced from domestic petroleum amounted to 600,000 short tons, valued at \$9,000,000, an apparent increase over 1918 of 72,425 tons and of \$1,564,796, respectively. The asphalt produced from Mexican petroleum amounted to 672,000 short tons, valued at \$7,917,000, an increase from 1918 of 21,756 tons in quantity and a decrease of \$2,407,020 in value. About 115,000 short tons of native bitumens and allied substances valued at \$1,000,000 was produced in 1919, an apparent increase over 1918 of 54,966 tons and of \$219,192.

ASTRONOMY. The progress of astronomical research tends to centre about the work of the Mount Wilson Observatory, and here during the year 1920 were perfected instrumental methods of making celestial measurements far beyond the power of any apparatus hitherto available. The success of Michelson's interferometer attached to the 100-inch Hooker telescope, at Mount Wilson, was probably the most conspicuous event of the year. Other salient advances include the widespread use of radiotelegraphy in interchanging time-signals between observatories, for determining longitudes and for other purposes; increased knowledge of temporary stars and their meaning; and steady progress toward a sound knowledge of the structure of the stellar universe. There were no eclipses of special interest during the year; comets were uncommonly scarce; solar activity was not notable except for one brief outbreak; and the constant discussion of outstanding questions concerning the Einstein theory of relativity did not lead to any final results.

MOUNT WILSON OBSERVATORY. "The 100-inch Hooker telescope," says Director Hale in his annual report, "yielding results that are of service in all departments of the observatory's work, has remained a centre of interest throughout the year. In light-gathering power, in the photographic registration of minute details of structure, and in the separation and measurement, by Michelson's interference method, of double stars previously unresolved, this instrument has responded admirably to a wide variety of tests. Altogether the most significant of the auxiliaries thus developed is Michelson's interferometer, which promises to play an important part in the future of sidereal astronomy. Its possibilities in this field were clearly foreseen and fully described by Michelson in 1890, and one of them was successfully tested by him in his measurement of the satellites of Jupiter in the following year. The fact that no astronomical applications of the method have since been made is not easily explained. Astronomers acquainted

with the extreme sensitiveness of the interferometer, and constantly hampered by atmospheric disturbances, have naturally feared that differences in optical paths would obliterate the fringes. But it turns out that they can be clearly observed with large apertures, even when the seeing is poor.

"A crucial test was made September 18, 1919, when Professor Michelson, at the first trial on Altair, had no difficulty in seeing the fringes with the full aperture of the 60-inch and 100-inch telescopes. The essence of the method lies in the use of two slits, symmetrically placed on either side of the axis of the telescope, and so mounted in a rotating support that their distances apart can be varied. As the mirror is otherwise covered, the only light entering into the focal image is that which passes through the slits. Observed with a high-power eyepiece (2000 to 10,000 diameters), the fringes appear as sharp, narrow lines on a fluctuating background. In a case like that of the close double star Capella, the components of which, about 0."05 apart, are not visible in any telescope, there are two independent sets of fringes, one due to each star. On rotating the disk carrying the slits, the visibility of the fringes is seen to vary with the position angle. When the line joining the slits corresponds with the line joining the stars, the slits are separated until the fringes of one set fall exactly between those of the other, causing minimum visibility, or complete disappearance if the two stars are of equal brightness. The distance between the slits then permits the angular distance between the stars to be computed with a precision greatly superior to that attained by the micrometric measurement of wide binaries. As an indication of this precision, it may be mentioned that the greatest difference between the observed and calculated positions of the components of Capella is four-thousandths of a second of arc."

The apparatus above described has since been improved by using two adjustable plane mirrors instead of slits, in combination with the 100-inch telescope, a large interferometer being attached to the upper end of the telescope tube. The enormous resolving power thus attained, corresponding to that theoretically pertaining to a telescope of about 40 feet aperture (i.e., five times as great an aperture as that of the largest telescope in the world), made possible the remarkable feat which, announced at the Chicago meeting of the American Association for the Advancement of Science, Dec. 29, 1920, attracted immense interest throughout the world. This was the measurement of the angular diameter of a star. The method was applied to the star Betelgeuse (Alpha Orionis). As the distance of this star is known from parallax measurements, its actual diameter is easily computed from the angular diameter measured with the interferometer, and turns out to be enormous; viz., about 260,000,000 miles. Thus its volume is about 37,000,000 times as great as that of the sun, and if placed at the centre of the solar system it would extend nearly to Mars.

Michelson's method appears to be applicable not only to measuring close binaries and stellar diameters, but also to securing more accurate results than have hitherto been attainable in the measurement of wider double stars, determinations of parallax and proper motion, the measurement of the displacement of a star caused by the

gravitational field of Jupiter (Einstein effect), and probably other refined measurements. In short, it seems to open up a new chapter in the history of astronomy.

In addition to his applications of the interferometer, Michelson has been carrying out at Mount Wilson a new determination of the velocity of light, which promises to yield results of the highest accuracy.

The great light-gathering power of the Hooker telescope, used in the ordinary way, is indicated by Professor Hale's statement that it "should add several hundreds of million stars to those already known." One use to which it is to be applied is in the measurement of the radiation of faint stars and the determination of the spectral-energy curves of brighter ones. It is proposed to have Dr. C. G. Abbot make such measurements with the bolometer. At present measurements of stellar radiation are being made with a new device known as a "thalofide cell," in which the sensitive substance, fused on a quartz disk and mounted in an evacuated tube, is composed of thallium, oxygen and sulphur.

The continuation of Dr. Shapley's investigations of star-clusters has added further arguments in support of his view that the galactic system is much larger than was formerly supposed from consideration based on brighter stars. The use of an intensifying lens with the Hooker telescope has enabled him to photograph much fainter objects than could be reached formerly. He has also continued his studies of globular and open clusters, analyzed the characteristics of 1152 giant stars in 9 clusters, and determined the total intrinsic luminosities of 40 globular clusters, which he finds, on the average, to give 275,000 times as much light as the sun. Dr. Shapley's investigation of the faint globular cluster M 72 has revealed the presence of many variables, 26 of which have been studied, giving the light-curves and periods characteristic of Cepheids or the cluster type, and indicating that the distance of this very remote cluster is 83,000 light-years.

DISTRIBUTION OF THE STARS IN SPACE. The Dutch astronomers Kapetyn and Van Rhijn published a paper of exceptional interest which was put into popular language and otherwise elucidated by Prof. H. N. Russell in the *Scientific American* for October 30th. The following extract is from Russell: "Within a hundred light-years of our sun, the stars appear to be scattered with fair uniformity in space. The number which lie within this distance, according to Kapetyn's new calculation, is 6200. The great majority of stars in any given region of space are fainter than the sun, and really bright stars are rare. For example, out of the 6200 stars nearer than 100 light-years, 790, or only one-eighth of the whole number, may be expected to exceed the sun in brightness. About 100 of these will be ten times as bright as the sun, or more; and only five or six will exceed 100 times the sun's brightness. Only one star in 50,000, on the average, is 1000 times as bright as the sun. Stars fainter than the sun constitute the majority of the whole—5410 out of the 6200 stars aforesaid. About 3400 of these will give out less than one-tenth as much light as the sun, leaving some 2000 in the intermediate region of brightness; and of the 3400, 2200 will be found to possess a luminosity between 10 per cent and 1 per cent of the sun's. Among the remaining

1200 still fainter stars, only a dozen will be less than a ten-thousandth of the sun's brightness."

The Swedish astronomer C. V. L. Charlier, in an address delivered in Copenhagen in December, 1920, referred to some extremely important studies of the Galaxy being made at the Lund Observatory. He states that this work will demonstrate that the sun is situated at one end of the Galaxy instead of in the centre, as has been heretofore supposed, and that the Galaxy is an ellipse the major axis of which is directed toward the constellation Sagittarius.

TEMPORARY STARS. The study of temporary stars, or novæ, continues to occupy a very prominent place in astronomical research. The majority of these objects are faint and are discovered by photography, but it is notable that a bright naked-eye nova appeared in 1920, only about two years after the sensational appearance of the brilliant nova in Aquila. It was discovered by Denning, the well-known British student of meteors, on August 20, and is known as Nova Cygni No. 3. Of magnitude 3.5 at the time of discovery, it rose to a maximum brightness of 1.8 on August 24th, and then declined, remaining visible to the naked eye for less than a month. On photographic plates its history has been traced back only to August 16, 1920, when it was of magnitude 7. It is still visible in telescopes of moderate power, and the same is true of three other novæ; viz., Nova Aquilæ No. 3, Nova Lyræ, and Nova Ophiuchi No. 4.

Many hypotheses have been advanced from time to time to account for the visual and spectroscopic phenomena characteristic of temporary stars. According to Adams, the star is surrounded by a shell of incandescent gases, ejected at the time of the outbreak, and expanding in all directions. This hypothesis, based upon the shift of the spectrum lines, appears to have been strikingly confirmed in the case of Nova Aquilæ, of 1918, by the actual appearance in large telescopes of a small circular nebula in place of the star, which has steadily increased in angular diameter. In June, 1920, the diameter of this object, as measured at the Lick Observatory, was 3".8.

EINSTEIN THEORY. In accordance with Einstein's theory of relativity there should be a certain systematic displacement toward longer wave-lengths of the spectral lines radiated near the edge of the sun. According to a paper by L. Grebe and A. Bachem in *Zeitschrift für Physik*, vol. I, pp. 51-54, 1920, the authors claim to have found a shift agreeing satisfactorily with the theory for certain lines in the ultra-violet. There are, however, a great many possible sources of error in such measurements, and few astronomers admit that this problem has been solved. Efforts by J. Evershed and C. E. St. John to verify the Einstein displacement of solar lines are described in the *Observatory* for April, and the net result is merely to emphasize the great complexity of the problem. St. John and Babcock were still at work on this question at Mount Wilson.

THE SUN was comparatively quiescent during most of the year, but a group of spots that crossed the central solar meridian on March 21st was the largest since the great group of August, 1917. The passage of this group was attended, especially on March 22nd-23rd, by splendid auroral displays and great magnetic storms. Dur-

ing the summer of 1920 Ellerman, at Mount Wilson, took a large number of photographs of solar spectra for the purpose of studying the general magnetic field of the sun. These supplement the plates secured in 1916, which, according to measurements by Mr. van Maanen, confirm within narrow limits the period of 31.52 days found for the rotation of the sun's magnetic axis in 1914.

The Astrophysical Observatory of the Smithsonian Institution has established a new station for solar constant measurements in the Harqua Hala Mountains of Arizona, to replace the station on Mount Wilson. The station of the same institution hitherto maintained at Calama, Chile, has been removed to a much higher location, with better atmospheric conditions, 10 miles south of Calama. In his annual report for 1920, Director Abbot says: "From correspondence with Dr. Guthnick, of the Berlin-Babelsberg Observatory, a most interesting confirmation of the solar variability has appeared. Variations of brightness of the planet Saturn from January to May, 1920, were shown by Dr. Guthnick's photo-electric observations which could not be accounted for after allowance for all known sources of variability. These outstanding variations were found to be in almost exact correlation with fluctuations of the solar radiation as observed at Calama, Chile. One per cent increase in solar radiation was found to accompany 1 per cent increase in Saturn's brightness. These results, however, were only derived in connection with one of two possible interpretations of the nature of solar variation. The sun might vary in such a manner that its changes would be observed simultaneously in all directions and so would occur on identical days on all the planets. This hypothesis *does not fit* the available observations of the sun and Saturn. On the other hand, the solar radiation may be unequal in different directions. Such inequalities are, in fact, indicated by the ragged raylike structure of the solar corona. On this hypothesis a change of solar radiation would occur as ray after ray strikes the earth in the course of the sun's rotation upon its axis. These same unequally intense rays would reach the planet Saturn either before or after they reached the earth, according to the relative heliocentric longitudes of the earth and Saturn. The sun rotates about 14° a day, so that the angular difference in position of the two planets is to be divided by 14° to indicate the number of days allowance to be made between the dates of corresponding solar and Saturnian measurements. Proceeding on this second hypothesis, extraordinarily close correspondence between the variations of the sun and Saturn was found. Further work of the kind is to be done at Saturn's next opposition. It will be noted that this second hypothesis of the nature of the solar variation relieves us of the great difficulty of understanding how so immense a body as the sun could vary in radiation so rapidly as our observations indicate. We have now only to suppose that there are inequalities of radiation in different directions which may be due to the absorption or scattering of the rays in the coronal regions near the sun. These inequalities may persist with little alteration for weeks. We, however, note them as variations of solar radiation as they sweep by us in the course of the sun's rotation on its axis."

COMETS. In addition to the comets of 1919 mentioned in our last YEAR BOOK, one was dis-

covered by Skjellerup, at Cape Town, Dec. 18, 1919. It passed perihelion about Jan. 1, 1920. Tempel's second periodic comet, discovered in 1873, which has a period of about $5\frac{1}{4}$ years, was found by Kudara, at Kyoto, May 25, 1920. It was then of the 11th magnitude. The same comet was observed by Schaumasse, at Nice, July 18, and, owing to a mistake in the telegraphic announcement of Kudara's discovery, it was for a time supposed to be a different comet. A new comet was discovered by Skjellerup Dec. 13, 1920. At the end of the year it was of the 10th magnitude.

WIRELESS TIME SIGNALS. A large part of the May, 1920, number of the *Monthly Notices*, R.A.S., was devoted to articles on the exchange of wireless time signals by the great observatories of the world. Some of the objects to be attained by concerted work in this line are thus set forth by Professor Sampson: (1) A more exact knowledge of longitudes, implying the final settlement of the most obstinate of geodetical problems. (2) Consistency in time determinations throughout the world. (3) Elimination of small remaining errors in systematic right ascensions of stars. (4) Improvement in the knowledge of clocks as time-keepers and as chronographic instruments. (5) Some reaction to the benefit of radio research. Great progress has been made in apparatus for obtaining autographic registration at the observatories of time signals from remote high-power radio stations. Greenwich Observatory now regularly records the signals from Paris, Nauen, Lyons, and Annapolis, and occasionally those from Darien. An international programme for such work will probably be adopted at a meeting of the *Commission de l'Heure* in 1922. Wireless time signals are to be used in marking out the boundary between South and West Australia, defined by imperial act as the 129th degree of longitude east of Greenwich, and this will be the first step in a comprehensive scheme involving the redetermination of the whole longitude system of Australia. In May, 1920, M. Paul Ditisheim demonstrated a novel method of determining longitudes: viz., by carrying chronometers in an aeroplane. Several comparisons were thus made between the observatories of Greenwich and Paris.

MISCELLANEOUS. Although the Kiel *Centralstelle* for the exchange of astronomical telegrams has been officially supplanted by the agency which Entenist astronomers established at Uccle in 1919, Professor Kobold, in charge of the former institution before the war, has now made arrangements to distribute astronomical announcements by wireless from the Nauen station. The advantages of wireless for this purpose are so obvious that the same method is likely to be adopted by astronomers throughout the world. Prof. E. W. Brown's "Tables of the Motion of the Moon," which had been in preparation for 30 years, were published in three volumes in 1920 and will be used in computing the nautical almanacs of different countries, beginning with those for 1923. The new tables take account of nearly 1500 periodic terms of lunar motion. The Royal Astronomical Society, of Great Britain, celebrated its 100th birthday in 1920. An astronomical journal for the three Scandinavian countries, the *Nordisk Astronomisk Tidsskrift*, was started at Copenhagen at the beginning of the year. A fine observatory presented to the Case School of Applied Science, Cleveland, Ohio, by

the Warner & Swasey Company, of that city, was opened Oct. 12, 1920.

NECROLOGY. Among the eminent astronomers who passed away during the year 1920 were Sir Norman Lockyer, the astrophysicist and editor of *Nature*, August 16; Herman Struve, director of the Berlin-Babelsberg Observatory, August 12; Prof. Eric Doolittle, Flower professor of astronomy at the University of Pennsylvania, September 21; Prof. Arthur Searle, Phillips professor emeritus of astronomy at Harvard, October 23; J. A. Brashear, the great telescope-builder, of Pittsburgh, April 7; and Prof. Giovanni Celoria, director of the Osservatorio di Brera, Milan, August 17.

ATHLETICS, TRACK AND FIELD. The most important feature of the athletic season of 1920 was naturally the Olympic Games contested at Antwerp, Belgium, during the summer months but inasmuch as these games included practically every branch of sports as well as track and field events it seems wise to treat the entire subject under the caption **OLYMPIC GAMES**.

International strife on the track was not confined to the Olympics as in the spring of the year a team of runners representing Oxford and Cambridge universities, England, visited the United States and participated in the University of Pennsylvania relays. The athletes from overseas scored a signal triumph by capturing the 2-mile championship relay in the fastest time ever made in this event. The only consolation obtained by the United States collegians was in the defeat of E. A. Montague, England's star runner, by Gordon Nightingale of New Hampshire College in a special 3-mile race.

The next international clash came when Princeton University sent a team to England to compete in the British A. A. games. The invaders captured six of 10 events in a dual meet with Oxford. Cornell also entered into competition with the English colleges, sending a team of cross-country runners abroad to meet the pick of the Oxford and Cambridge long-distance men. The Ithacans, however, made a poor showing again demonstrating the weakness of the United States athletes in long-distance tests.

The athletic competitions in the United States resulted in many notable performances. Frank K. Foss of the Chicago A. A. surpassed all previous efforts in pole vaulting, reaching the height of his form at the Olympic Games where he vaulted 13 feet $5\frac{1}{4}$ inches. Charles Paddock, the University of California sprinter, equalled the world's record of $9\frac{3}{4}$ seconds for the 100-yard dash.

The senior Amateur Athletic Union championships, combined with the final Olympic try-outs were held at the Harvard Stadium on July 17th, the team honors going to the Chicago A. A. with 35 points. The New York A. C. finished second, one point behind the leader. Other clubs to score were: Illinois A. C., 15; Los Angeles A. C., 14; Olympic Club, San Francisco, 14; United States navy, 11; Loughlin Lyceum, Brooklyn, 7; Meadowbrook Club, Philadelphia, 7; Dubuque College, Iowa, 5; Multnomah A. C., Portland, Ore., 5; University of Washington, 5; University of Missouri, 4; University of Oregon, 3; United States army, 3; Boston A. A., 2; Yale University, 2; unattached, 2; 92d Street Y. M. H. A., New York City, 2; Washington State College, 1; St. Christopher Club, New York City, 1; Cornell College, Iowa, 1.

The individual winners in the senior outdoor meet were: 100-yard dash, Loren Murchison, New York A. C., 10 seconds; 220-yard dash, Charles Paddock, Los Angeles A. C., 21½ seconds; 440-yard run, F. J. Shea, United States navy, 49 seconds; 880-yard run, Earl Eby, Chicago A. A., 1 minute, 54½ seconds; 1-mile run, Joie Ray, Illinois A. C., 4 minutes 16½ seconds; 120-yard high hurdles, H. E. Barron, Meadowbrook Club, Philadelphia, 1½ seconds; 440-yard hurdles, F. F. Loomis, Chicago A. A., 55 seconds; running broad jump, Sol Butler, Dubuque College, 24 feet 8 inches; running high jump, John Murphy, Multnomah A. C., 6 feet 4½ inches; running hop, step, and jump, Sherman Landers, Chicago A. A., 48 feet 7½ inches; pole vault, F. K. Foss, Chicago A. A., and E. E. Meyers, Chicago A. A., tied at 13 feet 1 inch, Foss winning the jump off; putting 16-pound shot, P. J. McDonald, New York A. C., 47 feet ½ inch; throwing 16-pound hammer, Patrick Ryan, Loughlin Lyceum, 189 feet 4 inches; throwing 56-pound weight, P. J. McDonald, New York A. C., 37 feet 11¼ inches; throwing the discus, A. R. Pope, University of Washington, 146 feet 5 inches; throwing the javelin, M. S. Angier, Illinois A. C., 192 feet 10¾ inches.

The junior outdoor A. A. U. championships were also held at the Harvard Stadium, the team winner being the Boston A. A. with 32 points. The United States army men finished second with 23 points. Others to score were: Unattached, 18; New York A. C., 13; Pastime A. C., New York, 12; Paulist A. C., New York, 10; Mohawk A. C., New York, 8; Alpha P. C. C., New York, 7; Jersey Harriers, 5; University of Oregon, 5; 92d Street Y. M. H. A., 5; Hill School, 6; Texas A. and M. College, 5; University of Texas, 3; Massachusetts Institute of Technology, 3; Morningside A. C., New York, 3; Glencoe A. C., New York, 3; University of Idaho, 3; University of Kansas, 2; University of the South, 2; St. Stanislaus College, 2; Los Angeles A. C., 2; Enterprise Club, Philadelphia, 1; United States navy, 1; Syracuse University, 1; Dorchester Club, 1.

The 44th annual outdoor championships of the Intercollegiate Association of Amateur Athletes of America were held at Franklin Field, University of Pennsylvania, on May 28th and 29th. The point honors went to the University of Pennsylvania with a total score of 30½. Princeton finished second with 29 and Dartmouth third with 24. Other point winners were: Cornell, 20; California, 18½; Leland Stanford, 15; Harvard, 11; Penn State, 10; Massachusetts Institute of Technology, 7; Williams, 7; Yale, 5½; New York University, 5; Lafayette 3; Bowdoin, 2; Brown, 2; Rutgers, 2; Amherst, 1½; Pittsburgh, 1; Boston College, 1.

The individual victors were: 100-yard dash, Brown, Princeton, 10½ seconds; 220-yard dash, Brown, Princeton, 21½ seconds; 440-yard run, Hendrixon, California, 48¾ seconds; 880-yard run, Eby, Pennsylvania, 1 minute 58 seconds; 1-mile run, Shields, Penn State, 4 minutes 22¾ seconds; 2-mile run, Brown, Williams, 9 minutes 27¾ seconds; 120-yard high hurdles, Thomson, Dartmouth, 14¾ seconds; 220-yard hurdles, Wells, Leland Stanford, 23¾ seconds; shot put, Cann, New York University, 45 feet 10½ inches; hammer throw, Merchant, California, 150 feet 2¾ inches; broad jump, Landers, Pennsylvania, 23 feet 8 inches; high jump, Landon, Yale, 6

feet 4 inches; pole vault, Myers, Dartmouth, 12 feet 6 inches.

The 20th annual championship of the Western Conference colleges was held at Ann Arbor, Mich., June 4th and 5th. The University of Illinois carried off the laurels with a point total of 40. Michigan finished second with 30 and Wisconsin third with 25½. The Massachusetts Institute of Technology won the New England intercollegiate, scoring 33 points. Williams was second with 18, and Boston College third with 13¾.

In a dual meet contested at Queen's Club, London, Oxford defeated Cambridge by 5½ to 4½, first places only being considered.

ATKINSON, WILMER. Journalist, died at Philadelphia, Pa., May 10. He was founder of the *Farm Journal*. He was born at Warwick, Pa., June 30, 1840, and began, with H. M. Jenkins, the first daily paper in Delaware (1866). In 1877 he founded the *Farm Journal*, at Philadelphia, of which he remained the editor.

ATLANTA, GA. See CITY PLANNING.

ATOMIC STRUCTURE. See PHYSICS.

AUSTRALIA, COMMONWEALTH OF. A self-governing dominion of the British Empire comprising the island continent of Australia, with its dependencies. It consists of the six original states of New South Wales, Victoria, Queensland, South Australia, Western Australia, and Tasmania. The present government dates from Jan. 1, 1901, when the Act of Union was passed. It also comprises the two territories known as Western Territory and the Federal Territory. The former was transferred to the Commonwealth by South Australia and the latter by New South Wales, both on Jan. 1, 1911. The seat of government is provisionally at Melbourne, but eventually will be at Yass-Canberra, the site acquired in 1910 from the state of New South Wales.

AREA AND POPULATION. The following table giving the estimated area in square miles and the population according to the census of April 3, 1911, together with the estimates of June 30, 1919, is taken from the *Statesman's Year Book* (1920):

States and territories	Area, sq. miles	Census, April 3, 1911	Estimated June 30, 1919
New South Wales ..	309,432	1,646,734	1,962,989
Victoria	87,884	1,815,551	1,467,188
Queensland	670,500	605,813	712,827
South Australia	380,070	408,558	455,944
West Australia	975,920	282,114	323,220
Tasmania	26,215	191,211	210,881
Northern Territory ..	523,620	3,310	4,921
Federal Territory	940	1,714	2,573
Commonwealth	2,974,581	4,455,005	5,140,543

Since the year 1884 the population of Australia has about doubled. The country has always differed materially from older communities in its sex distribution. Whereas in the latter the number of males and females is approximately equal, with a small excess of females, in Australia, under normal conditions, males have always been in excess on account of the preponderance of males among immigrants. The economic development of Australia was of a nature especially to attract male rather than female immigrants, as it resulted from extensive mineral discoveries and the exploitation of the great natural resources, pastoral, agricultural, etc. In the census of 1911, after over 123

years of settlement, the males exceeded females in the proportion of 3.84 in every 100 of the population. The war changed this excess of males into a deficit. In 1916 there was an excess of females for every 100 of the population amounting to 1.50 per cent; in 1917, 1.97 per cent, and in 1918, 1.67 per cent. The age distribution has also been entirely different from that of older communities and this too, has been due to the importance of immigration in the growth of population, for the majority of immigrants are in the prime of life. In 1911, 64.8 per cent of the population were between the ages of fifteen and sixty-five. The aborigines have been rapidly decreasing. No precise figures can be given because no serious effort has been made under any of the censuses to determine the precise figure. Various estimates have been made from time to time and according to most of these the aborigines numbered about 150,000, but more recent estimates have given lower figures. In 1915, for example, the official known as the chief protector of the aborigines in Queensland, estimated the total at 61,705, a little more than one-half of these being in Western Australia, and the next largest number (15,000) in Queensland. The general tendency at present is to place the number under 100,000.

The estimated populations of the capital cities with their suburbs, Jan. 1, 1919, were as follows: Sydney, New South Wales, 792,700; Melbourne, Victoria, 723,500; Brisbane, Queensland, 181,199; Adelaide, South Australia, 235,751; Perth, Western Australia, 133,000; and Hobart, Tasmania (Jan. 1, 1918), 40,352.

Marriages, births, and deaths for 1918 as given by the *Statesman's Year Book* for 1920 were as follows:

States and territories	Marriages	Births	Deaths	Surplus of Births
States:				
New South Wales.	13,194	50,709	18,816	31,893
Victoria	9,156	31,597	15,177	16,420
Queensland	4,815	19,536	7,151	12,385
South Australia ..	3,190	11,357	4,890	6,467
Western Australia.	1,612	7,106	2,833	4,273
Tasmania	1,131	5,280	1,802	3,478
Territories:				
Northern Territory	39	105	74	31
Federal Capital Territory	4	49	6	43
Total	33,141	125,789	50,249	75,490

In 1918 there were 78,925 arrivals and 59,247 departures, thus showing a considerable increase of the former for the first time in some years owing to the fact that in previous statistics the return of the expeditionary forces was included.

RELIGION AND EDUCATION. The census of 1911 gave the number of those who were registered as Christians at 4,274,414. The chief denomination is the Church of England, whose members numbered, in 1911, 1,710,443. The other denominations in the order of their numerical importance were, in 1911: Roman Catholic, Presbyterian, Methodist, Baptist, Congregational, Lutheran, and Church of Christ. In the census of 1911, 36,785 were entered as non-Christians and about 140,000 were given as of no religion or unwilling to state their religious beliefs.

Primary education is free of charge and compulsory. In late years many improvements have been made in educational matters such as school administration, sanitation, lighting, building,

etc., and many reports have been made after comparative study of the school systems in other countries. In general, the kindergarten system has been more widely employed and has been a tendency to replace the older and more abstract methods by concrete methods. The education of children in sparsely settled districts has always been a difficult problem and attempts to solve it have been made by means of provisional schools, that is to say, schools formed of about a dozen pupils and later changed into the ordinary public schools when the attendance became sufficient; by half-time schools taught by visiting teachers; by instruction at the hands of intermittent teachers; by traveling schools, railway camp schools, etc.

In 1917 the state or public schools in the Commonwealth numbered 8992 with 24,177 teachers and 764,980 pupils; and the private schools numbered 1685 with 8028 teachers and 177,126 pupils. In 1918 New South Wales had 3424 government schools with 9022 teachers and 289,655 pupils enrolled; 698 private schools with 3806 teachers and 73,560 pupils. Victoria had 2373 state schools with 6455 teachers and 254,461 pupils; 493 registered schools with 2,010 teachers and 58,996 pupils. Queensland had 1571 elementary schools with 4134 teachers and 91,341 pupils in average attendance; private schools 160 with 887 teachers and an average attendance of 18,167 pupils. South Australia had 913 government schools with 73,502 pupils; 168 private schools with 13,369 pupils (1917). Western Australia had 667 government schools with 48,431 pupils; 127 private schools with 11,619 pupils. Tasmania had in 1917 486 public elementary schools with 36,350 pupils. There are in addition various high, technical and secondary schools in all the states; and each of the capital cities of the states is the seat of a university: Sydney (1918), students 2017; Melbourne (1918), 1448 students; Brisbane (1918), teaching staff 29, students 227; Adelaide (1913), students 720; Perth (1913), students 182; and Hobart (1917), students 93.

PRODUCTION. The following table taken from the *Statesman's Year Book* for 1920 shows the area of the crops and their yield in 1917 and 1918:

Year ended June 30	1917 Acres	1918 Acres
Area under cultivation	5,168,030	4,462,916
Principal crops	Area Acres	Produce Bushels
Wheat:		
Grain ..	3,806,604	86,598,000
		Tons
Hay	693,605	813,768
		495,180
Maize, grain	155,378	4,383,480
		145,754
Barley:		
Grain ..	5,195	73,870
		Tons
Hay	866	1,205
		844

		82,591
Hay	161,723	210,953
		118,917
Potatoes ..	22,449	45,331
		22,580
Lucerne (hay)	61,584	147,865
		Tons
Tobacco ..	952	921*
		791

* Crop failed.

In 1917-18 the total area under crops was 14,298,982 acres and the total value of the agricultural production was £57,967,307. The acreage of wheat for 1918-19 was valued at £7,991,026, with a yield of 75,146,172 bushels; oats (1917-18), at £580,000 with a yield of 9,850,000 bushels. The sugar crop for 1917-18 was placed at 327,589 tons and the estimated yield for 1918-19 at 208,000 tons. No statistics of manufactures were available later than for the year of 1917 when the number of establishments was 15,179 and of employees 321,670. The output of manufactures in the year of 1917 amounted to £69,807,000. See AGRICULTURE.

GRAZING. Australia is among the chief sheep raising countries of the world. Though the number of sheep has declined of late years, in 1918-19 the sheep numbered 87,925,982, of which nearly half were in New South Wales. At that time horses numbered 2,536,147; cattle, 12,658,762; and pigs, 1,045,810. Wool production in 1918-19 was 652,920,171 pounds. Wool production in 1917-18 was placed at 673,864,083 pounds and valued at £37,062,000 as compared with 547,702,295 pounds valued at £35,964,000 in the preceding year and 711,134,203 pounds in 1913-14. The exports of wool in 1917-18 were placed at about £311,239,307. See AGRICULTURE and DAIRYING.

MINING. Australia has been one of the chief producers of gold in the world and down to the end of 1918 it produced gold to the value of £594,536,723. The gold production reached its highest when it stood at £16,294,686, but after that time it steadily decreased. The leading states in gold production are: New South Wales, Victoria, and Western Australia. The total value of mineral production in Australia down to the end of 1918 was £957,862,623. The following table shows the value of the production of the principal minerals for each state and northern territory and for the commonwealth during the year 1918:

Minerals	N. S. W. £	Victoria £	Queensland £	S. Aust. £	W. Aust. £	Tasmania £	Nor. Ter.* £	O'wealth. £
Gold	369,743	674,655	567,371	26,252	8,723,183	44,724	2,229	5,408,157
Silver and lead	5,789,509	1,319	36,645	10,492	189,636	127,176	200	6,104,977
Copper	696,580	2,087,751	828,556	66,146	776,106	9,648	4,464,787
Tin	548,876	24,481	251,755	76,952	488,798	41,432	1,432,294
Coal	4,941,807	367,640	572,805	204,319	37,676	6,123,747
Other	1,644,649	84,547	225,098	574,849	5,341	276,094	39,221	2,799,299
Total	13,941,164	1,102,642	8,740,925	1,489,649	4,265,577	1,750,574	92,780	26,883,261

* Year ended 30th June.

MANUFACTURES. Statistics in respect to growth of manufactures are defective, but between 1901-17, the number of factories in the Commonwealth increased from 11,143 to 15,179 and the number of employees from 197,783 to 321,670. The largest number in 1917 were engaged in the clothing and textile industries; industries connected with food and drink; metal works, machinery, wood-working; and the making of vehicles and fittings for transport, saddlery, harness, etc. Female labor in factories is regulated in all the states by act of Parliament. In 1917 the average number of females in the manufacturing industries in the Commonwealth was 87,711 as compared with 233,959 males. The employment of children in factories is also regulated by act of Parliament. In general the term child denotes any one under sixteen years

of age. The minimum age is fourteen years in all the states with the exception of South Australia, where it is thirteen, and Victoria where for females it is fifteen. In 1917 the average number of children employed in factories amounted to 14,794.

During the past few years there has been an active development of the Australian woolen industry, although it was still estimated in 1920 that only about 3 per cent of the wool produced in the country was manufactured. In 1919-20, the various government cloth factories were considerably extended. The capital invested in woolen manufactures in 1920 was estimated at about £3,000,000 at pre-war prices, and employing about 6000 persons. A number of new industries sprang up during the war, including the manufacture of electrical materials, hardware, chemicals, paints, confectionery, chocolate, copra, sheep-dips and coal-tar products, and there was a considerable manufacture of agricultural and other implements. The rubber, iron, and steel factories were largely expanded. It was estimated in 1920 that about \$450,000,000 was invested in Australian manufactures, an increase of 40 per cent in ten years. A new tariff was in process of formation in 1920 to protect the industries that had arisen as a result of the war.

COMMERCE. There was a great decline in both imports and exports in the first year of the war, but there was a recovery to some extent in 1915-16. The total foreign trade of Australia for the fiscal year 1919 amounted to £201,243,293, which at the average conversion rate of \$4.50 to the pound sterling amounts to \$905,594,818. As compared with the previous year, this is an increase of £65,386,293, or \$294,238,318. The total imports from the United States for the calendar year 1919 amounted to £27,299,459, or, at \$4.50 to the pound sterling, a total of \$122,847,566. As illustrating the total foreign trade of Australia for the fiscal years 1918 and 1919,

and the pre-war year 1913, the following figures are given:

Years	Imports	Exports	Total
1913	\$358,870,500	\$353,574,000	\$712,444,500
1918	273,699,000	837,657,500	611,856,500
1919	426,806,254	479,288,565	905,594,818

The leading imports in 1917-18 and in 1918-19 were in thousands of pounds sterling as follows: Metal manufactures £7206 and £17,034; apparel £3302 (exclusive of hats, caps, boots, and shoes) and £8091; drugs, chemicals, and fertilizers £3358 and £4407; machines and machinery, £2095 and £3269; woollens £1895 and £904; oils in bulk £2686 and £3721; bags and sacks £2659 and £3934; paper £2107 and £4219; tea £1551 and £1956; timber £1427 and £2177;

spirits £1252 and £1174; tobacco £548 and £998. In 1918-19 the largest item of all was textiles with a value of £25,956. Tinned plates and sheets in 1918-19 amounted to 2134.

Leading exports in 1917-18 and 1918-19 in thousands of pounds sterling were: Wool, 24,587 and 42,767; wheat, 5990 and 11,335; copper, matte, ingots, bars, and ore 3115 and 2221; lead, pig and matte 3212 and 2891; skins and hides 21,856 and 4404; beef 3699 and 2473; flour 4420 and 5819; zinc and concentrates 351 and 430; leather 779 and 2197 (including manufactures); butter 4904 and 3193; mutton and lamb 453 and 1298; tin ingots 1065; tinned meat 2363 and 3798; tallow 909 and 2172. Other important items in 1918-19 were: Manufactures of metal, 1432; chemicals and fertilizers, 1216; and milk, 1097. Trade with the chief countries in 1917-18 was as follows:

From or to	Imports (1917-18) £	Exports (1917-18) £
United Kingdom	24,871,090	37,637,844
Canada	1,778,320	785,130
New Zealand	1,631,682	4,009,960
India	4,641,276	4,507,156
Ceylon	1,353,436	62,211
South African Union	187,398	1,092,430
Java	701,435	1,028,973
Belgium	1,346
France	106,377	1,926,375
Germany	11,558
U. S. of America	15,193,318	10,650,034
Japan	5,017,860	3,340,064
Russia	9	75,072
Italy	222,347	1,278,725

Australia's trade with the United States for the fiscal year 1919, according to the revised returns of the Commonwealth Bureau of Statistics, amounted to \$166,215,240, of which \$125,672,963 represents imports from the United States to Australia, and \$40,542,277 were exports from Australia to the United States. The trade of Australia with the United States for the fiscal years 1914, 1918, and 1919, was as follows:

Years	Imports	Exports	Total
1914	\$48,920,841	\$22,385,007	\$71,305,848
1918	\$9,542,348	\$7,824,758	\$17,367,106
1919	\$25,672,963	\$40,542,277	\$66,215,240

FINANCE. Commonwealth revenue and expenditures are given as follows for the fiscal years ending June 30:

	1916-17 £	1917-18 £	1918-19 £
Revenue:			
Customs	12,373,664	9,486,555	11,600,539
Excise	3,236,623	3,737,757	5,821,483
Land tax	2,121,952	2,123,779	2,108,689
Probate and succession duties	1,062,168	947,232	918,968
Income tax	5,621,950	7,885,514	10,376,832
Entertainments tax	110,683	245,899	357,907
War times profits tax	680,008	1,206,647
Post, telegraph, and telephone	5,498,517	5,762,190	6,090,798
All other	3,936,877	5,958,413	5,442,063
Total revenue	33,962,434	36,327,347	43,921,926
Commonwealth Expenditure:			
From revenue	28,243,470	28,102,350	37,871,231
From loans	53,114,237	56,898,556	63,633,000
Total Commonwealth expenditure	81,357,707	85,000,906	101,504,231

Including:

	1916-17	1917-18	1918-19
Expenditure for war purposes	61,541,566	66,958,360	83,457,567
Old age pensions	3,453,344	3,858,990	3,879,240
Maternity allowances	662,080	634,428	620,080
Post, telegraph, and telephones	4,853,886	4,920,251	5,016,137
Payments to States:			
Out of revenue	6,270,419	6,340,374	6,454,333
Out of loans	7,263,180	2,881,385	8,042,767

For 1919-20 the estimated revenue was £46,346,635 and the estimated expenditures estimated at £49,570,203.

ARMY AND NAVY. The present military system is based on the defense acts of the Federal Parliament from 1903 to 1918, the main working principles being embodied in the acts of 1903 and 1904. These acts were amended by enormous subsequent enactments of which one of the most important was the act of 1909, providing for compulsory military and naval training with regulations for enrollment, exemption, etc. Under the defense acts of 1903 and 1904 every male inhabitant between the ages of 18 and 60 was liable to military service in time of war. To this the act of 1909 added the principle of universal liability to military training, being the first measure of this kind in an English-speaking community. Those liable to military training were divided into junior cadets, senior cadets, and citizen forces. Training for the junior cadets was prescribed between the ages of 12 and 18 and for senior cadets between the ages of 14 and 18. For the citizen forces, that is to say, men between the ages of 18 and 26, training was required for 166 days each year for two years and thereafter they were registered for six years. In November, 1916, an Australian army reserve was formed for the purpose of making use of the experience gained in the war. The enlistment was voluntary. The membership on April 30, 1919, was about 28,000. The total strength of the military force in 1918 was 122,186, nearly four times as great as in 1914. In 1920 a military defense scheme was under discussion. It provided for an organization on the basis of divisions which should be officered by citizen soldiers. It retained universal training (compulsory for 10 weeks in the first year of service), encouraged voluntary enlistments, and provided for an air force. It contemplated a force of 130,000. One of its features was a combined naval and military air board.

In 1920 the sea-going fleet consisted merely of six submarines, six destroyers, the light cruiser *Brisbane*, the training cruiser *Sydney*, and two sloops.

In 1909 the Commonwealth government decided to create an Australian naval force to replace the squadron maintained under an arrangement with the imperial government and the building of the fleet and the training of the crews were at once begun. Some small craft were ready in 1910 and in June, 1913, the battle cruiser, *Australia*, arrived in Australian waters. See **NAVAL PROGRESS.**

PENSIONS. After 1916 the rates under the old age and invalid pension acts were not to exceed £32 10s. a year and the pensioner's whole income was not to exceed £58 10s. a year. The qualifications were: Attainment of the age of 65 years and residence in Australian territory for 20 years for old age pensions and five years

for invalid pensions. Under the maternity act of Oct. 9, 1912, a bonus was paid up to a maximum of £5 for every child of white parents born in Australia. Disbursements for old age and invalid pensions in 1918-19 were £4,025,892. The maternity allowance for 1918-19 was £620,080. Old age pensioners in the commonwealth on June 30, 1919, numbered 95,969; invalids, 31,999; war pensioners, 181,529.

COMMUNICATIONS. The following table gives the statistics for federal, state, and private railways for the year 1917-18.

State or territory	Government lines— State Federal Miles Miles		Private lines available for general traffic Miles	Total open for general traffic Miles	Private lines used for special pur- poses only Miles	Grand total Miles
New South Wales	4,679.81	185.02	4,864.33	160.83	5,025.16
Victoria	4,151.64	24.94	4,176.58	46.12	4,222.70
Queensland	5,295.15	555.77	5,788.92	918.48	6,769.40
South Australia	2,242.33	1,075.32	33.80	3,351.45	5.00	3,356.45
Western Australia	3,491.08	453.94	278.35	4,223.37	680.96	4,904.33
Tasmania	588.00	162.86	750.86	30.85	781.71
Northern Territory	199.56	199.56	199.56
Federal Territory	4.94	4.94	4.94
Total	20,447.51	1,733.76	1,240.74	23,360.01	1,842.24	25,264.25

The long-discussed question of a single gauge for the railway lines of the Commonwealth advanced a step nearer solution as the result of a conference between the engineer-in-chief of the Australian Commonwealth railways and the engineering experts of the railways of the various states held during the year at which it was decided that the standard gauge of 4 feet 8½ inches was the most suitable for adoption.

As early as 1913 this action was considered and then the estimated cost of unification was £37,164,000, but since that date the track mileage had been considerably increased, and the cost of material nearly doubled, so that the cost of unification would be a very serious matter for the states other than New South Wales, which had standard gauge track. During the year a trial of the third rail system was made at Tocumwal with success and it was claimed that through trains could be run over the whole of Australia without disturbing any of the existing tracks. The estimated cost of a third rail installation was £3,500,000, and the time of completion was stated to be 18 months.

The number of post and receiving offices on June 30, 1918, was 8398. The total tonnage entered and cleared from 1913 to 1917-18 was as follows:

1913 ..	3,985	10,601,948
1914-15 ..	3,211	8,599,258
1915-16 ..	3,324	8,538,322
1916-17 ..	2,986	7,694,442
1917-18 ..	2,197	5,031,750

GOVERNMENT. The Commonwealth of Australia is a federal state forming a dominion of the British Empire and consisting of the six original states, the former colonies, as follows: New South Wales, Victoria, Queensland, South Australia, Western Australia and Tasmania; also of the northern Territory transferred by South Australia to the Commonwealth, Jan. 1, 1911, and the Federal Territory transferred on the same date by New South Wales. Such legislative power as is not reserved to the states is vested in a Federal Parliament consisting of a Senate and a House of Representatives. The

Senate is made up of senators selected for six years, six from each state; and the House of Representatives consists of twice as many members as there are senators (as nearly as this is possible), the representation of states being in proportion to their population as shown by the latest statistics. The latest enumeration in 1920 being that of 1911, the representation was as follows: New South Wales, 27 members; Victoria, 21; Queensland, 5; and Tasmania, 5. The executive power is vested in the King, as represented by a Governor-General and in an

executive council of responsible ministers who must be members of Parliament. The Governor-General at the beginning of 1920 was Sir R. C. Munro-Ferguson. After the general election of December, 1919, a new ministry was formed to replace the Coalition Ministry which had come into power Feb. 17, 1917, and was reconstituted in March, 1918. Its members were as follows: Mr. W. M. Hughes, Prime Minister and Attorney-General; Sir Joseph Cook, Navy; W. A. Watt, Treasury; George Foster Pearce, Defense; E. D. Millen, Repatriation; L. E. Groom, Commerce and Railways; Alexander Poynton, Home and Territories; W. M. Greene, Customs; George H. Wise, Postmaster-General; E. J. Russell, Vice-President of the Council. The High Commissioner for Australia in London, in 1920, was Andrew Fisher, appointed Oct. 26, 1915.

HISTORY

PARLIAMENT. According to the final returns of the election of December, 1919 (noted in the preceding YEAR BOOK), the Nationalists had 39 seats in the Lower House, the Labor party, 26, and the so-called Country party, 10. The new Parliament met February 28th and proceeded to criticize sharply the Prime Minister, Mr. Hughes, for his use of the war power in an attempt to rid the country of strikers. His policy of prohibiting banks or any individuals from giving money or goods to strikers was unsuccessful.

On November 11th the House of Representatives at Melbourne expelled a Labor member, Mr. Mason, formerly Postmaster-General, on the charge of a disloyal speech on behalf of the late Mayor of Cork. The motion was made by the Prime Minister and the vote was 34 to 17.

NEW TARIFF. Three rates were provided by the new Australian tariff: First, the British preferential rate which applied to imports from the United Kingdom; the intermediate rate, to be granted after the conclusion of reciprocity agreements; and third, general rates applicable to all countries not entitled to either of the two preceding. The chief object of the tariff as defined by the Prime Minister was to protect the industries developed during the war, to en-

courage others that were desirable, and to diversify and extend existing industries.

PARLIAMENT. Toward the close of the year an Industrial Peace Bill was under consideration providing for central and district councils including an equal number of employers and employees for the settlement of industrial disputes, to supplement the Arbitration Court which was overcrowded with work. Its functions, which covered the whole industrial field, were advisory.

The immigration question was much discussed during the year. Plans were made to attract settlers and a bureau for that purpose was established in London. The Australian Parliament appropriated a considerable sum for the building of homes for workmen. At the close of the year consumers were protesting against the high retail prices and there was a demand for downward revision of the tariff. The War Precautions Act was continued until Jan. 1, 1922, and under that date it was required that foreign traders must first obtain permission from the Federal government.

"WHITE AUSTRALIA." The policy generally known as "White Australia" was set forth in 1920 in the speech of the Prime Minister, W. A. Hughes, in October. He compared it to the American Monroe Doctrine and to the British necessity of controlling the seas, placing it among the most vital of Australian policies and saying it was not a matter that could be submitted to the League of Nations. He declared that he did not believe there were 5 per cent of the Australians who were not heart and soul for this policy. The enemies of Australia must be kept outside of Australia. The first line of defense, according to Mr. Hughes, must be the navy and the air. A policy of liberal appropriations to the naval and air forces was essential.

THE HUGHES GOVERNMENT. In spite of its small majority in the Federal Parliament, the Hughes ministry continued throughout the year. No combination was formed against it on a decisive issue between the opposing parties, namely the Labor party and the Country party. The strength of the ministry in the course of the year was weakened somewhat by the retirement of Mr. Watt from the cabinet.

AUSTRIA. A republic, proclaimed, Nov. 12, 1918, and comprising territories within the limits laid down by the Treaty of Saint Germain, signed Sept. 10, 1919. The boundaries are given in detail below; they included roughly the territories corresponding to the former Austrian Provinces of Upper Austria, Lower Austria, Northern Tirol, Salzburg, Styria, Carinthia, and Vorarlberg, and they were later to include the German and Western portion of Hungary (q.v.). The area of the former Austrian Provinces was 39,012 square miles and the population according to the census of Dec. 31, 1910, was 7,529,935. A census of the new republic was taken on Jan. 31, 1920.

THE CENSUS OF 1920. The following account of the census of 1920 was supplied by the United States Bureau of Foreign and Domestic Commerce: Austria's territorial limits in 1920 had a population of 6,067,430. Compared with the corresponding figure for 1910 the census of 1920 showed a loss of 227,209, or 3.6 per cent. The city of Vienna alone, with a population of 1,842,005 in 1920, showed a loss of 189,493, or 9.3 per cent. Ten other cities, with a population of 20,000 or more each, gained 20,140, or 4.3 per

cent, while the smaller cities and the country districts showed a loss of 57,856, or 1.5 per cent. It was estimated unofficially that the number of Austrians killed in battle was 160,000 to 180,000 and the total loss due directly or indirectly to the war was 814,461. This figure was based on the calculation that if there had been no war and the population had increased in 1911-19 at the same rate as it had grown in 1901-1910 the population of Austria would have numbered 6,881,891 at the end of 1919. The population of the several Provinces and the principal cities as determined by the census of 1920 is shown in the following table:

Provinces	Population
Lower Austria	3,313,155
Styria	946,721
Upper Austria	857,284
Tirol	306,153
Carinthia (including the plebiscite district)	297,257
Salzburg	218,877
Vorarlberg	133,033
Total	6,067,430

Cities	Population
Vienna	1,842,005
Graz	157,632
Linz	93,478
Innsbruck	55,659
Salzburg	36,450
Wiener-Neustadt	35,023
Klagenfurt	26,111
St. Götten	23,061
Villach	21,896
Baden	21,095
Steyr	20,284
Total	2,332,639

These figures show a striking disproportion between the urban and the rural population. The 11 cities listed in the table contained 38.44 per cent of the republic's population, Vienna alone holding 30.36 per cent of the total. The war naturally increased the disproportion between the sexes. The census of 1920 showed 2,904,478 males and 3,162,952 females in Austria, or 1089 women for each 1000 men. The male population decreased 205,864 or 6.61 per cent as compared with 1910, while the number of females diminished by only 21,545 or less than 1 per cent. The male population suffered the largest losses in Vienna (121,868) in the Province of Vorarlberg, and in the city of Klagenfurt. In these districts the number of women also decreased, but in all other districts they showed an increase. The rate of increase was naturally smaller than the rate observed in the previous decade, owing to the fall in the general birth rate. The disproportion between the sexes was greatest in Vienna: 1163 women per 1000 men (in 1910 the ratio was 1086 to 1000). The smallest percentage of women was to be found in Carinthia, Tirol, and Styria—1050 women per 1000 men. In 1910 both Carinthia and Tirol had an excess of males.

EDUCATION. Elementary instruction is free and attendance compulsory as a general rule, between the ages of six and 14. In 1912 there were in the former division known as Austria, 23,247 elementary schools with 107,374 teachers and 4,471,393 pupils. In 1918 in the new republic there were 4763 elementary schools with 30,451 teachers and 913,999 pupils. Secondary education is provided in the gymnasia and the *realschulen* of which in 1917-18 the former numbered 73 with 20,955 pupils and the latter 38, with

14,632 pupils. In the former Austrian state there were eight universities. In the new republic there remained only four of these, namely, those of Vienna, Graz, Innsbruck, and Salzburg. They are all maintained by the state. Besides the universities, education was provided in technical schools, mining, high schools, and various schools for special purposes.

ECONOMIC CONDITIONS. It appeared in the summer of 1920 that Austria had raised a little more than a quarter of the food it needed for the fiscal year, and could probably support its 6,000,000 people till the middle of November or December, after which time its population must live on food obtained from other countries. The year 1913 was the last in which normal conditions prevailed in those regions which form the present Austria, and in that year the production of staples was as follows: 300,000 tons of wheat, 650,000 tons of rye, 235,000 tons of barley, 545,000 tons of oats, 404,000 tons of sugar beets, 1,716,000 tons of potatoes. Even in a good year such as 1913, the amount of grain for bread was only 11,850,000 tons. If from this amount 45 per cent is deducted for seed, bran, and other by-products, there would be only 652,000 tons of home-grown flour for a population of 6,500,000. It was estimated by the Austrian Foreign Office that even in a favorable year before the war Austria, as it now exists, would have needed to import 482,000 tons of grain for bread, 272,000 tons of potatoes, 360,000 cases of milk, 112,000 tons of sugar, 38,000 tons of legumes, 40,000 tons of rice, 33,000 tons of meat, 40,000 tons of lard, 12,000 tons of cheese, 1,800,000 tons of fish, and 859,000 tons of grain for cattle and industry. In 1920 these quantities, though needed, were not and could not be imported. Most of the people were dispensing with many things that were formerly regarded as necessities. The scarcity of food, however, was not due to neglect of agriculture. Austria had about 40 per cent of its employed population, or 1,276,000 persons, engaged in agriculture and forestry. The care with which the land is cultivated is reflected in the number of small farms in Austria. There are 819,564 landed properties—both private and public—most of them small holdings, under 5 hectares (12.35 acres) each. These include not less than 567,955 holdings under 5 hectares, aggregating an area of about 1,482,000 acres; 248,000 holdings from 5 to 200 hectares, aggregating an area of about 12,350,000 acres; 2123 holdings from 200 to 500 hectares, aggregating an area of about 1,600,000 acres; 1226 holdings over 500 hectares each, aggregating an area of a little over 7,410,000 acres. The public property covers a little more than 100,000 hectares, or 250,000 acres. See **AGRICULTURE**.

FINANCE. The 1919-20 budget was as follows: Revenue, 3,630,276,014 kronen; expenditures, 10,897,629,297. The following details are supplied by the *Statesman's Year Book* for 1920:

Revenue	Millions of kronen
Various revenues	1,286
Railways	990
Monopolies	892
Expenditure	Millions of kronen
Interest on debt	211
Interior	115
Army	555

Expenditure	Millions of kronen
Railways	1,183
Subventions for food	3,100
Liquidation of old debt	1,551
Civil pensions	98
Military pensions	31

ARMY. For statistics of Austria-Hungary before the war, see preceding issue of the *YEAR BOOK*. The defeat of the Central Powers naturally brought about the complete collapse of the military system and the terms of the Treaty strictly limited the military strength of the new Austrian republic. At the close of January, 1919, the government made an attempt to organize a limited military force by the creation of a Volkswehr or defense force, which in August, 1919, was estimated at a strength of 180,000 men. By the terms of the Treaty of St. Germain compulsory military service was abolished and the military forces were limited to a strength of 30,000 officers and men, which might be organized either in divisions or in mixed brigades. The details of the organization were not complete in 1920, but the following points were among those which had been determined: It was provided that all officers should be regulars; that newly appointed officers must serve for 20 consecutive years and that officers now serving must continue to serve to the age of 40. Enlistment of officers and privates was for not less than 12 consecutive years of which at least six were to be passed with the colors. By the terms of the Treaty all mobilization measures were forbidden; police officers, gendarmes, etc., were to be kept down to the number employed in those capacities in 1913; and members of clubs and educational establishments were not permitted to concern themselves with military matters. As to the air forces of Austria, they were to be demobilized within two months after the ratification of the Treaty, and the future army must not include military or naval air forces, all the material pertaining thereto being forfeit to the Allies. During the six months following the ratification of the Treaty, the manufacture of air craft or any parts thereof was forbidden. See **NAVAL PROGRESS**.

GOVERNMENT. The Austro-Hungarian Empire or the Dual Monarchy of Austria and Hungary was disrupted and redistributed in the course of events beginning in October, 1918, when portions of the former Empire began to split off and to declare their independence. Czechoslovakia proclaimed its independence, October 20. German Austria in its National Assembly declared its independence, October 21. The declaration of independence of the Austrian Ukraine followed, October 23; that of the Southern Slav States under the name of Jugo-Slavia, October 30, and that of Hungary, October 31. See **CZECHO-SLOVAKIA**; **HUNGARY**; **JUGO-SLAVIA**. When the Austrian Republic was proclaimed, Nov. 12, 1918, the government was in the hands of the National Assembly which appointed a provisional cabinet and arranged for the election of a National Constituent Assembly. This election was held Feb. 16, 1919, on the basis of universal suffrage and the new assembly was the only source of governmental power at the beginning of 1920. It was composed as follows: Social Democrats, 72; Christian Socialists, 69; German Nationalists, 26; other parties, 3. Un-

der the Constituent Assembly, March 15, 1919, a ministry was appointed which was holding office in 1920, as follows: State Chancellor and Minister of Foreign Affairs, Dr. Karl Renner (Social Democrat); Vice Chancellor, Jodok Fink (Christian Socialist); Minister of Commerce, Johann Zerdik (Non-Party); Minister of Social Insurance, Ferdinand Hanusch (Social Democrat); Minister for Military Affairs, Dr. Julius Deutsch (Social Democrat); Minister for Socialization, Dr. Wilhelm Ellenbogen (Social Democrat); Minister of Agriculture, Joseph Stöckler (Non-Party); Minister of Finance, Richard Reisch (Non-Party); Minister of Justice, Dr. Rudolf Ramek (Christian Socialist); Food Controller, Dr. Johann Löwenfeld-Russ (Non-Party); Minister of the Interior and of Education, Mathias Eldersch (Social Democrat); Minister of Railways, Dr. Ludwig Paul (Non-Party); and Minister of Constitutional Reform, Michael Mayr (Christian Socialist). For new ministry after the October elections, see below, under *History*.

On Feb. 15, 1920, the draft of a constitution was published, making Austria a Federal Republic in which Vienna was to be separated from Lower Austria and to form a constituent part of the new state. The draft proposed a double legislative authority consisting of the Federal Diet and the Council, the President of the Diet to be President of the confederation. The component parts of the state or "lands" were each to have its provisional Diet and were to continue under the forms of the former provincial legislative bodies. Under the constitution as adopted the Republic became a confederation of the following states: Lower Austria, which was subdivided into the province of Lower Austria and the city of Vienna; Upper Austria, Styria, Carinthia, Salzburg, Tirol, Vorarlberg, and Burgenland. The last-named was the portion of Western Hungary which had been awarded to Austria by the Peace Treaty. The executive power was in a president elected by the Federal Assembly. Legislative power was in the Federal Assembly which consisted of two chambers, namely: the National Council elected by direct proportional vote and the Federal Council elected by the Legislatures of each state. The Federal Council consisted of 46 representatives of whom 12 were from Vienna, 10 from the Province of Lower Austria, 6 each from Upper Austria and Styria, and 3 each from the other States, with the exception of Burgenland whose representation was not yet determined. The National Council consisted of 175 members.

HISTORY

GERMANY AND AUSTRIA. On April 22nd, Dr. Renner announced that after the ratification of the Treaty, Austria would ask permission to enter the League of Nations in order that she might then be re-united to Germany. On June 20th, President Seitz publicly expressed this view and it was approved by the greater part of the Austrian press, several of the most influential journals having already carried on an active campaign to this end. A German labor federation was organized in Vienna on behalf of German unity and on June 22nd a motion was offered in the Assembly for the union of Austria with Germany. The Assembly voted that the question should be submitted to the people in

the elections of October 17th and meanwhile it invited the government to take measures for effecting the union. The Assembly was unanimously for this action. The question whether such a union was in conformity with the Treaty of Versailles was much discussed and provoked especially sharp replies in the negative on the part of the French whose point of view may be illustrated by the following summary of the articles written by the former President of France, M. Raymond Poincaré, in October: It was admitted that Austria had been left in a critical condition by the Treaty—having a territory of only about 83 square kilometers and a population of little more than 6,000,000, of whom 2,000,000 were at the capital, Vienna. It was described politically as a state which had a very large head and a very small body. Within its limits there was little land for the raising of grain and its situation in respect to foodstuffs was deplorable. The public finance was in a chaotic condition, the value of the crown having fallen to eight centimes and the country being flooded with paper currency. Nevertheless, the Austrian section of the Committee on Reparations had shown much zeal in devising means for relief. Moreover there were other little states in Europe less populous than Austria which prospered and Austria was geographically in a good position for the development of commerce, being on the route from Germany and Czecho-Slovakia to the Mediterranean and to the Adriatic and on the route from western Europe to Asia Minor. She also possessed large mineral resources and forest wealth; and the water power, though as yet undeveloped, was fairly considerable. The Allies were ready to aid her in all possible ways including the development of her resources, the opening of food markets, the supply of coal, and the promotion of commerce with her neighbors. Austria, however, could not plead her financial condition, as Germany had done, as an excuse for release from the obligations of the Treaty. In its financial administration the government had shown itself inert. It had not, for example, reduced the number of its official servants which was excessive. It appeared to go on the same principle as the government at Berlin, that is to say, to fold its arms and let the conquerors take what action they might to get the money due them. On July 19th, the President of the Council had said Austria was waiting for the gentlemen of the Reparations Committee to aid her as they had promised. This attitude was followed by the vote of the Assembly above-mentioned which was plainly the result of Pan-German politics. The Allies had been negligent in this matter. They had not made it plain that Austria could not escape the obligations of the Treaty. They had not sufficiently warned her Slav neighbors in the newly made states of the danger involved in a united Germany and Austria and they had not held Germany to strict account in respect to article 88 of the Treaty of Saint-Germain which had condemned any such undertaking as the union of Germany and Austria. By articles 80 to 118 inclusive of the Treaty, Germany was required to respect the independence of Austria at the frontiers fixed by the Treaty and to recognize the permanence of this independence, except with the consent of the Council of the League of Nations. Now, according to article 5 of the Covenant, that consent must be unanimous, so the

refusal of France would prevent the union of Germany and Austria. Any infraction of the treaty entitled the Allies to occupy the right bank of the Rhine. Hence, from the moment that Austria should unite with Germany, the French would be authorized to hold the Rhine.

The Austrian National Assembly on October 1st asked the government to resort to a plebiscite on the question of the union of Austria with Germany. There were two main currents of political opinion on this subject: The Pan-Germanists favored union with Germany while another group recommended union with Bavaria with a view to forming a great Catholic state in the heart of Europe. Both these groups wished Austria to emerge from her isolation, but there were numerous elements that desired neither the one nor the other of these solutions. After the conclusion of the Treaty of Saint Germain, Austria, being reduced to a little state without great resources, was believed by many to be destined to attach herself to the territory of her great neighbor, but the question arose whether union with Bavaria might not be better. On September 12th, Dr. Renner in an address at Salzburg highly praised the Pan-German party, thus indicating that the existing Austrian government favored the German solution. The proposal of a plebiscite was in the interest of the Pan-Germans, for it was simply upon the question of the attachment of Austria to Germany that the people were to decide and union with Bavaria was not offered as an alternative. From the point of view of the Allies, and especially France, the union either with Germany or Bavaria was objectionable, since it would build up a strong Germanic power and it was argued that both these solutions would come to the same thing in the end. Reports in the press indicated that France while not intending to interfere for the purpose of preventing the plebiscite, did intend to take serious measures to prevent a union that was unfavorable to the principles of the Treaty. In Austria a union between the Socialist parties and the Christian Socialists had prevented the triumph of the disorderly or Spartacide element. This union, however, was a mere alliance and had no solid organization and in the coming elections the choice between the Socialists and the Christian Socialists was to come before the people. Now it appeared that even the Socialists favored attachment to Germany. This was explained by the belief of the Socialists that they would be more likely to realize their theories in a union with industrial Germany than if Austria remained a little isolated agricultural state, for the peasantry in general had no faith in Socialism. The Christian Socialists on the other hand believed that a union with Bavaria which after its Bolshevik experiment of 1919 had become a conservative state, veering, however, toward monarchy, would protect the country from radical Socialist policies. A third element of some importance in effect though not numerically was the monarchist group which worked for the restoration of the old system and desired a union with Germany under any form. An organ of this party displayed a map of the "Empire of Central Europe" and pointed out that this new empire would include North Germany under the Hohenzollerns, a Germany of the West and South under the Wittelsbach or Bavarian dynasty, and Austria consisting of the Southern and Eastern

provinces of the old monarchy, Hungary within its limits of 1914, the Kingdom of Poland within the limits corresponding roughly to those of the old Grand-Duchy of Warsaw, and a federated kingdom of Croatia, Slovenia, Trieste and its environs, with Bosnia and the Herzegovina; the whole to be under the sovereignty of the emperor of Austria who would possess sovereign rights also over an eastern federation including the Kingdom of Ukraine, along with the largest part of Galicia, a Kingdom of Rumania within its 1914 limits along with Bessarabia, and a Serbo-Bulgarian Kingdom. These dreams which attracted little attention in the English-speaking press were made much of by the French in accordance with the policy pursued steadily throughout the year of emphasizing the German peril.

On the first anniversary of the Treaty a demonstration took place in Vienna in favor of union with Germany and on that occasion a Vienna journal made the following remarks. "Yesterday's demonstrations must not be ignored by the parties who are directing the Entente. In signing the peace Dr. Renner expressed the general Austrian opinion when he said it was a grievous peace but a peace nevertheless. It was possible to entertain at that time certain illusions but the experience of the last 12 months had shattered them. No doubt now remains as to the impossibility of continuing to live under the terms of a treaty which has deprived Austria of her rights and cut her communications with the sea. The Austrian population will never consider the Treaty of Saint Germain as a political status governing all her future destiny."

POLITICAL DIFFICULTIES. On June 11th, the Ministry resigned in consequence of the opposition of the Left which accused the Christian Socialist government of violating its pledge in the matter of certain promised legislation, but the immediate occasion of the crisis was the firing of the gendarmes at Epatz on a crowd which was making a demonstration against profiteering in food. A number of persons were killed and it was alleged against the government that it tried to prevent an investigation and the punishment of the soldiers. There was difficulty also at this time as a result of the Bavarian movement in the Province of Salzburg, Tirol, and parts of Upper Austria, which had for its aim the setting up of a government kingdom along with Bavaria under the Bavarian Prince Rupprecht. In the summer uprisings on the parts of the monarchists were threatened and the country was further disturbed by demonstrations against the Jews. The draft of a new constitution was worked out in the course of the summer.

THE ELECTIONS. As a result of the elections on October 17th, the supporters of order and moderation represented especially by the Christian Socialists obtained a clear victory. The figures as published in the press in November were as follows: Christian Socialists, 82, as compared with 63 in the former chamber; Social Democrats, 66 as compared with 69; Pan-Germans, 20 as compared with 34; Peasants' League, 6; Bourgeois party, 1. Thus both Social Democrats and Pan-Germans lost a number of seats and in the case of the latter the defeat was more noteworthy in view of the vigor of their electoral campaign and their large fund for propaganda. As the above figures show, the Social Democrats fell from first to second place.

There was disagreement between the Christian Socialists and the Pan-Germans in respect to foreign policy, the former being hostile to the Pan-German programme for union with Germany; but an agreement was reached whereby the Christian Socialists were able to form a ministry of which the majority consisted of non-political experts. The Pan-Germans refused to take part in the government and reserved their freedom of action, saying they had consented to this compromise merely in order to insure a majority. The cabinet was constituted as follows: Federal Chancellor and Foreign Minister, Dr. Michael Mayr; Interior and Defense, Dr. Egon Glanz (expert); Education, Walter Breisky (expert); Finance, Dr. Ferdinand Grimm (expert); Food Supply, Dr. Alfred Grunberger (expert); Justice, Dr. Rudolf Paltauf (expert); Commerce, Eduard Heini; Agriculture, Alois Hauers; and Public Welfare, Dr. Joseph Resch.

On December 9th, Dr. Michael Hainisch was elected President by the National Assembly after three days of balloting, and as the result of a combination of Pan-Germans and Christian Socialists. The new President who was well known as a Socialist writer was elected a member of the Austrian Parliament in 1909. He was born in 1858, and was educated in the universities of Vienna, Leipzig and Berlin.

THE KLAGENFURT REGION. Under the treaty with Austria the people inhabiting the Klagenfurt region of Lower Austria were to decide by plebiscite whether to remain under Austrian rule or to join Jugo-Slavia. This district has an area of about 800 square miles and extends some 40 miles along the frontier between Austria and Jugo-Slavia, adjoining the Province of Carinthia. It contains the important manufacturing town of Klagenfurt. Formerly its population was almost wholly Slav, but in modern times the government colonized it with Germans and gradually the Slav population disappeared. The vote which was taken on October 10th gave 221,852 for Austria against 15,096 for Jugo-Slavia. The latter was discontented with the result and certain officers of the army declared that they would not recognize it. Their troops occupied some of the towns in the southern zone.

ECONOMIC DISTRESS. The efforts of the authorities to secure coal and other supplies continued throughout the winter of 1919-20. Unsuccessful efforts to obtain coal from the Czechs and to secure new loans in France were made in February by the Chancellor and his Minister of Finance. The arrival of 93 carloads of supplies in April afforded temporary relief. Prices continued to go up on account of depreciation of the currency and in April a quart of milk cost about \$3 in American money. A troublesome condition prevailed on account of the practice of adulteration, and in spite of severe penalties there were thousands of court cases pending in March for that offense.

At the end of 1920 the Austrian authorities declared that if provisions could not be promptly secured, public disorder would be likely to result. The scarcity was reported to be extreme. The country produced only a small part of its necessary foodstuffs and the government lacked the funds for purchases abroad. It was officially estimated that \$45,000,000 were required for the period, Sept. 1, 1920, to June 30, 1921, exclusive of the cereal products necessary for the industries (estimated at \$11,000,000). The

government had been obliged to centralize the trade in food, and carry it on under its direction. As a result, the Austrian budget for the ensuing year showed a large deficit, estimated at 20,000,000,000 crowns. As to the rate of exchange at the close of the year, the pound sterling, which before the war stood at 24 crowns stood at the end of December at 2000 crowns. Inasmuch as according to the estimates the indispensable purchase of foodstuffs to last until June, 1921, amounted to £32,500,000, Austria would have to send abroad 32,500,000,000 crowns, which would bring the budget deficit to about 20,000,000,000 crowns. Not only were the foodstuffs obtained at an exorbitant price, but they were becoming unobtainable at any price and the country was threatened with a condition that approached famine. Unless long-term credits could be afforded, the distress would become extremely acute. The press of the Allied countries generally favored coming to the assistance of Austria.

AUTHORS' LEAGUE OF AMERICA. This is an association of authors for mutual assistance in the many technicalities involved in publishing and copyrighting, and it supplies confidential information to members in regard to managers, producers, etc. The total membership of the League in 1920 was 1542. The Screen Writers' Guild had 150 members; the Dramatists' Guild had 110 members; and the Guild of Free Lance Artists had 165 members. The Authors' League Fund is a charitable organization to help needy authors, artists, dramatists, or composers. The annual meeting of the League is held on the second Tuesday of April of each year. The constitution of the League was amended at a special meeting held last spring in regard to membership, the amount of dues, and the formation of guilds. Only persons of recognized standing in the literary or artistic professions are eligible to membership in the League. The following were the officers for 1920: The League: President, Rex Beach; vice-president, Booth Tarkington; secretary-treasurer, Eric Schuler. The Dramatists' Guild: President, Owen Davis; secretary-treasurer, Jerome Kern. The Guild of Free Lance Artists: President, C. B. Falls; secretary-treasurer, F. G. Cooper. The Screen Writers' Guild: President, Thompson Buchanan; secretary, Jack Cunningham. Headquarters are maintained at 41 Union Square, West, New York City, and Louise M. Silcox is managing secretary.

AUTOMOBILES. The extraordinary growth of the manufacture and use of the motor vehicle in the United States continued during 1920. During the year, however, financial conditions made themselves felt in the industry and attempts were made to adjust it to new and threatening conditions attendant on the process of deflation and the abated prosperity in many lines. In some cases it was difficult to finance manufacture and in others there were readjustments of prices to meet changed conditions. Toward the end of the year certain plants shut down or arranged to curtail their output, while the tire industry was seriously affected, many manufacturers all but shutting down. See RUBBER INDUSTRY.

It must be remembered that few industries had developed more rapidly in the United States than those having to do with the manufacture and maintenance of automobile vehicles. In

1899 there were 3700 cars manufactured and put in service in the United States; in 1919 there were 1,974,016 manufactured and 117 imported and 82,730 exported. By the end of that year the total number manufactured had reached 9,453,686, the imports 9109, and those exported 426,504. Considering the cars in service by the number of registrations it would seem that in 1919 there were in use 7,558,848 cars, and that up to the end of that year there had gone to the scrap heap 1,677,443 cars; the contribution for 1919 being 489,172. In 1920, the *Scientific American* which compiled the foregoing figures from various authoritative sources, estimated the total manufactures for the year at 2,350,000, the imports at 200, exports at 100,000. The total number of cars manufactured to the end of 1920 was in excess of 12,000,000 of which over 500,000 had been exported. During 1920 there were in service according to registration statistics some 9,000,000 cars, practically 2,500,000 cars having been eliminated since 1900, with 809,048 as the estimate for 1920.

MOTOR TRUCKS IN THE UNITED STATES. Statistics based on reports of secretaries of state and estimates made by statisticians of one of the largest tire manufacturing companies, indicated that there were 953,093 motor trucks in operation in the United States at the end of 1919. The 1919 figures represented an increase of 37 per cent over the estimate of 700,000 trucks in operation at the end of 1918. No exact figures are possible inasmuch as only 18 States of the 48 keep separate registration lists for motor trucks.

The following is the estimate by States: Alabama, 10,249; Arizona, 3200; Arkansas, 5600; California, 58,700; Colorado, 13,500; Connecticut, 19,799; Delaware, 2100; Florida, 3239; Georgia, 9300; Idaho, 5600; Illinois, 65,000; Indiana, 36,000; Iowa, 42,500; Kansas, 27,800; Kentucky, 9105; Louisiana, 7100; Maine, 5792; Maryland, 10,160; Massachusetts, 42,000; Michigan, 36,863; Minnesota, 34,300; Mississippi, 6350; Missouri, 25,000; Montana, 1000; Nebraska, 27,300; Nevada, 700; New Hampshire, 3902; New Jersey, 20,000; New Mexico, 2810; New York, 94,716; North Carolina, 9150; North Dakota, 1314; Ohio, 64,500; Oklahoma, 20,100; Oregon, 11,300; Pennsylvania, 64,200; Rhode Island, 7000; South Carolina, 9600; South Dakota, 14,205; Tennessee, 12,000; Texas, 42,250; Utah, 5300; Vermont, 2402; Virginia, 11,800; Washington, 23,600; West Virginia, 6700; Wisconsin, 10,887; Wyoming, 2900.

Naturally the use of passenger vehicles in the United States in 1920 was practically universal but statistics compiled for the City of New York showed that 420,000 persons traveled back and forth to New York City daily by automobile. This figure did not include those using autos within the city borders. Motor trucks to the number of 7482 traveled on 15 ferries in 24 consecutive hours. Bridge traffic also was heavy, especially at certain hours, as many as 1344 vehicles having been counted in an hour. The number of cars and trucks entering and leaving the city daily was placed at 154,700. The average number of passengers per car is 2.7, while the average load per trucks was 1.14 tons. Of course what is true for New York holds good in proportion for practically every large city in the United States and the figures cited above may be considered as typical.

DESIGN OF PASSENGER CARS. During 1920

there were few startling or important changes in the design of passenger motor cars and in general so satisfactory were the leading types that the models brought out for the following year showed but very slight modifications. In fact in 1920 motor car design had reached a point where there was but slight difference in the body lines of the different makes, most of which conformed to fixed types, leaving to special and individual designs such departures as purchasers with unusual means required. For the open cars a low, rakish body was the approved practice, while the stock closed cars were reduced to a small number of standard types. However, automobile designers were not slow to read the signs of the time and to provide lighter cars and incorporate devices leading to economies of operation. In this connection there was also to be considered the increased cost and lower grades of fuel. This was true in the case of European designs and light cars were arousing increased interest across the Atlantic, even when there was no substantial saving in price.

Passing, however, beyond the general appearance of the cars and considering their power plants more diversity was to be noted. In 1920 the greatest number of cars probably were fitted with four-cylinder engines while the six-cylinder engine was used by the largest number of manufacturers. The eight-cylinder engine continued to show change and improvement, both in the V or twin four arrangement of cylinders, and in that where all eight cylinders were grouped in one line. The leading innovation in the V engine grouping was to set the two sets of cylinders at an angle of 60 degrees, as had been done with some success on a number of airplane motors, in place of the previous arrangement of 90 degrees. In the best designed engines little vibration was experienced notwithstanding that the intervening periods between explosions were not equal as when the cylinders were set at 90 degrees.

The long eight-cylinder all-in-a-line engine had been employed in racing cars and while it involved either small cylinders or a long power plant, nevertheless it was installed in a number of high-grade expensive European cars. By 1920 in practically all types of engine the detachable head was adopted as standard practice, so that with cylinders cast together in one unit access could be made to the interior of each cylinder without an elaborate taking down process. In 1920 low-grade and high-cost fuel resulted in various attempts to improve the vaporization of low-grade fuel. One instance was a device at the inlet manifold where a small amount of fuel was burnt so as to provide for the full vaporization of the remainder. This so-called "fuelizer" was found useful in starting an engine in cold weather and operated by igniting the fuel supply heating system through the agency of a spark plug when the starting switch is turned. In a number of cars heated intake manifolds are to be found, formed either by coring for fresh gas distribution passages surrounded by water, or even by the use of water-jacketed manifolds or those in proximity to the manifolds through which the hot products of combustion in the cylinders are expelled.

One innovation of the year was to provide brakes for all four wheels, small hydraulic cylinders energizing the brake bands to act against the brake drum. There is a central pressure

cylinder in the middle of the chassis from which oil leads of flexible tubing extend to the brake cylinders at each of the four wheels. Pressure with the foot on the brake pedal acts on the central cylinder and piston and the action was claimed to be positive, quick, and direct at each wheel. The device was derived from the familiar C-C or Constantinesco gear used to operate the machine-gun triggers of the airplane armament during the war.

AUTOMOBILE ACCIDENTS. The Bureau of the Census at Washington reported that each year the death rates from automobile accidents were higher than the rates of the previous year. Each year it becomes more and more dangerous for a person to walk the streets. The reason usually given, and probably the correct one, is that the number of automobiles in use is constantly increasing. How then shall this ever increasing danger be lessened? The obvious remedy is to

U. S. AUTOMOBILE FATALITIES

† Transcripts not received.

improve constantly the traffic regulations to keep pace with the increasing number of automobiles.

This call for better and better traffic regulations is not a fanciful one and to be considered only for the largest cities. The well-known comparison was made with the necessity for slow and orderly progress when a crowd emerges from a circus tent and, similarly, automobile traffic must be slowed down and controlled until it becomes safe.

The 1919 rates for Kansas City, Mo., San Antonio, and Cleveland—all much lower than for 1918—furnish a ray of hope that American cities finally are appreciating the importance of the matter.

The following were a few suggestions for traffic improvement advanced by the Census Bureau:

1. At street crossings the erection of curbed safety islands, which, at the most dangerous spots should be very close together.

2. Construction of additional crossings in the middle of blocks, where automobiles can approach from only two directions.

3. Demonstration of great skill in driving each machine before granting a driver's license for that machine.

4. Reduction of the speed limit, especially at crossings.

5. Fine, revoking of license, and imprisonment, each to have its place as an actual penalty.

The tendency of some writers to exonerate automobile drivers and to place the blame of accidents upon pedestrians was also referred to as indicating a lack of a full comprehension of the problems involved.

The preaching of more caution to careless and aged people and children will never be sufficient. They must be protected by additional safeguards, and city governments which will continue to make their traffic regulations more and more rigid till they can point to low death rates from automobile accidents will deserve the commendation of all thoughtful people.

BRITISH MOTOR VEHICLE TAXES. The new automobile and motor truck taxes which had been under discussion in Great Britain and which substitute a horse power and weight basis of taxation for the gasoline tax were adopted to become effective Jan. 1, 1921.

All motor-spirit duties were done away with and the revenue was to be raised solely by vehicle taxes. Motor cycles were given an arbitrary rating; passenger cars were to be assessed £1 per unit of horse power; motor buses on seating capacity, ranging from £15 for five-seated vehicles to £84 for those seating more than 32, while motor trucks, tractors, and road locomotives would be assessed as follows:

<i>Motor Trucks</i>	
Not exceeding 12 cwt. unladen weight	£10
Exceeding 12 cwt. but not exceeding 1 ton unladen weight	16
Exceeding 1 ton, but not exceeding 2 tons unladen weight	21
Exceeding 2 tons, but not exceeding 3 tons unladen weight	25
Exceeding 3 tons, but not exceeding 4 tons unladen weight	28
Over 4 tons unladen weight	30
Any of the foregoing with the right to draw trailer	(additional) 2

Notes:

(1) In ascertaining the unladen weight of electrically propelled vehicles, the weight of the accumulators is to be excluded.

(2) Quarterly licenses to be permitted on payment of 20 per cent above one-fourth of the annual duty.

Other Commercial and Agricultural Vehicles

*Motor tractors (classed as heavy motor cars).... £21

*†Road locomotives and agricultural engines:

Not exceeding 8 tons unladen weight..... 25

Exceeding 8 tons, but not exceeding 12 tons unladen weight..... 28

Exceeding 12 tons unladen weight..... 30

*†Agricultural tractors used on roads for haulage solely in connection with agriculture;

Exceeding 2½ tons, but not exceeding 5 tons unladen weight..... 6

Exceeding 5 tons..... 10

A "tractor" means a mechanically or electrically propelled engine which draws but does not itself carry any load except such as is necessary for its propulsion and equipment.

Quarterly licenses to be permitted on payment of 20 per cent, above one-fourth, of the annual duty except in respect of vehicles only liable to duty at 5s.

* Inclusive of the legally permitted trailers.

† Locomotive plowing engines, agricultural tractors not exceeding 5 tons unladen weight, or other agricultural engines drawing necessary gear, threshing appliances, farming implements or supplies of fuel or water, shall pay a duty of 5s. per annum only, if not used on roads for other haulage work.

The taxes here enumerated were considered very drastic even in Great Britain but were required by the road upkeep and for other considerations. In the case of the taxes on motor trucks it was believed that the increased costs could be passed along to the shipper or consumer. A committee in charge of recommending the law studied in detail the effect of the new taxes on privately owned passenger cars. While the new taxes were heavy it was shown that if both the former vehicle and gasoline taxes were considered practically, all cars which are run 10,000 miles or more per annum would carry a lower tax under the new scale. If run only 5000 miles per annum, the 22 horse power car would be taxed about \$30 a year more than before. The 35 horse power car would pay \$65 a year more, while the 60 horse power car would pay \$120 per year more. For runs of only 2500 miles per year the excess of the proposed over the former taxes would be very much greater, amounting for the 35 horse power car to about \$90 per annum.

MOTOR CAR PRODUCTION IN 1920. The year 1920 marked a record in the production of motor vehicles and the figures given below, compiled by the National Automobile Chamber of Commerce, show the total number of passenger cars and trucks made by American manufacturers in 1920 and 1919, the product of the latter year exceeding by 265,000 the number turned out in 1919. See CITY PLANNING.

Cars and trucks produced in 1920	2,241,000
Total production in 1919	1,974,016
Passenger cars produced in 1920	1,906,000
Production in 1919	1,657,662
Motor trucks produced in 1920	335,000
Production in 1919	316,364
Wholesale value of cars and trucks produced	\$2,136,183,676
Wholesale value of passenger cars produced	\$1,703,437,213
Wholesale value of motor trucks produced	\$432,746,463
Average wholesale price of passenger cars produced	\$897
Average wholesale price of motor trucks produced	\$1,273
Motor truck manufacturers in production	170
Passenger car manufacturers in production	90
States in which factories are located	32
Employees engaged in car and truck manufacture	300,000
Automobile tires manufactured	32,400,000
Increase in gasoline production over 1919	19%

RACING EVENTS. Few new racing records were established during 1920. The driver to attain the most fame was Gaston Chevrolet who won the 500-mile event on the Indianapolis Speedway in May. His time was 5 hours, 38 minutes, 32 seconds. Chevrolet (q.v.) lost his life in an automobile race held late in the summer. The winners of the principal racing fixtures of the year were: Los Angeles, 250 miles, J. Murphy; Indianapolis, 500 miles, Gaston Chevrolet; Uniontown, 225 miles, Tommy Milton; Tacoma, 223 miles, Tommy Milton; Elgin, 251 miles, Ralph de Palma; Fresno, 200 miles, J. Murphy.

AVERY, SAMUEL P. See PAINTING AND SCULPTURE.

AVIATION. See AERONAUTICS.

AZERBAIJAN. A territory of Trans-Caucasia which as constituted in 1920 consisted mainly of the former Russian provinces of Baku and Yelisavetpol; with the Caspian Sea on the east, Georgia, on the north, Caucasus and Daghestan on the north, Georgia and Armenia on the west and Persia on the south; with an area given at about 40,000 square miles, but with claims for additional territory which would bring the area to about 58,000 square miles. The population was roughly estimated on the basis of Russian statistics at 4,615,000, of which 3,482,000 were Moslems and 795,000 Armenians, the racial stock of the majority being Turks and Tartars. Capital, Baku, the centre of the petroleum industry, with a population of about 250,000. Besides petroleum, which is the main industry, there are resources of cotton, silk, wine, and cereals. Cattle-raising and fishing are among the other industries. Railways traverse the country from Baku to the west and north and lines are under construction to the south-west. In 1919 the revenue was given at 665,000,000 rubles and balanced the estimated expenditure. Along with Georgia and Armenia it formed a federation of republics in October, 1917, but this was dissolved and Azerbaijan declared its independence May 28, 1918. A government of 12 Ministers was created by the Constituent Assembly which was then formed and a Parliament of 120 members was subsequently elected. The new government recognized its responsibility for a portion of the Russian debt. Its status as a *de facto* government was recognized by Great Britain in January, 1920. Although at its beginning it opposed the Bolsheviks, the majority were later won over to the Bolshevik cause and in April, 1920, the so-called Unionist party defeated their opponents known as the Equality party and formed a government which was said to be completely dominated by the Soviet government of Russia. There were many reports of persecutions on the part of the Bolshevik authorities and of the direct interference of Soviet representatives in the affairs of the state. In the autumn a Russian extraordinary committee was said to be proceeding with great severity against the opponents of the government. The former representatives at the Peace Conference, who were now in the opposition, sent a protest to the American ambassador in Paris early in September against the inference in the letter of the American Secretary of State to the Italian ambassador that the principle of self-determination did not justify the independence of Azerbaijan. A Communist congress was held at Baku, September 3, under the Soviet official, M. Zinoviev,

which passed resolutions against the Entente Powers. It was the scene of many spectacular demonstrations against the Allies, including the burning of President Wilson and the French Prime Minister in effigy. The Prime Minister at this time was Dr. Narimanov, who also held the portfolio of foreign affairs.

BABTIE, Sir WILLIAM. British army surgeon, with the rank of surgeon-general, died in Belgium, September 11. He was born May 7, 1859, and educated at the University of Glasgow, entering the army medical service in 1881. He served in Crete 1897-98 and in South Africa during the Boer War, where he was present at a number of important actions and won the Victoria Cross for gallantry in attending the wounded under fire at Colenso. He was director of the medical service in India in 1914-15, and in the report on Mesopotamia he was sharply criticized but it was afterwards held that the charges were not of a nature to preclude his further service and he was appointed medical inspector at the War Office.

BACON, ALEXANDER SAMUEL. Lawyer, died at Brooklyn, N. Y., May 29. He was born at Jackson, Mich., Nov. 20, 1853, and graduated at West Point. Having been admitted to the bar in 1879, he practiced law in this country and abroad during many years, and at the same time wrote and lectured extensively. Among his writings were the *Woolly Horse*; *The Illegal Trial of Christ*; *Masonic Nobility*; *Mohammed and Islam*; and *Ancient Cplendars*.

BACON, KATHERINE. See MUSIC, Artists, Instrumentalists.

BADEN. Former grand duchy of the German Empire; after November, 1918, a Republic in the new German state; bounded by Bavaria on the east and the Palatinate and Alsace-Lorraine on the west; with an area of 5819 square miles and a population, in 1910, of 2,142,833, estimated in 1914 at 2,229,100; capital, Karlsruhe (population in 1910, 134,411); largest city, Mannheim (206,049). Instruction is compulsory and free, the elementary schools being supported by the communes or the state. No later statistics were available than those given in the preceding YEAR BOOK for 1912-13, when there were 6075 teachers and 351,008 pupils. The secondary educational institutions include 17 gymnasia, 50 real schools, 12 high schools for girls, 12 training colleges for teachers, one commercial high school and many technical and special schools. There are two universities, one at Heidelberg and one at Freiburg and there is an Academy of Arts at Karlsruhe. It was estimated that 56 per cent of the total area was under cultivation and 39 per cent was forest. The crops included wheat, barley, rye, potatoes, wine, tobacco, etc. The chief mineral products are salt and building stone. In 1918, there were 26,414 acres under vines which yielded 7,887,000 gallons of wine. The chief manufactures are tiles, jewelry, cigars, machinery, clocks, musical instruments, chemicals, cotton tissues, silk ribbons, hats, paper and cardboard, leather, woodwork, brushes, etc.

The revenue and expenditure for 1919 was reported at £13,937,308 and £13,839,898 respectively. In the former grand duchy, the executive power was vested in the Grand Duke and the legislative in the Landtag or Representative Assembly, consisting of two houses. The Grand Duke abdicated Nov. 22, 1918, and Baden was

proclaimed a Republic under a provisional government. On Jan. 15, 1919 a National Assembly began work on the new Constitution, having been elected on the basis of equal, secret, direct, and universal suffrage for all persons over the age of 20. The Constitution was proclaimed March 21, 1919. It abolished all privileges of birth, religion, and caste; bestowed on women the same rights as men and made them eligible for public office; gave the right of forming unions to all employees including civil servants; bestowed suffrage on all persons, male or female, over 21 years of age; and adopted the initiative and referendum as well as proportional representation. The executive was vested in a cabinet of seven Ministers and six State Counselors or Ministers without portfolio and legislative power in a Landtag consisting of a single chamber which has the right to nominate the President of the cabinet. The cabinet as reconstituted in April was as follows: State President and Minister of Military Affairs, Anton Geiss (Socialist); Minister of Foreign Affairs, H. Dietrich (Democrat); Minister of Social affairs and Public Works, L. Rückert (Socialist); Minister of the Interior, A. Remmele (Socialist); Minister of Finance, Dr. P. Köbler (Centre); Minister of Justice, G. Trunk (Centre); and Minister of Education, H. Hummel (Democrat).

BAHAMAS. A group of West Indian islands, 29 in number, together with 661 small islets and over 3000 reefs, off the southeast coast of Florida constituting the northern part of the British West Indian colonies. They are of coral formation and about 20 of them are inhabited. Area, 4404 square miles; population, estimated, Jan. 1, 1918, at 59,928, of whom from 75 to 90 per cent were colored. The principal islands as to population in 1911 were as follows: New Providence (13,554), containing the capital, Nassau; Andros (7545); Eleuthera (6533); Abaco (4463); Exuma (3465); Long Island (4150); Grand Bahama (1824); St. Salvador (5072); Acklins Island (1733); Crooked Island (1541); Harbor Island (1031); Great Inagua (1343); Watling's Island (617); Mayaguana (358). In 1918 there were 50 government schools with 7360 pupils and 12 aided schools with 822 pupils. There were 23 Church of England schools with 1089 pupils, and a small number of private schools. The following information was supplied by the United States Bureau of Foreign and Domestic Commerce in 1920: "The people, many of whom are illiterate, live under primitive conditions. There are no manufacturing industries. The principal field product is sisal, the chief marine product, sponges. Early tomato growing for the American winter market is an infant industry, promising, but not yet organized as to grading, packing, or transport. Subtropical and citrus fruits, coconuts, and avocado pears are grown in limited quantities and locally consumed. No wheat and little corn are produced and nearly all food, with the exception of fresh beef and mutton, is imported from the United States. There is said to be a revival of the salt-gathering industry at Inagua Island, and there is a promise of experiment with sea-island cotton on New Providence. There is some cutting of pine timber on Abaco Island for the Cuban market, and a small cannery for pine-apples on the island of New Providence." The chief imports in 1918 were cotton, linen, and woolen goods, sugar, hominy, rice, lard, butter,

etc., and tobacco, oil, and meat. The chief exports were sisal, sponges, salt, etc. The imports in 1919 were \$2,630,455 as compared with \$1,834,973 in the preceding year, and the exports in 1919 were \$1,864,096 and \$1,356,915 in 1918. Over four-fifths of the trade has been with the United States. The revenue in 1918 was £81,049; the expenditures, £98,237.

BAILEY, CLARENCE MITCHELL. Brigadier-General, died May 21. He was born in New York City, Nov. 26, 1841, and after the outbreak of the Civil War was second-lieutenant in the Sixth United States infantry. He was made captain in 1866 and colonel during the Spanish-American War. He retired for disability in the line of duty, May 5, 1899, and was advanced to the rank of brigadier-general and retired April 23, 1904.

BAKER, HORACE. Railroad official, died April 13. He was born in Missouri and after holding subordinate positions from 1878 to 1885, was made treasurer and paymaster of the Havana, Rantoul and Eastern Railway. In 1902-04 he was assistant general superintendent of the eastern district of the Southern Railway and from 1906 to 1917 he was general manager of the Cincinnati, New Orleans, and Texas Pacific Railway, and the Alabama Great Southern Railway. After Jan. 17, 1917, he was general manager of the Southern Railway system.

BAKER, JAMES. British traveler and author, died June 24. He was born Jan. 1, 1847, and in his youth made extensive voyages including Greece, Russia, Lapland, Egypt, and other countries, and made a special study of Bohemia. He became correspondent for the *Pall Mall Gazette* and other papers and lectured extensively on foreign countries and other subjects. He continued to travel and give lectures for many years and during the war lectured throughout the country on Bohemia and Rumania. Among his various writings may be mentioned: *Pictures from Bohemia* (1894); *The Gleaming Dawn* (1896); *The Cardinal's Page* (1898); *The Unsurpassed* (1905); *Austria* (1912); *Bohemia and Her People* (1917).

BAKER, JOHN GILBERT. British botanist, died August 16. He was born Jan. 13, 1834; became an assistant in the Kew Gardens, Kensington, in 1866, and passed the greater part of his life in that work. He wrote *North Yorkshire; Flora of the English Lake District*; and *Handbook on Fern Allies*, etc.

BALKAN STATES. The states which make up the Balkan peninsula in southeastern Europe and west of the Aegean Sea. See ALBANIA, BULGARIA, GREECE, MONTENEGRO, RUMANIA, SERBIA, TURKEY, etc., and also the article, WAR OF THE NATIONS.

BALLOONS. See AERONAUTICS.

BALTIC PROVINCES. The three former provinces of the Russian Empire in the region of the Baltic Sea, namely, Courland, Livonia, and Esthonia. During the war they were cut off from Russian authority and were under German control. In the autumn of 1919, an Allied commission appointed by the Peace Conference went first to Berlin and then to Riga to arrange for the withdrawal of German troops from the Baltic provinces. By the end of December, 1919, the evacuation was complete. After the war Courland and the southern part of Livonia were included in the new republic of Latvia (q.v.), and the northern part of Livonia was included

in the new republic of Esthonia (q.v.). In 1920 the new states had been recognized by some of the Powers, but France and the United States were withholding recognition on the ground that they formed an integral part of the territory that should belong to a properly constituted Russian state. See titles of the three former provinces and also WAR OF THE NATIONS.

BALTIMORE COUNTY, MD. See MUNICIPAL GOVERNMENT.

BALTIMORE, MD. See GARBAGE.

BANK CLEARINGS. See FINANCIAL REVIEW.

BANKHEAD, JOHN HOLLIS. Senator, died, March 1. He was born at Moscow, Ala., Sept. 13, 1842, and served with the Federal forces in the Civil War, during which he was wounded three times. In 1865-67 he was a member of the Alabama House of Representatives and from 1887 to 1907 he was a member of Congress. In July, 1907, he was selected senator to succeed Senator Morgan for the term expiring 1913 and he was reelected for the two succeeding terms. He was a prominent member of the committees on public buildings, and rivers and harbors, and the author of the law giving Federal aid to post roads.

BANKS AND BANKING. See FINANCIAL REVIEW.

BAPTISTS. Reports for 1920 for this denomination show in the United States a membership of 7,504,447 as against 7,236,650 shown in the 1919 reports. There were 53,866 churches, 42,121 ordained ministers, and 219,465 baptisms (during the year). The Baptists are divided into three main branches, the Northern Convention, the Southern Convention, and the National Convention (colored). Statistics for the beginning of 1920 show in the Northern branch: 9101 churches, 8346 ordained ministers, 1,285,416 members, 8203 Sunday Schools, with 101,809 officers and teachers, and 951,450 pupils. Statistics for the Southern Convention show: 24,373 churches, 17,308 ordained ministers, 3,023,674 members, 18,894 Sunday Schools, with 127,908 officers and teachers, and 1,698,898 pupils. Statistics for the negro conventions show: 20,151 churches, 17,398 ordained ministers, 2,735,007 members, 16,500 Sunday Schools, with 78,008 officers and teachers, and 822,618 pupils. In the three conferences of Canada there were: 1350 churches, 853 ordained ministers, and 141,800 members. There are a number of foreign-speaking Baptist bodies, including the German, Swedish, Danish, French, Italian, Finnish, Hungarian, Norwegian, Czecho-Slovak, Polish, Rumanian, Portuguese, Russian, and a number of others, each represented by its own general conference. There are several other branches of the Baptists, among which the larger are (statistics of 1919, the latest available): Primitive Baptists, with 2282 organizations, 87,359 members, and 19,423 ministers; the Free Will (colored) with 172 organizations, 14,183 members, and 294 ministers; Free Will, 750 organizations, 54,812 members, 873 ministers; General Baptists, with 518 organizations, 33,427 members, and 589 ministers; and Regular Baptists, with 383 organizations, 20,046 members, and 494 ministers. All these organizations carry on extensive missionary work, so that Baptist missions are found in all parts of the world. This work is conducted by separate boards for the various branches. The denomination maintains

14 theological seminaries and has under its control 101 colleges and universities.

World figures, based upon the British *Baptist Handbook* for 1920, show that in North America there are in this denomination, 55,986 churches, 43,272 ordained ministers, and 7,702,196 members; South America, 832 churches, 212 ordained ministers, and 22,676 members; Europe, 5216 churches, 3588 ordained ministers, and 618,538 members; Asia, 2405 churches, 1747 ordained ministers, and 244,731 members; Africa, 532 churches, 560 ordained ministers, and 24,535 members; and Australasia, 376 churches, 295 ordained ministers, and 31,138 members, or grand totals for the world of 65,347 churches, 49,674 ordained ministers, and 8,643,814 members.

BAPTISTS, FREE. This denomination has ceased to exist as a denomination, having completed its union with the Baptist Church in 1919. All missionary work was taken over by the Northern Baptists.

BAR ASSOCIATION, AMERICAN. An organization having for its purpose the advancement of the science of jurisprudence, the promotion of the administration of justice and uniformity of legislation, and the upholding of the honor of the legal profession. The forty-third annual meeting was held in St. Louis, Mo., Aug. 25, 26, 27, 1920, with President Hampton L. Carson presiding. The meeting opened with an address of welcome by Walter G. Goodson, Acting Governor of Missouri, followed by an address by the President of the Association. After this address he introduced Sir Auckland Geddes, British ambassador to the United States. Mr. Carson spoke on "The Evolution of Representative Constitutional Government," tracing the development of the principles contained in the Constitution, and showing its firm foundation. Sir Auckland Geddes spoke on the problem of the adjustment of man to his environment. A memorial tribute to George Whitelock, the late secretary of the Association, was read. A long discussion, led by Thomas C. McClellan, was held on the subject of expanding the Association. It was brought out that at present there are some 12,000 members, out of 127,000 lawyers in the United States. An address on "The Future of International Law" was given by Viscount Cave, Lord Justice of Appeal for the Dominion of Canada. The reports from the various sections and committees followed. The sixth session of the meeting consisted of a discussion of the general subject of Legal Aid. The following speeches were made: "The Relation Between Legal Aid Work and the Administration of Justice," by R. H. Smith of Massachusetts; "Legal Aid Societies, Their Function and Necessity," by Charles Evans Hughes, of New York; "The Relation of Legal Aid to the Municipality," by E. L. Tustin; and "Justice without Cost for Parent and Child," by Ben B. Lindsey, of Colorado. The Secretary's report showed 11,243 active and 14 honorary members at the date of publication of the 1920 report. Since then there have been 277 deaths and resignations, and 778 new members and 1 honorary member were proposed, all of whom were elected by the executive committee. The Association is affiliated with 38 State Bar Associations. The report of the treasurer showed \$18,773.24 in assets. *The American Bar Association Journal* is the official organ of the organization. The minutes of the annual meeting are published in book form. The officers in

1920 were: President, Hampton L. Carson, Philadelphia, Pa.; secretary, W. Thomas Kemp, Baltimore, Md.; and treasurer, Frederick E. Wadhams, Albany, N. Y. Headquarters are maintained at 901 Maryland Trust Building, Baltimore, Md.

BARBADOS. An island colony of Great Britain, the most westerly of the Caribbean islands, lying to the west of the Windward Islands, with a length of 21 miles and a breadth of 14 miles. Area, 166 square miles; population (1911), 171,982; estimated Dec. 31, 1918, 191,664. Capital and chief city, Bridgetown, with a population (1911) of 16,648. Figures for revenue, expenditure, exports, and imports in pounds sterling are as follows:

1918-1919	
Revenue	347,497
Expenditure	357,817
Imports	2,986,996
Exports	2,480,646

The public debt in 1918-19 was £530,000. The executive power is in a governor with an executive council and executive committee; and the legislative power in a legislative council of nine members and a house of assembly of 24 members elected by the people each year. The Governor, at the beginning of 1920, was Lieut.-Col. C. R. M. O'Brien.

BARBER, OHIO COLUMBUS. Capitalist, died at Akron, Ohio, February 4th; known as "Match" Barber. He was born at Middlebury, Ohio, April 20, 1841, and went to work in his father's match factory, 1856, becoming the head of the firm after his father's death. He consolidated the leading companies into the Diamond Match Company, of which he became the president. He founded in 1891 the town of Barbertown, Ohio, and devoted himself to its development.

BARGE CANAL. See CANAL.

BARLEY. Estimates published by the International Institute of Agriculture, Rome, showed for most European countries some recovery in barley culture in 1920, as compared with 1919. The largest increases in acreage and production over the preceding year were reported for Rumania, Belgium, the United Kingdom, France, Germany, Bulgaria, the Netherlands, Spain, and Greece. For a group of countries of the northern hemisphere representing about 46 per cent of the world's yield, the production for 1920 was placed at 564,777,675 bushels, or 7.2 per cent above the production in 1919 but still 6.1 per cent below their average yield.

The chief barley-producing countries in the northern hemisphere and their yields in 1920, exclusive of the United States, were as follows: Japan 92,022,500 bushels, Germany 88,000,000 bushels, Spain 85,594,500 bushels, Canada 62,946,000 bushels, and England and Wales 50,688,000 bushels. For Russia, which produced about 500,000,000 bushels annually before the war, no data were available. The consumption of barley in normal times is largest in Russia, Germany, the United States, the United Kingdom, and Japan, given in the decreasing order. Barley is preëminently a crop of the northern hemisphere, both production and consumption in the countries south of the equator being comparatively small.

According to estimates by the Department of Agriculture the United States in 1920 produced

202,024,000 bushels on 8,083,000 acres, or at the rate of 25 bushels per acre. These figures represent an increase of 885,000 acres in area and of 40,697,000 bushels in production, and a decrease of 1.1 bushels in the average acre yield. The average price of barley on the farm Dec. 1, 1920, was only 70.7 cents per bushel as against 121 cents Dec. 1, 1919. The increase in acreage and production was not sufficient to offset the decline in price, so that the total value of the crop on this basis was only \$142,931,000 or \$52,368,000 less than the year before.

The principal barley producing States in 1919 were California, South Dakota, Minnesota, Kansas, and North Dakota, which furnished more than half of the country's crop. In California the variety known as Mariout is proving of value by reason of its greater drought resistance and yielding capacity, and its lesser tendency to shatter as compared with the common varieties. As pointed out by the California Agricultural Experiment Station, the heavy losses through shattering due to the use of the combined harvester in harvesting the barley crop can be avoided largely by cutting with the self-binder.

BARNARD COLLEGE. See COLUMBIA UNIVERSITY.

BAROTSELAND. See RHODESIA.

BARRAGE. See DAMS.

BARTHOLOMEW, JOHN GEORGE. British geographer and map-maker, died April 16th. He was born at Edinburgh, Scotland, March 22, 1860, and was educated at Edinburgh University. He was prominent in the important geographical societies and one of the founders of the Royal Scottish Geographical Society, of which he was secretary for many years. Among the various atlases that he issued may be mentioned the *Survey Atlas of Scotland* (1895-1912); *Citizen's Atlas* (1898-1912); and *Atlas of Meteorology* (1899), and atlases of England and Wales, the World's Commerce, Imperial India, Zoography, etc. He was head of the Edinburgh Geographical Institute.

BARTLETT, HOMER NEWTON. American composer and organist, died in Hoboken, N. J., April 3. He was born in Olive, N. Y., Dec. 28, 1845. At the age of 10 he appeared in public as a pianist, but continued his studies until 1861 under S. B. Mills (piano) and O. F. Jacobsen (organ and comp.). Then he filled several positions as organist in New York, the last at the Madison Avenue Baptist Church, where he remained almost 35 years. He was one of the founders of the American Guild of Organists, and served several terms as president of the National Association of Organists and vice-president of the New York Manuscript Society. His compositions number almost 250, the more important being a three-act opera, *La Vallière*; an oratorio, *Samuel*; a symphonic poem, *Apollo*; a cantata, *The Last Chieftain*; a sextet for strings and flute; a violin-concerto in G; a dramatic aria for tenor and orchestra, *Khamzin*; also numerous works for organ and piano.

BASEBALL. The professional baseball season of 1920 in the United States was the most remarkable in the history of the national game. Never before did the various clubs make so much money and never before did so many sensational events in connection with the sport occur. In fact despite the financial success that marked the year baseball almost went "on the rocks" as the result of the scandal that developed

regarding the playing of the world series of 1919 between the Chicago White Sox and the Cincinnati Reds.

As a result of confessions made by certain members of the White Sox team that they had accepted bribes from a gambling combine to "throw" the world series the Chicago grand jury indicted eight of the White Sox and President Comiskey of the Chicago club promptly expelled the accused players from his team. This expulsion took place a few weeks before the close of the season and so crippled the White Sox that they lost what chance they had of winning the American League pennant for the second year in succession.

The players indicted were: Gandil, first baseman; Weaver, third baseman; Jackson, outfielder; Cicotte and Williams, pitchers; Risberg, shortstop; McMullin, substitute infielder; and Felsch, outfielder.

So critical was the situation of organized baseball that the internal troubles of the American League resulting from the opposition on the part of three club-owners to the continued iron-clad rule of Ban Johnson, president of the league, were eventually smoothed over and the American League united with the National League in offering the post of supreme arbiter of the game to Kenesaw Mountain Landis, a Federal judge of Chicago.

Judge Landis finally agreed to accept the position providing he were given complete authority to purge the game in any way he saw fit from the gambling scandals that threatened to wreck the sport and also have the final say in all disputes which might arise from time to time among the owners or players of the two big leagues. The minor leagues joined in the agreement which gave Judge Landis the powers he sought with the result that for the first time in the history of organized baseball a disinterested person has taken the reins.

Another remarkable feature of the year having to do with the playing end of the game was the marvelous batting done by George "Babe" Ruth of the New York American League team. Ruth piled up the enormous total of fifty-four home runs for the season, a figure never before approached.

If baseball of 1920 had its fill of squabbles bearing upon the politics of the game and its many thrills afforded in the playing of Ruth, Sisler of the St. Louis Browns, and others, it also had its tragedy in the death of Ray Chapman, the Cleveland shortstop, who was hit on the head by a pitched ball at the Polo Grounds. This unfortunate accident occurred late in the season just when the Cleveland team was battling for the lead and it seemed to spell the doom of Cleveland's pennant chances.

Under the inspiring leadership of Tris Speaker, however, his men rallied in time to bring the first championship to the Forest City. In addition Cleveland won the world championship by its defeat of the Brooklyn Club, National League pennant winner, Speaker's men capturing five of the seven games played.

The attendance and receipts of the world series of 1920 showed a big falling off from the previous year, a fact that could be partially attributed to the disclosure of the scandal of the 1919 series and partially to the restricted seating capacities of the Brooklyn National League grounds and the Cleveland grounds. The total attendance for

the seven games was 174,349 and the receipts were \$564,800.

The first game of the series was played at Brooklyn, October 5th, Cleveland winning by a score of 3 to 1. The Cleveland battery comprised Coveleskie and O'Neill, while Brooklyn used Marquard, Mamaux and Cadore in the box with Krueger behind the bat. The statistics regarding the other games follow:

October 6th at Brooklyn—Brooklyn 3 runs, 7 hits, 0 errors; Cleveland 0 runs, 7 hits, 1 error. Batteries Grimes and Miller; Bagby, Uhle and O'Neill.

October 7th at Brooklyn—Brooklyn 2 runs, 6 hits, 1 error; Cleveland 1 run, 3 hits, 1 error. Batteries Smith and Miller; Uhle, Caldwell, Mails and O'Neill, Nunamaker.

October 9th at Cleveland—Cleveland 5 runs, 12 hits, 2 errors; Brooklyn 1 run, 3 hits, 1 error. Batteries Coveleskie and O'Neill; Cadore, Mamaux, Marquard and Miller.

October 10th at Cleveland—Cleveland 8 runs, 12 hits, 2 errors; Brooklyn 1 run, 13 hits, 1 error. Batteries Bagby and O'Neill, Thomas; Grimes, Mitchell and Miller, Krueger.

October 11th at Cleveland—Cleveland 1 run, 7 hits, 3 errors; Brooklyn 0 runs, 3 hits, 0 errors. Batteries Mails and O'Neill; Smith and Miller.

October 12th at Cleveland—Cleveland 3 runs, 7 hits, 3 errors; Brooklyn 0 runs, 5 hits, 1 error.

The final standing of the clubs in the American League was: Cleveland won 98, lost 56; Chicago won 96, lost 58; New York won 95, lost 59; St. Louis won 76, lost 77; Boston won 72, lost 81; Washington won 68, lost 84; Detroit won 61, lost 93; Philadelphia won 48, lost 106.

The final standing of the clubs in the National League was: Brooklyn won 93, lost 61; New York won 86, lost 68; Cincinnati won 82, lost 71; Pittsburgh won 79, lost 75; Chicago won 75, lost 79; St. Louis won 75, lost 79; Boston won 62, lost 90; Philadelphia won 62, lost 91.

The pennant winners in the more important minor leagues were:

International, Baltimore; American Association, St. Paul; Southern Association, Little Rock; Pacific Coast, Vernon; Eastern League, New Haven; Western League, Tulsa; Texas League, Fort Worth.

Among the American colleges Georgetown University had the strongest nine, winning seventeen out of twenty games. Holy Cross deserved second place, with Lafayette and Penn State following in the order named.

BASKETBALL. The basketball championship of the Intercollegiate League was won for the third year in succession by the five representing the University of Pennsylvania. The University of Chicago captured the Western Conference title but met defeat in a post-season series with the Pennsylvania quintet.

Probably the strongest amateur basketball team in the United States was the five of New York University which carried off the Amateur Athletic Union championship in a tournament held at Atlanta, Ga. New York University was not a member of the Intercollegiate League but challenged the title-winning Pennsylvania five to a series of post-season games to settle the question of supremacy. The fact that Penn had already arranged to meet Chicago, the Conference champion, made this test impossible.

BASQUE. See PHILOLOGY.

BATES COLLEGE. A non-sectarian institu-

tion of higher education at Lewiston, Maine; founded in 1864. The summer school enrollment was 107. In the fall of 1920, there were 526 students and there were 39 members in the faculty. The productive funds in 1920 were \$1,174,000 and the income \$141,998.07. In 1920 a large gift was offered by the General Education Board, on condition that a certain amount be raised by the college and a gift of \$500,000 was promised by the Northern Baptist Convention, if its efforts to raise a certain sum met with the expected success. President, Rev. Clifton D. Gray, elected Nov. 29, 1919. He began his duties in May, and was inaugurated at the commencement.

BATTERSHALL, WALTON WESLEY. Clergyman, died March 10th. He was born at Troy, N. Y., Jan. 18, 1840, graduated at Yale College, 1864, and at the General Theological Seminary in 1866. He was ordained priest in 1866 in the Protestant Episcopal Church and he was rector at Rochester and Albany, becoming in 1902 archdeacon of Albany. Besides works pertaining to the local history of Albany, he wrote *Interpretations of Life and Religion* (1897).

BATTLE CRUISER. See BATTLESHIPS AND OTHER WAR VESSELS.

BATTLESHIPS AND OTHER WAR VESSELS. The United States and Japan were the only two nations building battleships in 1920 so we must look to their latest designs for evidence of the present trend of naval opinion as regards such vessels. The latest American battleships are to be of 43,200 tons displacement, have a speed of 23 knots, carry 12 16-inch guns, and be protected against torpedoes, plunging fire, and bombs from aircraft, to an extent not hitherto thought possible. The Japanese battleships of the *Negato* type are of 33,800 tons; speed, 23 knots; battery, 8 16-inch guns; protection about the same as in our *Colorado* class (32,600 tons) which they closely resemble in almost every way—displacement, battery, armor, etc. Two other ships supposed to be of this type have been laid down, the *Kaga* and *Tosa*, but there are strong grounds for believing that they are of nearly 40,000 tons and will carry 10 16-inch guns. We thus see that the tendency of battleship building is toward increased size in order to carry large guns and have greater protection against torpedoes and plunging fire at long range. As to the calibre of the battleship gun, we have apparently not yet reached the maximum, as both United States and Japan are building 18-inch guns and will doubtless mount them in future ships. Aside from the increases in size and battery power the most salient feature of new types of battleships is the increase in protection against torpedoes, plunging fire, and aerial bombs. During the war, the ease with which old-type vessels were quickly sunk by a single torpedo was in sharp contrast with the behavior of the later ships, several of which were kept afloat after two torpedo hits, and others kept station in battle after a single hit that would have sent an old-type ship to the bottom. In this respect the German ships behaved better than the British and showed that they had given much thought to submerged protection as well as to armor. The weakness of the German ships was in their batteries. One class of ships carried 11-inch guns and none carried larger guns than the 12-inch and only 10 of these except the *Oldenburg* class which, from

the antiquated method of placing the turrets, could only fire eight guns on each beam. The best of their ships were therefore inferior to our *Wyoming* class as regards battery and very much inferior in nearly every way to the *New York* and *Texas*, which were completed before the war broke out. The German guns had one important advantage, however, they were so mounted as to give a high angle of elevation and a consequent long range and heavy angle of fall very dangerous to weakly armored decks. This high angle of elevation has been embodied in all our recent ships; the 43,200-ton battleships and the battle cruisers having mountings permitting an elevation of 30 degrees.

BATTLE CRUISERS. The battle cruiser is merely a battleship in which a considerable amount of armor protection and some of the guns of the main battery are sacrificed to speed. Whatever the number of the guns that are retained, however, they are to be of the same calibre and power as the main battery guns of existing battleships. The necessity for some ships of this type in every large navy is now generally recognized, though to American ideas the Japanese seem to be overdoing the matter. But, as we have no direct insight as to their exact naval policy, we are not in a position to pass judgment on their views. The battle cruisers of the latest type are enormous vessels, equal in displacement to the largest battleships. In fact, the latest British and Japanese battle cruisers are very much larger than any battleships in either navy.

Of recent battle cruisers, the *Hood*, completed for the British navy in 1920, is one of the most interesting. While generally classed as a battle cruiser she closely approaches battleship specifications. The original plans of the *Hood* were approved by the Admiralty in April, 1916, a few weeks before the battle of Jutland. In view of the damage done to British and German battle cruisers in that action, the original plans were revised, the armor protection increased about 50 per cent, and certain other improvements in protection were embodied. The result was a considerable increase in displacement and draft and a slight decrease ($\frac{1}{2}$ knot) in speed. The principal details of the *Hood* are: Length, 860 feet; beam, 104 feet; mean draft, 28.5 feet; mean displacement, 41,200 tons; speed on trial, 32.1 knots; guns, 8 15-inch (45-cal.), 12 5.5-inch, 4 4-inch (anti-aircraft); armor belt, 12-inch; gun positions, 12 to 15 inch; total weight of armor, 13,800 tons. Torpedo tubes: 2 21-inch submerged; 4 21-inch above water. The underwater protection against torpedoes consists of a "bulge" extending from the bottom (which has no dead rise) to slightly above the water line. This projects 10 or 12 feet beyond the hull proper and is subdivided into water-tight compartments. Monitors and other craft fitted with bulges were, during the war, repeatedly torpedoed without other injury than increase of displacement.

The American battle cruisers of the *Constitution* class are not widely different from the *Hood*. Their principal details are: Length, 850 feet; beam, 101.7 feet; mean draft, 31 feet; displacement, 43,500 tons; main battery, 8 16-inch (50 cal.) guns; secondary battery, 16 6-inch and 4 3-inch (anti-aircraft); 4 submerged torpedo tubes and 4 above-water tubes, all 21-inch; the propelling machinery consists of 4 main genera-

tors and 8 propelling motors (2 on each shaft) of a total horse power of 180,000, designed to give a speed of 33.25 knots. The same "bulge" protection is fitted as in the *Hood*. Nothing definite has been published as to the armor of these ships but the belt is probably not over 10 inches and the gun positions about the same.

The new Japanese battle cruisers are of quite different dimensions to the British and American ships. The principal details are: Length (b.p.), 770 feet; beam, 105 feet; draft, normal, about 29 feet; draft, full load, about 31 feet; normal displacement, 41,000 tons; full load displacement, about 45,000 tons; the main battery consists of 10 16-inch guns; secondary battery, 16 5.5-inch; anti-aircraft, 4 3-inch; horse power, about 120,000 for 30 knots speed.

LIGHT CRUISERS. The same tendency to increasing size is shown in the new light cruisers in all navies. A few years ago such vessels were of 3500 tons or less. To-day they run from 4500 to 10,000 tons. The main cause of increase was, first, speed, then battery power. But the varying conditions of warfare, the increase in sizes of other vessels, the disappearance of the armored cruiser, and the changes in the strategic and tactical uses of the light cruiser have combined to increase its average size. The smaller type which served as destroyer flagships have, moreover, been largely replaced by flotilla leaders of 1800 to 2500 tons. The speed of the larger types of light cruisers (7000-10,000 tons) is usually 31 to 35 knots; of the smaller types, 28 to 32 knots.

DESTROYERS. Concerning that very important and useful naval craft the destroyer, there is little news to record. It was well developed and thoroughly proved and approved during the war. The United States is completing a large number, all provided for before the armistice. Great Britain, France, Japan, Spain, and Italy are building a few. The most popular size for ordinary sea-going destroyers is 1200 to 1300 tons. The great fleet nearly completed by the United States navy are of 1215 tons and have a designed speed of 35 knots that has been exceeded by 2 to 5 knots in most cases. The new Japanese destroyers are of about 1300 tons. The flotilla leader is becoming more and more a fixed and definite institution and is increasing in size. The flotilla leaders asked for in the last United States naval estimates were to be of about 2200 tons and have a speed of 37 knots.

SUBMARINE BOATS. The submarine is still more or less in the experimental stage—or at least in such a development stage that no one can tell exactly in what direction to look for the next success or improvement. All nations agree that it has come to stay and that it will be used against merchant shipping, but not in the German way. If the ship is to be sunk, the sinking is not to take place until the passengers and crew have their safety fully provided for—and this does not mean leaving them in open boats far from shore. In other words, the submarine must effect capture or destruction with the same regard to non-combatant life as was the custom for surface cruisers. Sinking without warning should cause the officer committing the offense to be hung for piracy and murder. The Germans have not been punished for their inhumanity and some other unscrupulous people in a future war are likely to follow in their footsteps.

The future use of submarines as commerce destroyers, mine-layers, and scouts is likely to produce new types specially suitable for the service. Other improvements looking to the safety, habitability, and fighting power of submarines are to be expected from time to time. In 1918, the Germans built boats of about 2200 tons (light-surface condition) and these carried 2 6-inch guns. Proposed submarine battleships were under consideration in Germany and elsewhere. Such vessels were to be of many thousand tons displacement, to carry armor on exposed parts and a battery of considerable power. Apparently we are still a long way from achieving a successful vessel of this type. The cruiser type, designed to operate in a humane way against the enemy's commerce, offers no special difficulties and can easily be brought out as soon as we have solved many problems in regard to submarines in general that are awaiting solution. One of these is higher possible surface speed accompanied by very economical surface cruising speed. Others are improved habitability and greater safety in operating. As at present constructed there are too many chances for accident. Very many accidents are due to lack of automatic stability in a wholly immersed submarine. Considerable trouble is brought about by lack of structural strength and rigidity, internal and external. The margin of safety is thought to be about as high as the available weights will permit—but weaknesses are often shown, and the danger must be obviated.

Submarines designed for normal use against naval vessels of the enemy are of three general types—the fleet type, the cruising type, and the harbor type. The fleet (designed to accompany the battle fleet) must have good surface speed, good habitability, and good offensive power; they must therefore be large—1200 tons or more. Cruising submarines include all those operating independently and are of various sizes (800 to 2000 tons) and possess various characteristics. A displacement of 800 to 1000 tons is commonly regarded as the most practicable, all things considered, but for certain purposes this would have to be greatly increased. The harbor type of submarine is usually 350 to 550 tons, habitability and radius of action being sacrificed.

Nearly all naval powers—even many weak ones—are experimenting with submarines. While the acid tests and enforced pressure of war are no longer behind these experiments, there is reason to believe that much is being learned and that the continued improvement in design is sufficient to afford encouragement.

BAVARIA. Formerly a constituent kingdom in the German Empire, but after November, 1918, a republican state under the new German government. Area, 30,562 square miles; population (1910), 6,962,109, including the Palatinate, whose area is 2372 square miles with a population (1910) of 937,085. To this was added the territory of the free state of Coburg, which decided to unite with Bavaria on Nov. 30, 1919. The Bavarian Diet adopted the bill for union by a unanimous vote March 11, 1920. The chief cities of Bavaria are: Munich, with a population (1910) 596,467, estimated (1914) 639,214; and Nuremberg with a population (1910) of 333,142, estimated (1913) 373,865. According to the census of 1910, the Roman Catholics formed 70.61 per cent of the population. Down to Nov. 11, 1918, the executive power was in

the hands of the kings of the Wittelsbach dynasty whose crown, hereditary, and the legislative power was in a parliament which consisted of an Upper House, comprising the royal prince and other dignitaries and life members appointed by the Crown, and a Lower House consisting of members elected by direct vote. The King down to November, 1918, was Ludwig III, born Jan. 7, 1845. The dynasty was deposed Nov. 22, 1918, and Bavaria was proclaimed a republic. A cabinet under the leadership of Kurt Eisner, a Socialist, took control of the government as noted in the preceding **YEAR BOOK**. Eisner was assassinated in February, 1918, and then for a time there was a struggle between the more moderate groups and the extremists of the Left who sympathized with the Bolsheviks.

In 1918 the chief crops, with their area and their yield in metric terms, were as follows: Wheat, 682,552 acres and 381,716 metric tons; rye, 1,190,875 and 630,796; oats, 1,075,977 and 639,830; potatoes, 741,715 and 2,509,335; vines on 43,522 acres yielded 15,811,620 gallons of wine. The livestock on June 1, 1919, were: Horses, 350,320; cattle, 3,672,801; sheep, 773,065; pigs, 1,106,300; goats, 442,838.

The budget is voted for two years. The ordinary budget for 1919 was: Revenue, 160,113,351 marks; expenditures, 613,829,458 marks. The debt in 1919 was 2,559,077 marks.

The moderate element tended steadily to get the upper hand. Meanwhile work on the constitution was going on and it was completed, Aug. 14, 1919. The new constitution created the free state of Bavaria wherein the people were the source of power. The executive power was vested in the ministry as a whole. The legislative power was in a Diet of one chamber elected for four years in the proportion of one to every 100,000 of the population; in the beginning of 1920 the members numbered 183. The new constitution abolished all privileges of birth and caste, separated the church from the state, and provided that all religious associations should be free in the exercise of worship and should have equal rights. The ministry as constituted on March 7, 1920, was as follows: Prime Minister and Minister of Foreign Affairs, Von Kahr; Education, Matt; Commerce and Industry, Hamm; Social Welfare, Oswald; Agriculture, Wuffelhofer; Finance, Koffler; Justice, Müller. The portfolio of the Interior was at that time held also by the Prime Minister.

The treaty provided for the union of Coburg with Bavaria. This was carried out February 10th, at Munich, by the representatives of the two governments. For an account of the movement in Austria for a union with Bavaria, see **AUSTRIA**, paragraphs on *History*. See also **GERMANY AND WAR OF THE NATIONS**.

BAYLOR UNIVERSITY. An institution of the higher learning, at Waco, Texas, founded in 1845. In the fall of 1920 there were 1209 students enrolled, and in the summer session, 814. There were 50 members in the faculty. The productive funds of the institution amounted to \$642,921.76 and the income for six months to \$20,086.67. There were 40,604 volumes in the library. President, Dr. S. P. Brooks, A.M., LL.D.

BEARD, ADELIA BELLE. Artist, died February 16th. She was born at Painesville, Ohio, and educated in private schools. After studying at Cooper Union and the Art Students League in

New York City, she taught classes in drawing and painting. She was well known as an illustrator for books and magazines, and especially for the illustrations for the books on birds and animals which bore her name.

BEAUX-ARTS INSTITUTE OF DESIGN. This society was incorporated in 1916 to carry on the work previously conducted by the society of Beaux-Arts Architects, run on a system similar to the Ecole des Beaux Arts in Paris. The report of the director of the school shows that for 1920 there was a great increase over 1919 in the number of students and of work done in the Departments of Architecture and of Mural Painting. In the Department of Sculpture there was no change in the number of students, but the work was of much higher grade than in 1919. All the students competing in 1920 in the finals for the Roman Academy scholarship were students of this Institute. The total number of students in the Institute was 1051. The 13th Paris Prize of \$1200 per annum for two and a half years' study in architecture at the Ecole des Beaux Arts in Paris was awarded to Duncan McLachlan. There were 118 original competitors. The Department of Interior Decoration, which was organized but three years ago, reports that it is getting on a firmer foundation and that work is progressing well. The officers of the Institute for 1920 were: Director, Lloyd Warren; chairman of the Board of Trustees, Thomas Hastings; and secretary, William L. Bottomley. Headquarters are at 126 E. 75th St., New York City.

BEAVAN, THOMAS DANIEL. Roman Catholic Bishop, died at Springfield, Mass., October 5. He had been for twenty-eight years head of the Springfield diocese. He was born at Springfield in 1849 and graduated at Holy Cross, Worcester, Mass., 1870; taught at the College of Loyola, Baltimore, in 1870-72; then studied at the College of Montreal, and in 1873 was ordained priest. For the ten years following 1879 he was a pastor at Spencer, Mass., and then for three years was a pastor at Holyoke. He was consecrated Bishop of Springfield, Oct. 18, 1892.

BEEF. See **LIVE STOCK**.

BEER, GEORGE LOUIS. American historian, died March 15th. He was born on Staten Island, New York, July 26, 1872, and graduated at Columbia in 1892. For a number of years he was engaged in the business of an importer of tobacco. He lectured on European history at Columbia in 1893-97. From 1918 to 1919 he was chief of the Colonial Division of the American Commission to negotiate peace in Paris and was then appointed Director of the Mandatory section of the Secretariat of the League of Nations.

BELGIAN CONGO. See **CONGO, BELGIAN**.

BELGIAN RELIEF. See **RELIEF FOR WAR VICTIMS**.

BELGIUM. A kingdom of western Europe situated between France and the Netherlands, overrun and held by the Germans throughout the war but restored to independence in the autumn of 1918. Capital, Brussels.

AREA, POPULATION, ETC. The total area is 11,373 square miles. The population Dec. 31, 1910, was 7,423,784; estimated Dec. 31, 1918, 7,555,576. Of the nine provinces the four having the greatest population are Antwerp, Brabant, East Flanders, and Hainaut. The chief towns with their populations on Dec. 31, 1917, are: Brussels, including suburbs, 679,931; Ant-

werp, 309,516; Liège, 169,790; Ghent, 163,595. In 1910 those who spoke Flemish only numbered 3,220,662; French only, 2,833,344; French and Flemish, 871,288; German only, 31,415. Those who spoke all three languages were 52,547. (See paragraph below, *Malmédy and Eupen*.) The majority of inhabitants are Roman Catholic, but no recent figures are available except for the clergy. In 1919 the higher clergy of the Roman Catholic Church numbered 85; the lower clergy, 5775. There were 3667 Roman Catholic churches in the six dioceses. School statistics are not available for the years following the outbreak of the war. There are four universities, of which those at Liège and Ghent are state institutions and those at Brussels and Louvain are free. The students in 1918-19 numbered, Brussels, 2212; Ghent, 1006; Liège, 2109; Louvain, 2783 (1920). The various special technical schools attached to the universities had 2691 students in 1918-19.

EUPEN AND MALMÉDY. Belgium sovereignty was proclaimed over these regions, January 12th; and on January 22nd, the high commissioner, M. Baltia, issued a proclamation promising religious freedom, the introduction of an educational system like that of Belgium, and the standardization of labor. They were formally annexed to Belgium in September. This was in accordance with the plebiscite held under the Treaty of Versailles and confirmed by the League of Nations. Both districts are of considerable importance. Malmédy has an area of 813 square kilometers and is the centre of the tanning industry and of other important industrial enterprises. Eupen has an area of 180 square kilometers and its industrial population is largely engaged in the textile industry.

PRODUCTION. The following information in respect to agricultural conditions was supplied by the United States Bureau of Foreign and Domestic Commerce in December, 1920:

Belgium is intensively developed agriculturally. Of the entire area of the country—7,275,525 acres—4,382,629 were cultivated in 1913. Figures for 1919 show 298,508 farms, of which approximately 28 per cent were cultivated by their owners. One-seventh of the population was estimated to be working on farms. The devastated region, amounting to but 250,000 acres, lies mostly in West Flanders; and of this it was estimated that 25,000 acres would be cultivated during 1920. According to specialists, agricultural restoration would be completed in two and one-half years.

The following table shows restoration accomplished in principal crops at the end of 1919:

Crops	Area cultivated		Amount produced	
	1913 Acres	1919 Acres	1913 Met. tons ^a	1919 Met. tons
Wheat	394,110	279,243	401,950	269,300
Rye	641,213	496,256	570,595	347,520
Barley	84,095	75,118	91,808	78,750
Sugar beets	129,527	112,183	1,391,917	73,062
Oats	671,856	549,798	696,095	390,750
Potatoes	395,041	319,258	3,200,932	2,070,140

^a The metric ton equals 2,204.6 pounds. ^b Sugar.

To aid agricultural reconstruction a central administrative office of agricultural reconstruction was created. Other measures to this end were: Appointment of experts and agents; special service to farmers of the devastated areas

in parceling land, restocking and soil-working; general distribution of live stock, fertilizer, seed, and agricultural machinery; measures for conserving domestic animals and fertilizers; organization of farming contests; systematic destruction of rodents; installation of a housekeeping school at Locre; and organization of experiment fields. In the course of the year 1919 the department acquired 50,000 metric tons of sodium nitrate, and distributed 35,494 horses, 8714 cattle, 4035 sheep, 937 pigs, 409 goats, 1901 cocks and hens, and 995 chickens. The work of 1919 anticipated the law of Nov. 15, 1919, and the programme for 1920 continued this work, adding thereto by loans from the German war indemnities and by agitating for subsidies to dairies serving the devastated regions. See **AGRICULTURE**.

During the eighteen months ending July 1, 1920, there was an extraordinarily rapid reconstruction of the economic life of Belgium and it was estimated that within less than a year all the industries with the exception of the steel plants would attain the production of the period before the war. Some of them had even passed that point in 1920. Agricultural recovery began at once after the armistice, and the crops in 1919 fully equalled those in 1913. The beet crop surpassed that of 1913 by 4,000,000 pounds. At the end of the war there were over 800,000 persons receiving the unemployment allowance but by the middle of 1920 the number had been reduced to less than 200,000. The following table prepared by the Minister of Industry, Labor, and Provisions shows the progress in the resumption of work from December, 1919, to June, 1920:

Industry	December, 1919 Percent- age	June, 1920 Percent- age
Mines	103	109
Quarries	57	70
Metallurgical	64	85
Ceramic	71	96
Glass	81	96
Chemicals	74	95
Alimentation	89	89
Textile	61	83
Clothing	67	80
Construction	86	302
Wood and furniture	66	80
Hide and leather	58	75
Tobacco	75	95
Paper	78	98
Books	76	77
Arts and crafts and instruments of precision	82	64
Transports	107	99

Industrial establishments of more than 20 workers employed in June, 1920, 606,960 persons, while in June, 1913, their working personnel amounted to 650,889 units. The working population in June, 1920, as shown above, thus represented 93 per cent of that of the corresponding period of 1913. In December, 1919, the establishments for which a census was taken had presented a resumption percentage of 76. From the point of view of production for the first six months of 1920, compared with that of 1913, it was noted that out of 3666 establishments in 1407, or 38 per cent of the number of enterprises considered, the production was more than 75 per cent. A little more than half of these enterprises, 2172 out of 4268, or 50.88 per cent, employed more than three-quarters of their personnel. The most important causes of unem-

ployment were: Lack of material, owing to destruction or removal by the enemy; lack of capital or delay in payment of indemnities; lack of orders; lack of raw material; lack of labor. The following table published by the Minister of Economic Affairs shows the percentage of recovery in respect to output based on the average of the year 1913:

Industry	Monthly average output for 1918 Tons	Output for April, 1920 Tons	Percentage of recovery
Coal	1,900,000	1,900,750	100
Coke	125,000	78,532	62.8
Cement	73,000	54,416	74.52
Blast furnaces	210,586	75,129	35.60
Finished iron and steel	154,821	77,718	50.30
Half-finished products	132,389	44,837	33.40
Converter steel	182,681	76,963	42.65
Martin steel	17,717	15,774	89.05
Raw zinc	16,800	6,527	38.83
Refined sugar	*9,206,967	*10,973,504	119.15
Paper and cardboard	11,528	10,064	87.32
Cotton spinning	*1,700,000	*1,400,000	82.32
Linen weaving	*280,000	*219,256	78.36

* Kilos. † Spindles. ‡ Looms.

In the linen industry, there were altogether about 375,000 looms in the country in 1913, but the recovery is estimated in the above table on the basis of the reports of the combination, which in 1913 had 280,000 looms.

MINERAL INDUSTRIES. Six new mines were opened in 1919 offsetting the production lost by those closed or destroyed. In August, 1920, it was estimated that the metallurgical industries had reached 44 per cent of their 1913 production of pig-iron, 68 per cent of finished iron, 52 per cent of finished steel, and 43 per cent of raw zinc. In 1913 Belgium stood fifth in the number of blast furnaces, being surpassed only by the United States, England, Germany, and France. On July 1, 1913, there were 55 furnaces in operation. By Jan. 1, 1920, the number had been restored to 52. Nearly half as much pig-iron was imported in the first five months of 1920 as during the whole year of 1913. The iron and steel industries were in a bad condition at the time of the armistice, but by the end of 1919 they were employing 60 per cent of the pre-war operatives and turning out 31 per cent of the pre-war output. See IRON AND STEEL.

ECONOMIC CONDITIONS. According to the Minister of Economic Affairs, while the coal mines in Belgium in the summer of 1920 were surpassing their 1913 production (though the quality of the coal produced was inferior), the metallurgical industry had reached 44 per cent of its 1913 production of pig iron, 68 per cent for finished iron, 52 per cent for finished steel, and 43 per cent for raw zinc. The cotton mills, in relation to their production figures for 1913, were producing 82 per cent, the linen mills 73 per cent, the artificial silk mills 68 per cent, the raw-leather factories 74 per cent, and the paper mills 87 per cent. As to prices, the official index number on June 15, 1920, showed a drop from 473 in April and May to 462, but the Brussels index at the same time mounted to 493, the highest point ever reached.

The labor situation at the beginning of the year appears from the following information supplied by the United States Bureau of Foreign and Domestic Commerce in December, 1920:

An official investigation of the Minister of Labor in December, 1919, revealed that Belgian industry was then employing 76 per cent of its 1913 workers, labor in coal-mining and transportation showing an excess. Many had gone to France or elsewhere for the greater remuneration, some had returned to the land, while others were still drawing assistance funds. The following table indicates the resumption of work in different industrial groups:

Industries	Number of workers		Percentage of resumption
	Number of enterprises	December, 1919	
Mines	189	153,370	103
Quarries	368	30,901	57
Metals	784	149,760	64
Ceramics	149	14,055	71
Glass	59	28,149	81
Chemicals	199	24,485	74
Foodstuffs	310	22,271	89
Textiles	967	129,524	61
Clothing	219	12,351	67
Construction	123	9,785	86
Wood and furniture	284	16,866	66
Hides and leather	150	12,752	58
Tobacco	88	6,870	75
Paper	78	6,501	78
Books	141	7,874	76
Arts and precision	89	5,120	82
Transportation	66	12,877	107
Total	4,263	643,000	76

The great increase in cost of living during and following the war was bound to result in demands for higher wages from every trade. To support these demands unionism grew by leaps and bounds, the number of union men in December, 1919, being 629,736. Strikes during 1919 numbered 372—nearly all for increased wages—and involved 184,555 workers.

COMMERCE. Foreign trade had made enormous progress since the war and even as compared with the year 1919 imports were said to have increased 267 per cent in quantity and 188 per cent in value during eight months, and exports 54 per cent in quantity and 608 per cent in value. The chief imports in 1919 had been manufactured articles, but in 1920 they were raw materials. Trade was resumed with Germany and during the first eight months of 1920 goods were imported from her to the value of 486,000,000 francs, while the exports to Germany amounted to 778,000,000 francs. At the close of the year there was still due from Germany a large proportion of the reparations. Belgium had the priority claim on the payment in gold of 2,500,000,000 francs before May 21st. Germany was to deliver \$800,000,000 worth of cattle, machinery, etc., to replace losses. Individual claims for war losses were placed at \$200,000,000. Belgium was to get 8 per cent of the German output of dyestuffs and chemicals, of which under the Treaty, 25 per cent was to be turned over to the Allies, down to the end of 1924.

FINANCE. The following information was supplied by the United States Bureau of Foreign and Domestic Commerce: The general budget for the fiscal year 1920, as introduced in the Chamber Jan. 20, 1920, provided for expenditures covering 8,566,410,731 francs and for receipts of 3,331,561,559 francs—expenditures exceeding receipts by 5,234,849,172 francs. Receipts and expenditures are classified in the budget as ordinary, extraordinary normal, extraordinary war,

and exceptional. Ordinary expenses increased over those of 1919 by 1,016,281,780 francs, due principally to increases in wages, charges of war, and the gendarmerie. Excess of ordinary expenditures over receipts of the same nature attained about 650,000,000 francs. This condition was influenced to the amount of 230,000,000 francs by the financial result of government administration of railroads, postal service, telegraph and telephone and marine. With industrial and commercial development and increase in the tariff, the situation would be modified. It was expected that military expenses would be compensated through reimbursement by Germany of an estimated expense of 95,000,000 francs for occupying the Rhine district. The extraordinary normal expenditures (near 400,000,000 francs) were for railroads, highways, national defense, canals, and rivers. Extraordinary war expenses (near 6,000,000,000 francs) affected reconstruction of devastated regions, revictualing of civilian population, war damages, railroads, advances on account of Germany's debt to Belgium, reconstitution of military buildings and army equipment, pensions, etc. Belgian national finances were thoroughly sound at the outbreak of the war. The public debt in 1914 amounted to 4,890,000,000 francs. Per capita wealth was estimated to be 7,247 francs and foreign investments 8,500,000,000 francs. Dec. 31, 1919, practically one year after the Germans had been driven from Belgium, the national debt stood as follows:

Items	Francs
Pre-war consolidated and floating debt ..	4,528,713,484
Direct pre-war debt	314,283,588
Loans since armistice:	
Monetary restoration bonds	3,040,342,700
5 per cent national restoration loan ..	1,559,637,200
3 per cent loan, second series	1,752,200
Treasury bonds	698,517,095
Advances from allies	1,247,488,633
Interprovincial debt (German war imposition)	2,347,800,000
Advances from Banque Nationale ..	5,800,000,000
Total	19,533,434,900

RAILWAYS. In 1919 out of the 2,200 kilometers of main railway lines destroyed, there remained only 55 to be rebuilt. Most of the bridges had been rebuilt. By July, 1920, the main lines had been so far reconstructed that the administration was planning to restore the branch lines, and a practically complete restoration was expected by July 1, 1921.

SHIPPING. There had been great damage done by the German armies in their retreat to the waterways in western and southwestern Belgium. As soon as this country was liberated the roads and bridges service set to work and by 1920 the devastation had been to a considerable degree repaired. The merchant marine in June, 1920, included 21 ships belonging to the state, and 171 vessels commercially owned, representing a gross tonnage of 378,630.

DEFENSE. At the close of the year, the military programme was absorbing public attention, and an important bill for the reorganization of the army was laid before the Chamber Dec. 11. It fixed the average effective of the army for 1921 at 100,000 men and besides that, 13,500 men detailed for the occupation of the Belgian zone on the right bank of the Rhine. See **NAVAL PROGRESS.**

GOVERNMENT. The executive power is in the King, who acts through a responsible ministry, and legislative power is in the King, Senate and Chamber of Representatives. The King in 1920 was Albert, born April 8, 1875, succeeded to the throne Dec. 17, 1909. He married Oct. 2, 1900, Princess Elizabeth of Bavaria, by whom he had the following children: Prince Leopold, Duke of Brabant; Prince Charles, Count of Flanders; and Princess Marie José. At the beginning of 1920 the leading parties in Parliament were the Catholics, Socialists and Liberals, the two former having a large majority.

At the beginning of 1920, the ministry was composed as follows: Prime Minister and Minister of Finance, L. Delacroix; Minister of Economic Affairs, H. Jaspar; Minister of Foreign Affairs, Paul Hymans; Minister of Education, J. Destree; Minister of Interior, J. Renkin; Minister of Agriculture, Baron A. Ruzette; Minister of National Defense, P. E. Janson; Minister of Justice, E. Vandervelde; Minister of the Colonies, L. Franck; Minister of Industry, Food Supply, and Labor, J. Wauters; Minister of Railways, Marine, Post and Telegraph, P. Poulet; and Minister of Public Works, E. Anseele. For new ministry, see below.

PARLIAMENT. Early in the year Socialists lost six seats in the Senate. Eight seats had been declared vacant on Feb. 6th, on account of the failure of the candidates to meet the income tax requirements before the elections, and in the by-elections which followed, the Socialists failed to reelect six of their representatives. A bill giving women equality with men in respect to voting in municipal elections, passed the Chamber March 10th, by 115 to 22 and the Senate by 60 to 33. In August, M. Hymans, the foreign minister, retired because during his absence his colleagues had refused to authorize the transport of war munitions into Poland. M. P. E. Janson, the war minister, resigned in September. Meanwhile, in May, M. Renkin, Minister of the Interior, had resigned as a protest against the agreement between Belgium and Holland. There were other signs of dissension in the cabinet and the crisis began as soon as the king returned to Brussels. M. Vandervelde, the Socialist Minister of Justice, supported by about one-third of the Chamber of Deputies, tried to force the Socialist and pacifist policy upon the ministry. In this he was supported by the Minister of railways, who was a champion of the Flemish party. After various combinations were tried, the King named as Prime Minister, M. Carton de Wiart, a member of the Right. There was opposition to him on the part of the Minister of Railways and his pro-Flemish supporters, but M. de Wiart succeeded in forming a combination of the Right, the Liberals and the Socialists. The principal issue at this time was that of military service. The Socialists opposed the present plan, and recommended service for six months, while the general staff demanded service for a year or at least ten months. There was much discussion over the question whether six months sufficed for the making of a soldier, but the general staff insisted upon a longer period. At this juncture, M. de Wiart had either to dispense with the support of the Socialists or to renounce the formation of a ministry. Finally, M. Vandervelde decided to consult the Socialist party by means of a referendum. The Socialist congress decided by a vote of 339,874 against

221,161 in favor of participation in the government on the basis of a provisional compromise proposed by M. Carton de Wiart. M. Vandervelde consented and accepted the portfolio of justice in the new ministry. Thus the new ministry like its predecessor was a combination.

THE NEW MINISTRY. The new ministry, announced November 30th, was composed as follows: Premier, Carton de Wiart; Minister of Justice, Vandervelde; Foreign Affairs, Jaspar; Economic Affairs, Van de Vyvere; National Defense, Devèze; Railways, Neujean; Science and Art, Desbree; Industry, Labor and Food, Wauters; Public Works, Anseele; Finance, Colonel Theunis; Agriculture, Ruzette; Colonies, Franck. The new Prime Minister, M. De Wiart, was well known as the author of standard texts on international law. He had been the head of the Belgian mission to the United States in 1914. The ministry comprised four Catholics, four Socialists, three Liberals and one Independent. The programme of the new ministry as set forth by the Prime Minister aimed at national concord and democratic action and would confine itself to problems that were immediately pressing, first of all, the revision of the constitution. In respect to foreign policy, Belgium would watch scrupulously over the execution of the Treaty and would support especially her Allies, France and England. It declared that the Franco-Belgian military accord would certainly reinforce the guarantees of peace.

THE SOCIALISTS. One of the first concerns of the Socialists toward the close of the year was the attitude of the Labor party, which was divided between the minority of extremists and the more conservative majority. The chiefs of the Socialist party had pronounced against the extremists and a member of the cabinet, himself a Socialist, had condemned the attitude of those who were causing a division in the party. He especially attacked the sort of Socialism which had resulted in the peace of Brest-Litovsk and the Bolshevik Socialism which had resulted in a dictatorship by a minority. Socialism must rid itself of the anarchists, he said, if it was to keep its solidarity. The inference from his remarks was, that the extremists ought to leave the party. It was estimated that if they did leave the party, they would make up only a small group, numbering hardly more than 10 per cent of the Belgian Socialists. See **SOCIALISM**.

FOREIGN AFFAIRS. Belgium and the Netherlands ratified the treaty in March for the settlement of the boundary and waterway questions, especially as regards the river Scheldt. According to the government programme announced in December the policy to be pursued in foreign affairs was one of peace and independence. It would insist upon the strict execution of the treaty, and especially upon the neutralization of the left bank of the Rhine and the complete payment of the indemnity by Germany. The method recommended at the conference of Spa was approved. The return to Belgium of Malmédy and Eupen was final and the authority of Belgium could not be discussed by Germany. The foreign ministry on December 8th referred to the language of the German government in respect to the occupied regions of Germany, saying the German Chancellor Feurenbach and Dr. Simons had entered those regions and made addresses of a provocative kind: that the Allies had protested

against this, and that if the facts were as they had been represented to be, the Allies would forbid members of the German ministry to enter the occupied regions. The minister defended the Government against the attacks of the pro-Flemish party upon the Franco-Belgian treaty. He expressed the hope that England would finally join France and Belgium in their defensive alliance. As to the negotiations with Holland, he hoped to have an early settlement, which however could not be made so long as the Dutch government refused to acknowledge the Belgian right to the waters of Wielingen. As to commercial relations with the Soviet government, he believed they should be opened, but that there should not be any renewal of political relations. See **WAR OF THE NATIONS**.

OTHER EVENTS. King Albert after a tour in Brazil landed at Lisbon and journeyed thence by airplane to Paris and from Paris to Brussels, arriving in the latter city November 3rd. At the meeting of the Belgian Trade Union Congress October 19th, a resolution was passed demanding the socialization of industries. A coal strike in the Charleroi district November 2nd on account of the refusal of employers to meet the demand for an increase of wages, spread to other regions and was threatening a general strike November 15th. Difficulty arose with the Netherlands at the beginning of November on account of the demand of Belgium for the extradition of the former librarian of the university of Ghent, who had been accused of treason for engaging in the Flemish movement when Belgium was under the Germans. The Dutch government referred the subject to a commission.

BENEDICT, ELIAS CORNELIUS. Banker and yachtsman, died at Greenwich, Conn., November 23. He was born at Somers, N. Y., Jan 24, 1834, and became a clerk in a Wall street office when a boy. After 1857, he organized the firm which bore his name and played an important part in the financial life of the city. He was better known in later years as a yachtsman, taking part in many extensive cruises and on one occasion being wrecked off the coast of Cuba.

BENOIT, PIERRE. See **FRENCH LITERATURE**.

BENSON, SIR RALPH SILLERY. British-Indian jurist, died at Dublin, Ireland, in October. He was born in 1861 and was educated at Trinity college, Dublin. Entering the civil service in 1871, he became registrar at the High Court of Madras, 1873, and was a judge in that Presidency from 1888-1913. He attracted attention by his work in famine relief at Cuddapah in 1876-78.

BERBER. See **AFRICA** and **PHILOLOGY**.

BEREA COLLEGE. A non-sectarian co-educational institution at Berea, Ky., founded in 1858. In the summer session of 1920, there were 214 students enrolled and in the regular fall session there were 794. The teaching staff numbered 138. The library contained 36,787 volumes. Dr. William Goodell retired from the presidency June 9th. On September 1st the following members were added to the faculty: Wilbur Greeley Burroughs, Professor of Geology and Biology; Noah Calvin Hirschy, Associate Professor of Romance Languages; Katherine Shepard Hayden, Assistant Professor of English Literature; Mary Thompson Sherwood, Assistant Professor of English; and Luther Martin Ambrose, Instructor in Chemistry. William James Hutchins, D.D., was inaugurated president, October 22.

BERKSHIRE FESTIVAL. See **MUSIC, Chamber-Music.**

BERKSHIRE STRING QUARTET. See **MUSIC, Chamber-Music.**

BERMUDA. A British colony in the West Indies, consisting of a group of small islands in the west Atlantic about 580 miles from Cape Hatteras, North Carolina, and 677 miles from New York. For many years they have been a favorite resort for American tourists, being celebrated for their climate and scenery. About twenty of them are inhabited. The total area is about 19.3 square miles; population, Jan. 1, 1919, 21,840, of whom 7,443 were whites. American visitors have averaged about 22,000 annually. Commerce and finance statistics follow:

	1915	1916	1917	1918
Imports	2579,828	2734,799	2674,493	2692,742
Exports	107,666	139,825	207,714	119,977
Revenue	106,467	107,055	100,447	91,645
Expenditure . .	97,643	109,652	105,867	90,684
Shipping * . .	1,748,337	1,630,163	547,835	732,613

* Tonnage entered and cleared.

The chief imports in 1918 were: Provisions; flour and meal; cotton goods; ale and beer; hardware and cutlery; groceries; oats; coal; sugar; apparel; leather goods; cattle. The chief exports were onions, potatoes and other vegetables. It is under a governor assisted by an executive council of seven members and a legislative council of nine members, both appointed by the crown, and a representative assembly of thirty-six members. The governor at the beginning of 1920, was Sir James Willcocks.

BESSARABIA. A former government of the Russian empire; united to Rumania in 1919. It extends from Galicia south toward the Black Sea, with Podolia and Kherson on the northeast, Moldavia on the south and southwest, and the Dobrodja on the south; area, 17,146 square miles; population, estimated Jan. 1, 1915, 2,686,600; estimated in 1919, 2,344,800. The racial elements are Moldavians and other Rumanians, Little Russians, Poles, Bulgars, Jews, Armenians, Greeks and Tatars. There are also some German and Ruthenian colonists. About 2,000,000 of the inhabitants are said to be dependent upon agriculture. After the defeat of the Central Powers, there was a Rumanian movement as described in preceding **YEAR BOOK**, which was the subject of much discussion in the press, being criticized on the one hand as a mark of the imperialist policy of Rumania and on the other hand justified as conforming to racial affinities and to the wishes of the people. In 1919 as a result of the peace treaties it remained in the hands of Rumania. See **RUMANIA**. It has been said in preceding issues of the **YEAR BOOK**, that Rumania had practically secured control of Bessarabia and claimed that on national grounds the country should be attached to her. This claim was disputed in certain quarters, where it was held that neither historically nor ethnographically were the claims valid. The proposal of a plebiscite by the Russians was refused by the Rumanians who held the country and government under a military occupation beginning in 1918. On Oct. 28, 1920, the governments of Great Britain, France, Italy and Japan signed at Paris a treaty with Rumania, ceding to her the former Russian province of Bessarabia. At the close of the year there were reports of an impending conflict between

the Reds and the Rumanians over its possession. During the Peace Conference the American delegates had opposed the giving of Bessarabia to Rumania. Troops of the latter occupied it nevertheless and some months after the American delegates had withdrawn, the French, British and Italian governments signed an agreement with Rumania under which Bessarabia was annexed. In October, 1920, the Soviet government began to send protests to Rumania on the subject of her occupation of the country.

BESSE, DOM. French ecclesiastic, prominent in the order of the Benedictines, died in August. He had devoted his life to propaganda for the Church, and to the education of the people in Catholic doctrines. He made a special study of the liturgy and published exhaustive works on the subject. While applying himself to the writing of articles for the periodicals on behalf of Catholicism and popularizing Catholic knowledge so far as possible, he believed the most effective means was to appeal to the higher intellectual classes and to this end he published twenty volumes on the subject of the Church and monarchy, besides treatises on liberal Catholicism, the Church and liberty, and the Syllabus.

BETHLEHEM BACH FESTIVAL. See **MUSIC, Festivals.**

BIBLE SOCIETY, AMERICAN. This organization was founded in 1816 for "the sole purpose of encouraging a wider circulation of the Holy Scriptures without note or comment," to all people, without denominational or racial discrimination. These Bibles, which are furnished at practically cost price, and in some cases free, are distributed all over the world, and in 68 languages, besides six systems for the blind. Reports for 1919 (the latest available statistics) show that 3,752,309 volumes of Scripture were issued during the year as against a total of 6,040,707 in 1918. Lack of supply and funds were the cause of this falling off. Of this total in 1919, 1,734,864 were issued in the home field, 1,954,671 in the foreign agencies, and 62,774 by foreign correspondents in other parts of the world. During its 104 years the Society has supplied 82,697,551 volumes in the United States and 55,206,388 in foreign lands, making a total of 137,903,939 volumes. During the year the Bible House printed 1,237,575 volumes or about half of its output in 1918, besides more than 420,000 pamphlets and reports. Distribution among the war forces of the United States continued in 1919 to the extent of 379,088 volumes, making a total distributed in this way of 4,920,543 during the war. Abroad 41,270 volumes were supplied, chiefly among the European forces, making a total during the war of 1,887,758, or a grand total of 6,808,301. Contributions of \$247,121.57 were received for this work. The work is carried on through 11 foreign agencies with about 1,000 workers, and nine home agencies with about 600 workers. Receipts during 1919 were \$857,037.23, as against \$853,544.80 for expenses, while for the Army and Navy Fund \$9,721.63 was received and expenses amounted to \$4,803.72. Appropriations for 1920 by the Board of Managers amounted to \$988,000. During the year 2,500 volumes of Scriptures were given to the large Czechoslovakian detachment as they passed through Norfolk, Va. The most notable contribution in translation and revision was the completion of the Union Revision of the Mandarin Version of the Bible. This makes the Scripture

now available in a language said to be spoken by more people than any other on the face of the earth, about 300,000,000. The translation of the four Gospels into Mukri Kurdish was completed. Gifts, legacies, and income from funds at interest during the year amounted to over \$495,000. The Society is affiliated with 155 Auxiliary Bible Societies who do much work locally. They also contributed to the central Society, contributing in 1919 about \$23,000. The officers of the Society in 1920 were: President, Churchill H. Cutting of New York; general secretaries, Rev. William I. Haven, and Frank H. Mann; and treasurer, William Foulke. *The Bible Society Record* is the official organ of the Society. National headquarters are maintained at Bible House, Astor Place, New York City.

BICYCLING. See CYCLING.

BILLIARDS. Professional billiards had an off year in 1920, when for the first time since 1863 no championship tournaments were contested. The fact that the professional cue experts could make more money performing at exhibitions in the various large cities contributed in no small degree to the dearth of title contests. William Hoppe was called upon to defend his 18.2 balkline honors in December but had little trouble in disposing of the challengers, Welker Cochran and Jacob S. Schaefer.

The amateurs saved the game in 1920. There were five challenge matches for the Metropolitan Amateur Cup in all of which Edward W. Gardner of Montclair, N. J., triumphed, thereby becoming owner of the trophy which had to be won five times by one player.

David McAndless of Chicago captured the Eastern amateur 18.2 title in a tournament held at the Amateur Billiard Club in November. Percy Collins also of Chicago, however, defeated McAndless in the Class A tournament of the National Association of Amateur Billiard Players, held at Boston.

The national amateur pocket billiard tournament held at the New York Athletic Club again resulted in complete success for J. Howard Shoemaker, who had won every previous contest of the kind.

BIOLOGY. See ZOÖLOGY.

BIRD, CHARLES. American brigadier general, died March 22. He was born at Wilmington, Del., June 17, 1838, and was made first-lieutenant in the First Delaware Infantry, May 20, 1860. He served during the Civil War, rising to the rank of colonel, and distinguished himself in the battles of Fredericksburg and Spottsylvania. During the Spanish-American war he was colonel and quartermaster of volunteers and was raised to the rank of brigadier-general of volunteers, Jan. 3, 1901. In 1902 he was retired with the rank of brigadier-general in the regular army.

BIRDS. See ZOÖLOGY.

BIRTH CONTROL. The birth-control movement has arisen anew in practically every civilized country of the world since the world war and especially during 1920. The idea brought recently to the fore in the United States by Margaret H. Sanger, advocating the knowledge to prevent conception as an immediate means for women's personal and economic freedom, differs in its viewpoint from the neo-Malthusian movement of England, although the methods are the

same. While there has been much controversy in all countries among the most eminent authorities on science and economics concerning the Malthusian doctrine, there was practically no controversy or dispute concerning the right of the individual woman to have knowledge whereby she may control the number of children in her family. During 1920 there was a new interest and a new centre of birth-control activities in Tokio, Japan, emanating from the movement in the United States. There was also increased activity in Mexico under the direction of Mr. and Mrs. Linn A. E. Gale. South America also came to the front and much of the literature published in the English language was translated into Spanish and circulated among the working people in the various South American countries. While in all the European countries there was a distinct interest in the principle of birth control, France on the contrary, alarmed at her great losses through the war, started a vigorous campaign to increase her population. The birth rate is increasing in France, but the death rate of infants is also on the increase, so that it may take two or three generations of human waste before France will ever increase her population to any extent worth while. Germany, on the other hand, has seen the result of prolific child-bearing, and to-day with her millions of children underfed and starving, the great mass of people there recognize that birth control adopted immediately is the only means of restoring economic balance. In Italy, Holland, Belgium, the Scandinavian countries, Austria, and practically all the other countries in Europe, there was growing interest and increased activity. In England this was especially true. A committee was then formed for the purpose of encouraging a reduction of births in all European countries. It was said by many publicists of England, such as Harold Cox, editor of the *Edinburgh Review*, Dean Inge, Dean of St. Paul's Cathedral, London; Mr. J. O. P. Bland, writer, and others, that the peace of the world depends upon an understanding of the population question, and that it concerns tremendously the English-speaking nations to understand this question, thereby encouraging the other over-crowded and high birth rate countries to bring down their population so that the world peace and prosperity may continue.

The centre of the movement in the United States is in New York City, 104 Fifth Ave., the organ of which is the *Birth Control Review* with Margaret H. Sanger as editor.

BIRTH RATE. See VITAL STATISTICS.

BISSELL, GEORGE EDWARD. Sculptor, died at Mount Vernon, N. Y., August 30th. He was born at New Preston, Conn., Feb. 16, 1839, and served in the Civil War. He went into the marble business with his father and brother at Poughkeepsie, N. Y.; studied for years in France and Italy, and had studios in Paris and Florence. His works include many public monuments and statues, both in the United States and abroad. Among them were portrait statues of Abraham Lincoln and President Arthur, and bronze statues of Admiral Faragut and General Sherman.

BISSOLATI, SIGNOR. Italian Socialist politician, died at Rome, Italy, May 6. He was widely known as the leader of the Socialist element in Italy which remained faithful to the government during the war. In 1892 he became editor of the Socialist newspaper, the *Avanti*, and

he was elected to the Chamber in 1897. He continued a member of the house until his death. In 1911 the Socialist party split and Bissolati organized the group known as the Reformists Socialists. In June, 1916, after the fall of the Salandra government, he was appointed to the cabinet and served under Premier Bosselli as well as in the succeeding ministry of Orlando. During the war he made frequent visits to the front and addressed the soldiers. In February, 1917, he visited England.

BLAIR, HENRY WILLIAM. Senator, died March 14. He was born at Campton, N. H., Dec. 6, 1834, and was admitted to the bar in that State in 1859. He was a member of Congress, 1875-79, and 1903-05 and he served as United States Senator from 1879 to 1891. In 1891 he was appointed minister to China, but resigned on account of the Chinese objections to his attitude on the subject of Chinese immigration. He was the author of several important measures, including those for the extension of Federal aid to State education, for establishing the United States Labor Department and for various temperance, financial and educational laws. He wrote a pamphlet and a volume on the subject of the temperance movement.

BLANC, EDMOND. French sportsman, died at Neuilly, France, December 12. He was born in 1861, the son of François Blanc, who was known as the greatest gambling house proprietor of his time and who for many years possessed the gambling concession at Monte Carlo. Edmond was one of the most noted sportsman on the French turf. He was seven times the winner of the Grand Prix and the owner of a famous racing stable.

BLISS, HOWARD SWEETSER. Educator, died May 2. He was born in Syria, Dec. 5, 1860, and graduated at Amherst College in 1882. After teaching in various American colleges, he studied at German universities; was ordained in the Congregational ministry in 1890, and for several years was pastor at Montclair, N. J. He succeeded his father as president of the Syrian Protestant College at Beirut in 1902.

BLOODGOOD, ROBERT. See PAINTING AND SCULPTURE.

BOGART, JOHN C. Engineer, died in New York City, April 25. He was born at Albany, N. Y., Feb. 8, 1836; graduated at Rutgers College, 1853, and after 1877 was engaged on a great variety of important works, both for the government and for private corporations. He was for six years chief engineer of the department of Public Parks in New York; four years State engineer of New York, and he was engineer of the Board of Health in that State. Among his works were the Washington Bridge in New York, harbors in Venezuela, hydraulic and electric constructions at Niagara Falls, in the St. Lawrence River, in British Columbia, at Knoxville, Tenn., Atlanta, Ga., and many other places. He was also consulting engineer for various railways, for the Rapid Transit Commission of New York, etc., and was the only civilian member of the United States Government Board on the Lakes to the Gulf Waterway.

BOGERT, JAMES JOHN. Canadian prelate, died February 10. After 1897 he was archdeacon of Ottawa. He was born Aug. 2, 1835, educated at Trinity College, Toronto, and was ordained in 1858. He was rector of St. Auburns Church, Ottawa, 1881-1914.

BOGGIO, EMILE. See PAINTING AND SCULPTURE.

BOHEMIA. Formerly a crownland of Austria; after the collapse of the Central Powers in 1918 a constituent member of the new Czechoslovak state (see CZECHO-SLOVAKIA); in the northwestern part of the former Austro-Hungarian empire, bounded on the north by Saxony and Silesia; on the east by Moravia and on the south by Moravia and Lower and Upper Austria. The area is about 20,065 square miles; population, 1910, 6,769,548; estimated, 1913, 6,860,029; of whom over 2,000,000 were reported as engaged in agriculture. The racial elements according to the census of 1910 were as follows: German-speaking, 36.7 per cent; Bohemian, Moravian and Slovak, 63.19 per cent. The small remaining portion of the population was made up mainly of Poles and Ruthenians. The Catholics at the census of 1910 constituted 95.60 per cent of the population. Prague, the capital and largest city, had an estimated population, June 30, 1914, of 541,500, including suburbs. A large part of the population are engaged in industries, the number being given at 2,780,457. In the old empire the country was governed locally by a single chamber of 252 members and was represented in the lower house of the Reichsrath by 130 members.

BOHEMIAN CLUB FESTIVAL. See MUSIC, *Festivals*.

BOILERS. The most interesting tendency of boiler design in 1920, was the use of a greater number of tubes in height and in some cases the arrangement of these in two decks or groups. This resulted in increased efficiency as the only drawback was a small increase in draft resistance. Increased boiler pressures were becoming more common, 300 pounds being frequently encountered and 350 pounds figuring in the designs and installations of the year. In fact, competent authorities spoke of the possibility and feasibility of using boiler pressures even higher and test boilers operating up to 500 pounds had been employed. The tendency to construct large boilers also continued and units capable of evaporating 150,000 pounds of water in an hour were installed and were used to advantage with the largest steam turbines. This, however, seemed to be the limit of capacity, as it was preferable to have a number of units so that one or more could be shut down for repairs or when not needed.

Carrying out the general considerations for increased height, an interesting boiler plant was built for the Colfax Power Station of the Duquesne Light Co. Here a water-tube boiler of the cross-drum type was divided into two decks with 6 tubes in the lower deck and 14 in the upper, making 20 in total height, the tubes being 20 feet long. Those in the lower deck were exposed for their full length without baffles to the radiant heat of the furnace, while the upper group of tubes were baffled, there being a duplex furnace. Each boiler had 23,050 square feet of heating surface, so that each unit would have a nominal rating of 2305 horse power. In this type of boiler the superheater is located above the lower deck of boiler tubes.

Mechanical engineers were beginning to realize the necessity for intelligent supervision and close control of the boiler-room operation, and it was increasingly clear that all the best talent of the operating staff should not be devoted to the en-

gine room, especially in these days of automatic control.

Another step in the direction of increased boiler efficiency was where blast furnace gases were being burnt under boilers. This had been increased from 50 per cent, which once was considered satisfactory, to 78 per cent. Modern boiler practice demanded the increased use of economizers, but where the tubes were banked to an increased height as discussed above, economizers were not considered always necessary.

During the year progress was made in extending the use of the American Society of Mechanical Engineers' Boiler Code and four States, Oregon, Utah, Arkansas, and Maryland, adopted it and also the cities of Scranton and Seattle, so that it was in force in 17 States and 11 cities.

BOKHARA. A state of Central Asia, lying to the north of Afghanistan and to the south of the Russian provinces of Syr-Daria and Samarkand; formerly under the government of the Russian empire. The area is estimated at 83,000 square miles; population about 12,250,000; chief towns, Bokhara about 75,000 and Karshi about 25,000. The Russian Trans-Caspian traverses the country, passing within a few miles of the capital and extending to Tashkent. The chief products are corn, silk, tobacco, fruit, cotton, hemp, and the chief minerals are gold, salt, alum and sulphur. Camels and farm animals are raised. There is considerable trade with India, to which raw silk is exported and from which tea, indigo, muslin, drugs, etc., are imported. The reigning sovereign at the beginning of 1920 was Ameer Sayid-Mir-Alim Khan.

BOLIVIA. A republic situated in the interior of South America, to the west of Brazil and to the east of Chile. Sucre, the seat of the supreme court is historically considered the capital, but the actual seat of government is La Paz, the largest city.

AREA AND POPULATION. The area is variously estimated at from 514,155 square miles to 532,437 square miles and, including disputed territory, 562,047. The population was estimated in 1915 at 2,889,970, but a lower and perhaps more trustworthy estimate places it at 2,268,000. La Paz had a population in 1915 of 100,097; Cochabamba, 31,014; Potosi, 29,795; Sucre, 29,686.

EDUCATION. Primary education is free and compulsory and the number of elementary schools in 1918 was 450, with 3960 teachers and 58,400 pupils. Secondary instruction was supplied by 21 colleges, 5 clerical institutions, 5 private lycées, with 180 teachers and 2598 pupils; higher education by 19 institutions, with 78 professors and 1291 students. There are two universities, at Sucre and La Paz, and there is a National Conservatory at La Paz with a war college for officers. In 1918 the government spent 3,020,672 bolivianos for educational purposes.

PRODUCTION, COMMERCE, ETC. Agriculture is in a backward state, though mainly sufficing for local needs. The area under cultivation is placed at 4,940,000 acres, which will be increased by measures of irrigation recently undertaken. The chief crops are corn, wheat, barley, beans, potatoes, and other vegetables, but the main commercial crop is rubber, in respect to which Bolivia ranks next to Brazil among the exporting countries of South America. The rubber industries are centred in the Amazonian region. The production reached its highest figure in 1911 and then declined until 1915, but since then has rap-

idly increased. The exportation in 1918 amounted to 4,287,514 kilos, valued at 11,038,042 bolivianos. The United States was the chief country of destination, receiving 84.22 per cent of the exports in 1918. The chief natural resources of Bolivia are mineral and include tin, copper, antimony, lead, wolfram, silver and a varying of other ores, besides large salt deposits. The following table gives the weights and values of mineral exports in 1918:

	Quantity Kilograms	Value Bolivianos
Tin ore	48,801,027	129,611,139
Copper	26,000,381	7,746,343
Wolfram	8,418,859	10,640,392
Lead ore	4,589,432	1,795,207
Antimony ore	6,836,068	4,155,322
Bismuth ore	490,072	4,431,168
Zinc		
Silver	12,915,517	7,491,421

Total foreign trade for 1918 was as follows: Imports, £2,720,000; exports, £14,600,000. The railways open for traffic in 1918 had a mileage of 1354. The principal line is the Antofagasta and Bolivian railway, from Antofagasta to La Paz (735 miles).

On May 12, 1920, the Bolivian Congress granted to an Argentine firm a contract for the construction of the railway from La Quiaca in Argentine to Turpiza in Bolivia. This line the construction of which had been contemplated since 1915 will form another link in the chain which will eventually connect the Argentine and Bolivian railroad systems and furnish through communications between Buenos Aires and La Paz. In 1920 the 128 miles between Atocha and La Quiaca, Turpiza being a midway point, were open to mule travel, though the road was passable by automobile during a part of the year—from about the middle of May to about the middle of November.

The completion of this railway to Atocha was destined to have an important economic bearing as it would undoubtedly strengthen greatly the commercial relations between Bolivia and Argentina. Not only would it offer a better market to the products of the Provinces of Jujuy, Salta and Tucuman, but it would furnish the means of importing manufactured goods into Bolivia from as far as Buenos Aires, a traffic that was seriously handicapped by the difficulties of transport between the frontier and the Bolivian railhead at Atocha. A through route therefore would enable Argentine manufactures to compete with those of Chile, as well as with American and European products. The standard of value is gold and the monetary unit is the boliviano, of a par value in American currency of 39.932 cents. The expenditures for 1920 were estimated at 47,369,000 bolivianos and the revenue at 49,470,000 bolivianos. The debt on June 30, 1919, was placed at 68,869,161 bolivianos, of which 38,933,525 were external debt.

GOVERNMENT. The executive power is vested in a president elected for four years by direct popular vote and ineligible for reelection and in a cabinet of six members for the following departments: Foreign relations and worship; government and justice; finance; public works and industries; war and colonization; education and agriculture. Along with the president, two vice-presidents are elected for the same term. The legislative power is in a congress of two houses,

the senate with 16 members elected for six years, one-third retiring every two years, and the chamber of deputies of 70 members elected for four years, one-half retiring every two years. The president at the beginning of 1920 was Señor José Gutierrez Guerra, inaugurated Aug. 16, 1917.

HISTORY. Bolivia became involved in 1919 in the long-standing dispute between Chile and Peru over the ownership of the provinces of Tacna and Arica (see CHILE). This concerned a claim of Bolivia to territory in the province of Arica. It was reported on February 13th that Bolivia claimed possession of a port in this province. This brought a protest from Peru, whose government declared that it would not relinquish its title to the territory. Public opinion in Bolivia became exasperated and a mob attacked the Peruvian legation at La Paz. The United States government intervened as a peacemaker and the Brazilian government offered to arbitrate. The provisional government of Bolivia was recognized by France October 26th. At the same time the president, Bautista Saavedra, declared that the persons who had left the country on account of political disorders were free to return.

BOLSHEVIKI, BOLSHEVISM. See WAR OF THE NATIONS; SOCIALISM; and articles on countries under *History*.

BOOTS AND SHOES. The year 1920 was full of interest for the boot and shoe industry as well as for the consumers of these products. The year started with a general belief that there was underproduction and with good business at prevailing prices for manufacturers and retailers. By March, however, the retail dealers became frightened and soon prices fell rapidly and production was curtailed. Stocks of shoes were returned for slight or no reasons whatsoever, and there were many cancellations of orders. At the beginning of the year raw materials and leather were virtually at their peak, while at the end raw materials and finished product were at pre-war prices with labor plentiful at the shoe manufacturing centres. Despite the violent decline in prices the industry as a whole came through the year in a generally satisfactory condition though the wholesalers had cleaned out their stocks and taken their losses in most cases. During December there was a more hopeful tone with increased production indicated and keen competition for business. The usual changes in styles were marked during the year and the output of low shoes for women increased as their wear became more general. At the close of the year shoe factories in the Middle West were reported to have a fair amount of business with the possible exception of those in Michigan and Wisconsin where the cancellations of earlier orders had resulted in large stocks. Towards the end of the year the factories working on high grade men's shoes were operating four to five days a week, while plants making women's shoes, anticipating changes of styles, were more active.

An interesting sidelight on the industry was the opening of bids by the United States War Department for 250,000 pairs of service shoes for the United States Army. The lowest bidder agreed to make the first 50,000 pairs for \$4.07, which indicated a surprising reduction on materials and costs of manufacture. See HIDES AND LEATHER.

BORNEO. See BRITISH NORTH BORNEO.

BOSCHI, JULIUS. See ROMAN CATHOLICS.

BOSNIA AND HERZEGOVINA. Former provinces of the Turkish empire acquired by Austria-Hungary in 1908 and after the disruption of the Austro-Hungarian empire incorporated in the new southern Slav state of Jugo-Slavia (q.v.). Area, 19,768 square miles; population at the census of Dec. 31, 1910, 1,898,044.

BOSTON, MASS. See GARBAGE AND MUNICIPAL GOVERNMENT.

BOSTON SYMPHONY ORCHESTRA. See MUSIC, *Orchestras* and *Novelties*.

BOSTON, UNIVERSITY OF. A non-sectarian institution of learning at Boston, Mass.; founded in 1869. In the fall of 1920, the student enrollment was 8024, and there were 496 members of the faculty. The productive funds amounted to \$4,279,363, and the income for the year, \$864,477. The library of the university contained 126,392 volumes. The university comprises colleges of liberal arts, business administration, and secretarial science; schools of theology, law, medicine and education; a department of religious education and social science; and a graduate school. President, Lemuel Herbert Murlin, D.D., LL.D.

BOTANY. The Botanical Society of America, the Ecological Society of America, and the American Phytopathological Society, met at Chicago, Ill., Dec. 27, 1920, to Jan. 1, 1921, in affiliation with the American Association for the Advancement of Science. The British Association for the Advancement of Science met at Cardiff, Wales, Aug. 24 to 27, 1920. The first meeting of the Dutch East Indies Scientific Congress was held at Batavia, Java, Oct. 3 to 6, 1919. The Society of Economic Biologists of Great Britain held its meeting Dec. 10 to 11, 1919.

The Advisory Board of the American Plant Pathologists met in Washington, D. C., Jan. 28 to 31, 1920, to consider the establishment of a Phytopathological Institute. A summer meeting of the American Phytopathological Society was held Aug. 3 to 6, 1920, beginning at Staunton, Va., and extending its sessions through West Virginia and Maryland to Pennsylvania, studying en route the diseases of apples and peaches and the means employed for their control. The Canadian branch of the society met at Guelph, Ont., Dec. 11, 12, 1919, and the southern division at Atlanta, Ga., Feb. 24, 25, 1920. At all these meetings papers of botanical interest were read and discussed. A Crop Protection Institute was organized under the auspices of the National Research Council. Its membership is composed of plant pathologists, entomologists, chemists, and manufacturers who are interested in the problems of the control of plant diseases and pests.

Under the regulatory powers of the Department of Agriculture two new restrictive orders, of interest to plant pathologists, were promulgated. These are Order No. 41, which prohibits the importation of the raw or manufactured state of maize, broom corn, sorghum and related species, except under regulations, and Order No. 44 which restricts the introduction of all kinds of stocks, cuttings, and other propagating materials of fruits from Asia, Japan, Australia, Philippine Islands, etc., except under special permit.

Several new serial publications that are of interest to botanists made their appearance during the year, among them *Hereditas*, devoted to research in heredity; and the *Indian Journal of Botany*, which intends publishing papers on ecology, plant physiology and histology. The *Plant*

World, formerly published at Tucson, Ariz., has been merged with *Ecology*, the first number of which appeared early in 1920.

Among the botanists who have recently died were: J. G. Baker, long connected with Kew Botanical Gardens, England, Aug. 16, 1920; O. Beccarini, director, Botanic Garden, Florence, Italy, Oct. 25, 1920; G. Briosi, Italian plant pathologist, May 4, 1920; A. DeCandolle, Swiss botanist, May 29, 1920; Reginald Farrar, botanical explorer in China, Burma, and elsewhere, Oct. 16, 1920; J. M. Macoun, Canadian botanist, Jan. 8, 1920; W. Pfeffer, professor of botany, University of Leipzig, Jan. 31, 1920; F. Kolpin Raven, Danish phytopathologist, May 24, 1920; P. A. Saccardo, editor of *Sylloge Fungorum* and director Botanic Garden, Padua, Italy, Feb. 12, 1920; and C. A. Timiriazeff, professor of botany, University of Moscow; S. M. Tracy, American botanist and experiment station worker, Sept. 5, 1920.

The literature of botany has been very voluminous during the year, a large number of delayed contributions having become available. Only a very few of the many important papers can be noted here.

PHYSIOLOGICAL STUDIES. A notable contribution during the year was the report of the studies of Garner and Allard on the effect of the relative length of day and night on growth and reproduction in plants. By controlling the daily periods of illumination they were able to retard or accelerate growth and reproduction of a number of species of plants. The time required for plant growth from germination to flowering was increased or diminished by lengthening or shortening the period of daily illumination. When the period of daily illumination was shortened seed production was hastened and in this manner early and late maturing varieties of the same species were caused to mature at practically the same time. The normal yearly cycle of many plants was shortened or lengthened almost at will and annual, biennial and perennial plants were profoundly modified as to their behavior.

DeBestiero and Durand found, from a study of the growth of peas, that the dry weight of roots and aerial parts was increased with an increase of intensity of illumination. They claim that light loving plants are incapable of adapting their chlorophyll absorptive power to weak illumination and cannot make up their carbon requirements through greater absorption of organic carbon through the roots. On the other hand Rivera considers the accumulation of carbohydrates in plants is due to the number of hours which plants are exposed to sunlight and not the intensity of the illumination. Shanz found that ultra-violet and other short rays of light exert a remarkable effect on the development of plants. Anthocyanin was not found when ultra-violet rays were excluded, and the decomposition of chlorophyll was retarded in the absence of such rays. Ultra-violet rays are said to retard germination. Tsuji claims that ultra-violet rays may be utilized to accelerate growth of sugar cane and the ripening of such fruits as pineapples and bananas.

From a study of the hydrogenion concentration of plant juices, Clevenger found that acidity is influenced by a number of factors, such as time of day, stage of growth, portion of plant tested, illumination, temperature, etc. Acids were found to accumulate during the night to be destroyed

in the day. Dixon and Atkins found the concentration of the sap of plants varied with seasons and at different levels of the same plant. In the maple, sugars are present in maximum amounts in early spring and at 10 meters from the ground the percentage was 5.5 in February and in the roots 1 per cent. In October the percentages were 0.5 and 0.6 per cent, respectively. No great differences were noted in the amount of sugars in evergreen trees, either at different heights or during different seasons. Gurjar claims the relative proportion of carbohydrates and proteins in plants is dependent upon the nitrogen supply. Changes in the carbon-nitrogen ratio of plants is said to profoundly modify their metabolism. Respiration was found to vary directly and photosynthesis inversely with the carbon-nitrogen ratio.

Bokorny has brought together data regarding the nutrition of plants, and shown that a large number of organic compounds can supply the carbohydrate and protein nutrients of plants. Hepburn, and his associates, found in the pitchers of *Sarracenia* the proteolytic products formed from the digestion of insects are absorbed and utilized by the plants. It is thought probable that phosphates and other mineral materials are utilized in a like manner. Loeb, MacDougal, and others are continuing their studies of synthetic cells, colloid gels, etc., as contributing to the phenomena of permeability, imbibition, and growth. Loeb has shown that the mass of roots and shoots formed by sister leaves of *Bryophyllum* is in direct proportion to the mass of the leaves. He also considers gravity and inhibiting factors the forces which direct the regeneration of *Bryophyllum*. Coupin, from a study of etiolated plants concludes that chloroplasts in the presence of light produce a substance that has a retarding effect on growth. Illick, from a series of daily measurements of trees through several years, found their growth was twice as great at night as in the day and that the annual growth of white pine, spruce, etc., in Pennsylvania is completed early in July.

The rôle of vitamins in plant growth has been investigated by Willaman and it was found that two vitamins are necessary for the growth and sporulation of *Soleoortinia cinerea*. Budington claims that constituents in the thyroid glands influence protoplasmic activity in plant as well as in animal cells. The growth of onion root tips was stimulated by adding thyroid material to culture media but potassium iodid in equivalent amounts did not do so. Pituitary and suprarenal substances had no effect on growth. Baines has announced a new theory regarding electrical systems of plants. He claims that every plant, fruit, tuber, and seed is an electrical cell that cannot be polarized or discharged so long as it remains structurally complete. The skin, or rind, of fruits and vegetables serves as an insulating material for the conservation of electrical energy. In general the edible portion of plants is electrically positive. Growth, he claims, may be stimulated by a continuous current of low potentiality and proper sign.

Pickering has given additional data showing the injurious effect of plants on each other when grown together or in succession in cultures. No toxic exudation from the roots has been found. The toxic element is not corrected by lime but it is quickly oxidized. In his experiments, the grassing over of orchards was fol-

lowed within two years by a reduction of more than 50 per cent in the yield of fruit. Panatelli claims that resistance to cold by plants is due to the proportion of sugar retained within the cells during refrigeration and not to an accumulation of acids or salts. He considers sugar a source of energy for respiration or it may act to protect protoplasm against proteolysis or ultimate autodigestion. Ackerman has drawn a similar conclusion regarding frost resistance of wheat. According to his observations the higher the sugar content the greater the resistance to cold.

Beijerinck claims that free bacteria do not fix nitrogen and he presents the hypothesis that *Bacillus radicicola* is only indirectly concerned in the assimilation of free nitrogen of the air, and that the fixation is due to the protoplasm of the host plant acting as a catalyst.

PLANT BREEDING. Miss E. R. Saunders in the presidential address of the Botanical Section of the British Association for the Advancement of Science, summarized our knowledge regarding the processes of heredity and calls for more work by cytologists for the elucidation of the intricate problems involved in breeding. Roberts has performed a service to plant breeders in giving much data regarding forgotten facts relating to early investigations on the crossing of plants. East claims that Lotzy's theory of evolution, through hybridism, is open to criticism. East believes that the F₁ generation, arising from partially sterile inter-species hybrids, would furnish the variability required for evolution under domestication but he claims that evolution under domestication must not be confused with natural evolution.

Conklin concludes that Mendel's Law is of universal application so far as the segregation of inheritance factors is concerned, and that there may be no other type of inheritance. The mechanism of inheritance, he claims, is to be found in the germ cells and he believes the evidence points to the localization in the genes in the chromosomes. On the other hand, Yves Delage criticizes Mendelism and while admitting great advance has been made in understanding some of the phenomena of breeding he predicts the downfall of Mendelism from the weight of the accessory hypotheses that have been offered to explain special cases. DeVries has given additional evidence of mutation in *Oenothera*. He claims *Oenothera lamarckiana simplex* is a homozygous mutant and is not the result of the crossing of any earlier forms.

The occurrence of so many apparent mutants in plants and animals has caused many investigators to believe that many inherited differences have appeared in this way. DeVries has called attention to the loss of a factor that has to do with the production of green coloring matter in seedlings of certain plants that results in their early death. This tendency is apparently inherited in typical Mendelian ratios. Winge claims that variegation in plants is inherited but in a non-Mendelian manner. Bateson considers variegation in *Enonymus* to be a recessive character. Collins and Kempton have described a fine striping of the leaves of maize and claim the striping is inherited as a recessive Mendelian character. Stout, from a study of hermaphroditism in plants found reciprocal crosses may give opposite results.

Salaman and Lesley have described prostrate

and decumbent stemmed varieties of potatoes that have appeared in their breeding experiments. The varieties are reproduced through the planting of their tubers, are productive and are considered especially valuable on account of their ability to withstand drought. The common belief of breeders that degeneration begins in a variety as soon as selection ceases has been shown true for peas by Bateson and Pellew. The presence of rogues in any series present plants that never breed true to type. Hayes, from a study of several generations of wheat hybrids, concludes it is possible to produce varieties of wheat resistant to the black stem rust, *Puccinia graminis*. Plant breeding for resistance or immunity to disease is being given a large amount of attention on account of its practical importance. Reports have been made of varieties of wheat resistant to rust, potatoes to black wart and rot, flax to wilt, eggplant and tomatoes to bacterial diseases, hops to mildew, etc.

PLANT DISEASES.—The important rôle which plant diseases play in the United States may be recognized in that Congress appropriated more than a million dollars to the Department of Agriculture for the study of diseases and their control or exclusion. In addition the various agricultural experiment stations of the country reported investigations in progress on more than 300 plant disease projects. The Plant Disease Survey of the U. S. Department of Agriculture reports very great reductions in crop yields in 1919 due to plant diseases. Among the reductions reported as due to these causes are: wheat, 192,275,000 bushels; corn, 200,060,000; oats, 78,353,000; potatoes, 86,997,000; tomatoes, 207,168,000; apples, 18,920,000; peaches, 7,028,000 bushels, and cotton, 1,742,000 bales.

According to Stevens the "take all" of wheat, reported as occurring in Illinois and Indiana in 1919, is not the disease known under that name in Europe, Australia, and elsewhere but is a disease due to a species of *Helminthosporium*. A similar disease was recently described in Minnesota by Mrs. L. J. Stakman. Kirby and Thomas report the presence in New York in July of the past year of what is probably the true take-all of wheat due to *Ophiobolus graminis*. The area where the disease was found was covered with gasoline and burned. The flag, or leaf smut, *Urocystis tritici*, reported in 1919 on wheat in Madison County, Ill., has spread during the year and about 2,500 acres were reported as infected. This area has been placed under quarantine and measures have been adopted to stamp out the disease if possible.

A nation-wide search was made in 1920 for the potato-wart disease, *Chrysophlyctis endobiotica*, and it was found in but nine counties in Pennsylvania and two localities in West Virginia, the total infested area being about 100 acres. Efforts are being made to prevent its spreading to new areas and to eradicate it where now present. Tests have shown that a number of standard varieties of potatoes are completely immune to the wart disease. The tomato has been found to be a host plant for the fungus and this fact must be recognized in rotation experiments for its elimination.

The white-pine blister rust, *Peridermium strobi*, first found attacking white pines in New England in 1915, has spread west through New York, Michigan and Wisconsin to Minnesota in-

volving nearly all the white pine areas of this continent. The attempts to eradicate the disease on the white pine have been abandoned to a large degree, and now efforts are being made to control it. The fungus spends part of its cycle on species of *Ribes* from which it passes to the pine. Preliminary results indicate the possibility of the control of the disease by removing all the currant and gooseberry bushes in the vicinity of pine trees and active coöperation has been established between the federal and state governments for the control of this serious disease. The citrus canker, *Pseudomonas citri*, which threatened the citrus industry in the southern states, has been practically eradicated from the greater portion of this region. A recent report of the Florida Plant Board shows at the end of September no new infestations and only seven infested properties in the State. This disease has been recently reported in the Northern Territory of Australia. In South Africa, where eradication by burning has been adopted, only three infested regions are now known to exist. The mosaic disease of sugar cane has been found to be present in most of the cane-growing regions of this country and in addition it attacks corn and many grasses. The disease appears to be infectious and Brandes has demonstrated that it can be carried by insects. The disease of potatoes usually called tip burn has been shown by Ball to be due to the potato aphid.

Weston has given a detailed account of his investigation of the downy mildew of maize due to *Sclerospora philippensis*. On account of the serious nature of this disease a quarantine has been established by which the introduction of corn from the Orient is restricted. Continued investigations show the wide distribution and economic importance of the root rots of corn and the scab of wheat due to *Gibberella saubinetii*. A nematode disease of wheat widely spread in Europe is reported by Byars as occurring in California, Virginia, West Virginia, Maryland, and Georgia.

Winkler, *Verbreitung und Ursache der Parthenogenesis im Pflanzen- und Tierreiche* (Jena, 1920).

BOURCHIER, THOMAS DAVID. British newspaper correspondent, died at Sofia, Bulgaria, December 30. For many years he had been the Balkan correspondent of the London *Times*. He was the son of a justice of the peace in County Cork, Ireland; was educated at Trinity College, Dublin, and at Cambridge, winning high honors in both institutions; and taught for some years

at Eton. He became special correspondent of the *Times* in Rumania and Bulgaria in 1888 and thereafter represented that newspaper in southeastern Europe, where he acquired the confidence of most of the rulers and of the leading politicians. Having been at the university an excellent Greek scholar, he was particularly sympathetic with Greece, which he frequently visited. He wrote an important series of articles for the *Times* after the first Balkan war and was intimately associated with Bulgarian affairs during the greater part of his career. He aided the Cretans with his advice and helped to prepare the way for ultimate union with Greece. He probably had a more detailed knowledge of the affairs of southeastern Europe than any other writer for the press and he contributed extensively to the various periodicals.

BOURY, EUGÈNE AUBOURG DE. French zoölogist, died in France, April 17. He was born in 1857. He was a collector of mollusks of the genus *Scalaria* and during the last ten years of his life gathered an extraordinary variety of these rare shells for the Prais Museum of Natural History, raising the number of specimens from 300 to 3000. He published many papers on the subject.

BOWDEN, HENRY GEORGE (better known as Father SEBASTIAN BOWDEN). British Roman Catholic ecclesiastic, died in September. For many years he had been a member of the London Oratory. He was born in 1836; educated at Eton and at the Irish Catholic university in Dublin. He left the latter institution at the age of nineteen and entered the military service. After twelve years with his regiment and on staff duty he joined the London Oratory and in 1870 was ordained priest. His influence over the young was remarkable and the boys educated under his direction became in many instances valuable servants of the state and church. He was Superior of the Oratory from 1889 to 1902 and from 1903 to 1907.

BOWDOIN COLLEGE. An institution of the higher learning at Brunswick, Maine; founded in 1794. The enrollment for the fall of 1920 was 403, and there were 30 members in the faculty. The productive funds of the college amounted to \$2,648,392, and the income for the year was \$178,536. The Bowdoin Medical School enrolled 65 students and had 62 members on its teaching staff. The college library contained 122,000 volumes. Mortimer Phillips Mason, Ph.D., was added to the faculty as Professor of Philosophy, and Glenn Raymond Johnson, A.M., as Assistant Professor of Economics and Sociology. New courses were offered in philosophy, government, and the fine arts. A campaign for an alumni fund was inaugurated and more than \$100,000 was secured by the Yale plan. President Kenneth Charles Morton Sills, LL.D.

BOWLING. The twentieth annual tournament of the American Bowling Congress was held at Peoria, Ill., April 9. J. Shaw of Chicago won the individual championship with a score of 713. S. Mercurio of Cleveland was second with 702. The other winners were: Doubles, Rickson, and Krem of Chicago, with 1301; five-man team, Brucks No. 1 of Chicago, with 3096.

BOXING. The year 1920 was marked by an unprecedented boom in professional boxing. It witnessed the transfer of the world's middle-weight championship from Mike O'Dowd to

Johnny Wilson, the overthrow of Pete Herman, world's bantamweight champion, by Joe Lynch and the crowning of Georges Carpentier of France as world's light heavyweight champion at the expense of Battling Levinsky. Jack Dempsey twice successfully defended his world's heavyweight title first against Billy Miske at St. Paul, Minn., and again against Bill Brennan at Madison Square Garden, New York City. The showing made by the champion in his bout with Brennan was a great disappointment to his admirers who had confidently predicted that the challenger would not last three rounds. As it was it took Dempsey 12 rounds to batter Brennan into submission. The brave stand made by Brennan encouraged the hopes of the followers of Carpentier that the light heavyweight champion would have as good as an even chance with Dempsey when they meet in 1921.

The marvelous Benny Leonard again reigned supreme in the lightweight world, disposing of Joe Welling and Richie Mitchell in battles for the title.

The championships of the Amateur Athletic Union were held at Boston, Mass., April 5 and 6, the results of the final bouts being:

One hundred and eight pounds, A. J. DeVito, New York City, defeated William Cohen, New York City, three rounds; 115 pounds, James Hutchinson, Philadelphia, defeated Neal Brock, Cleveland, three rounds; 125 pounds, Tommy Murphy, Kansas City, Mo., defeated B. Ponteau, New York City, three rounds; 145 pounds, Jack Schoendoerf, Milwaukee, defeated Roy Helton, Kansas City, Mo., four rounds; 158 pounds, Sam Lagonia, New York City, defeated Frank Grayber, Pittsburgh, three rounds; 175 pounds, John Burke, Pittsburgh, defeated Edward Eagan, New Haven, three rounds; heavyweight, Karl Wicks, Dorchester, defeated Joe Geroux, Boston, one round.

BOYS' AND GIRLS' CLUB WORK. See AGRICULTURAL EXTENSION WORK.

BOY SCOUTS OF AMERICA. The Boy Scouts of America was incorporated Feb. 8, 1910, and chartered by Act of Congress, June 15, 1916. The organization numbered, December, 1920, 382,936 Boy Scouts and 113,276 adult leaders, including local council and troop committee members, scout executives and commissioners, scoutmasters and their assistants. Boy Scouts are organized in patrols, of eight boys each, four patrols to a troop. Every troop must be chartered and rechartered annually by the National Council of the Boy Scouts of America. Each troop is under the direct leadership of a scoutmaster and one or more assistants, all of whom must be commissioned by the National Council. Assistant scoutmasters must be at least 18 years of age, and are usually young men who have passed through the ranks of Scouting and are consequently especially well fitted to aid in the training of the troop in Scouting activities. The scoutmaster must be at least 21 years of age and be an American citizen (or have declared intention to become such). All Scout leaders are men of proved moral worth and interest in boys and such as are willing to subscribe to the Scout Oath and Laws.

The purpose of the Scout movement as set forth in the Constitution of the National Council, Boy Scouts of America, is as follows: "To promote thorough organization, and coöperation with other agencies, the ability of boys to do

things for themselves and others, to train them in scoutcraft, and to teach them patriotism, courage, self-reliance, and kindred virtues, using the methods which are now in common use by Boy Scouts, by placing emphasis upon the Scout Oath and Law for character development, citizenship training and physical fitness." The Boy Scout programme is endorsed by leading educators, statesmen, clergymen, and public men generally throughout the country. It is a practical solution of the leisure hour problem, providing as it does, a wholesale, appealing plan of outdoor activities such as every boy enjoys as a scheme of recreation. It serves as a vigorous incentive to all round development, physical, mental and moral. The programme includes training in campcraft, knot-tying, first aid, signaling, public and personal health, nature study, trailing and tracking as well as a large field of specialized merit badge subjects, as for instance, photography, gardening, chemistry, bird study, forestry, sculpture, automobiling, firemanship, wireless and a host of others, all of which may well prove fascinating and worth-while boy hobbies, and even lead to definite vocational trails.

During the year 1920, 72,805 merit badges were awarded to Scouts, 1564 qualified for Life Scout rank, 1564 for Star Scout, and 586 for Eagle Scout rank. Scouts are according to their state of advancement classified as tenderfoot, second or first class scouts. First class scouts are eligible to merit badge awards and may qualify for the advanced rank of Life, Star or Eagle Scout. Scouts who have been active in the movement for five years or more are eligible to membership in the Veteran Scout Association.

The chief objectives of the Scout programme are the training of character and the making of good citizens. *Be Prepared* is the Scout Motto and service is the great ideal of the movement. Scouts are pledged to "be helpful to all people at all times," to do a "good turn" daily and to be ready for service, in any capacity, great or small, to the community and to the nation, the church, and school and the home. The phases of the scout coöperation in community activities are legion. They participate in the city clean-up, "walk-rite," and anti-fly campaigns, work with the police and fire departments, with health officers, park commissioners, and forest and game wardens. They coöperate with the Red Cross, the Y. M. C. A., Knights of Columbus, Salvation Army and kindred organizations. In fact they stand ready to give their services freely and efficiently to whatever good cause can use their organization for service. Scouts are trained in first aid, fire prevention and life saving. During the year 1920, two gold medals, 13 silver medals, 77 bronze medals, and 57 letters of commendation were awarded by the National Court of Honor, Boy Scouts of America, to Boy Scouts for conspicuous acts of courage and efficiency in the saving of life, at the risk of their own.

In 1920 (Feb. 8-14), the movement celebrated its Decennial with an appropriate coast to coast programme which included special emphasis upon the "Good Turn." Other outstanding events of the year 1920, were the "Birthday dinner," in honor of Daniel Carter Beard, National Scout Commissioner and dean of Scouting in America, held February 4 at the Hotel Commodore, New York City; the Tenth Annual meeting of the National Council, B. S. A., held in New York

City, March 25, 26, with members present from all over the Union and the first bi-ennial conference of Scout Executives held at Bear Mountain in September.

Perhaps the most noteworthy event in the 1920 history of the Boy Scouts of America was their participation, through a picked group of Scouts and leaders, over 360 in number, in the first International Boy Scouts Jamboree held at Olympia, England, July 31 to August 7, a meeting in which Scout representatives of twenty-three nations came together. The Boy Scouts of the delegation from the United States represented over 200 American communities and were under the leadership of Colonel L. R. Gignilliat of the Culver Military Academy. After the "Jamboree" closed the Scout delegation went to France for a brief educational visit including a tour of the battlefields of Northern France and a Scout gathering in Belgium at which King Albert received the Scouts. An international conference of Scout leaders was held in London, August 20-30, with President Livingstone, Vice-President Mortimer Schiff, Chief Scout Executive James E. West, and Messrs. John M. Phillips and Bolton-Smith, Executive Board members, as the official representatives of the Boy Scouts of America. It is of interest also to note that Mr. Lorne W. Barclay, Director of the Department of Education, Boy Scouts of America, was loaned by the National Council at the request of the American Committee for Devastated France, to conduct a Boy Scout Camp at Compiègne, France, during the summer of 1920, to help French Scouts by giving them the benefit of the American programme, system and equipment.

The Honorary President is the Hon. Woodrow Wilson, the Honorary Vice-Presidents are the Hon. William H. Taft, the Hon. William G. McAdoo and Daniel Carter Beard. The active officers are: President, Colin H. Livingstone, Washington, D. C.; vice-Presidents, Mortimer L. Schiff, New York City; Milton A. McRae, Detroit, Mich.; Benjamin L. Dulaney, Bristol, Tenn.; Arthur Letts, Los Angeles, Cal.; Robert J. Thorne, Chicago, Ill.; National Scout Commissioner, Daniel Carter Beard, Flushing, L. I.; Treasurer, George D. Pratt, New York City; Chief Scout Executive, James E. West, New York City.

The National Headquarters of the organization are at 200 Fifth Avenue, New York City, N. Y.

BRADY, CYRUS TOWNSEND. Clergyman and novelist, died at Yonkers, N. Y., January 24. His many novels were among the most popular of their time. He was born at Allegheny, Dec. 20, 1861; graduated at Annapolis in 1883, and was for several years employed on railroads in the West. He studied theology and was ordained priest in the Protestant Episcopal Church in 1890. He was rector of churches in Missouri and Colorado; was deacon in Kansas until 1895; in Pennsylvania, till 1899; then rector of churches in Ohio, Missouri, Mt. Vernon, N. Y., and from 1914 to the time of his death was assistant minister in St. Stephen's Church, New York. He served as chaplain in the Spanish-American War. After 1899, he applied himself to writing and published books at short intervals. The list which is too long to be repeated here, covered a great variety of subjects, including historical narratives, recollections of experience

in church work, sketches of various battles and historical episodes, military leaders, Indian fighters, etc., and comprising especially, a series of extremely popular stories of adventure. Among his later books may be mentioned: *My Lady's Slipper* (1905); *The Love Test* (1908); *Adventures of Lady Susan* (1909); *The Better Man* (1910); *As the Sparks Fly Upward* (1911); *Chalice of Courage* (1912); the "Dash-away" series of novels; *The Fetters of Freedom* (1913); *Little Angel of Canyon Creek* (1914); *A Baby of the Frontier* (1915); *The More Excellent Way* (1916); *By the World Forgot* (1917); and *A Little Book of Christmas*, (1917).

BRADLEY, THOMAS W. Former Congressman, died at Walden, N. Y., May 30. He was born April 6, 1844, served during the Civil War with distinction, and was wounded in the battles of Gettysburg, the Wilderness and Petersburg. He became a member of the New York Assembly in 1876 and was delegate to the Republican National Conventions from 1892 to 1908, with the exception of 1904. He was member of Congress from New York from 1903 to 1913.

BRANDT, HERMANN CARL GEORGE. College professor, died at Utica, N. Y., December 20. From 1883 he was a professor of German at Hamilton College. He was born in Vilsen, Germany in 1850; came to the United States in 1867; graduated at Hamilton College in 1872; and studied at the University of Göttingen, Strasburg and Freiburg. In 1874, he became instructor at Hamilton College, and from 1876 to 1882 he was associate-professor of German at Johns Hopkins. He wrote a number of textbooks for schools and colleges.

BRASHEAR, JOHN ALFRED. Celebrated telescope builder, and manufacturer of scientific instruments, died April 8. He was born at Brownsville, Pa., in 1840 and became a machinist and later an engineer. In 1870 he undertook the manufacture of astronomical instruments and was actively engaged in that work after 1880. From 1898 to 1900 he was acting director of the Allegheny Observatory. He was a member of the leading scientific bodies throughout the world within his sphere of interest.

BRAZIL, UNITED STATES OF. A Federal republic of South America, the largest state on the continent. The capital and largest city is Rio de Janeiro.

AREA AND POPULATION. The area has been officially estimated at 3,280,900 square miles or an excess of more than 250,000 square miles over the area of continental United States, exclusive of Alaska area, according to another estimate, 3,275,510 square miles. It comprises twenty states, a federal district and one territory. The population according to the census of 1900, was 17,318,556 (another estimate, 17,371,069), and according to the estimates of 1917, 30,492,275, or an average density in 1917 of 8.3 per square mile. The number of Indians in the Amazon area is placed at 600,000. The chief cities with their estimates of population in 1913 are as follows: Rio de Janeiro, 975,818; São Paulo, 450,000; Bahia, 348,130; Belem, 275,167; Pernambuco, 216,484. From 1820 to 1917 the immigration amounted to 3,428,651, of which in late years the chief element has been Italian. In 1919 immigrants numbered 57,101 as compared with 27,752 in 1918.

PRODUCTION AND INDUSTRY. The main occu-

pations are agricultural, but only a small part of the soil is under cultivation. By far the chief article of commerce is coffee. The single state of São Paulo produces about one-half the world's crop and along with Rio de Janeiro, Espírito Santo and Minas Geraes produces about four-fifths of the world's crop. In 1919-20 the product was estimated at 3,818,750 bags. Rubber is grown chiefly in the forests of the Amazon and around Para, Ceara and Manaos. It is also one of the chief products; others are tobacco, sugar, cotton, cereals, and vegetables. In 1920 the cultivation of hemp was becoming an important industry and the government was taking measures to encourage the cultivation of cotton. For many years the fibre plants of Brazil have been exploited. Chief among these is the piassava, of which there are several species and which has figured latterly to an increasing extent in Brazilian exports to the United States. It grows wild and no cultivation is necessary. Others of value are the piteira, armania, papoula,

Vinegar	419

Table china and glassware	18
Hardware	29
Total	26,493

COMMERCE. There was a great development of commerce during the war and exportation for the first time of a number of products including rice, chilled meats and corn, and cassava meal. In 1919 the exports amounted to 1,907,688 tons valued at 2,178,719 paper contos and imports to 2,779,625 tons valued at 1,334,358 contos, which made the largest total of the last two years. The following table taken from the *Statesman's Year Book* of 1920 shows the chief exports in 1919 and 1918.

	Quantities 1919	Quantities 1918	Value 1919	Value 1918
Coffee (sacks)	12,963,000	7,433,000	272,607,000	219,041,000
Rubber (metric tons)	33,252	22,662	6,240,000	3,998,000
Tobacco	43,280	29,755	4,357,000	2,263,000
Sugar	69,429	115,634	3,714,000	5,459,000
Yerba Maté	90,200	72,781	3,201,000	2,151,000
Cocoa	62,584	41,865	5,602,000	2,158,000
Cotton	12,158	2,594	2,437,000	524,000
Leather	56,790	45,584	6,027,000	3,991,000
Hides	5,166	2,215	3,072,000	669,000

sida, and gravata. The coffee crop for 1919-20 was estimated at 3,818,750 sacks. The number of factories in Brazil has been estimated at 11,335, with 151,841 employees and the annual output at 741,536,000 milreis in 1918; cotton factories numbered 202 with 78,186 employees; and in 1916 there were 2036 tobacco factories. See AGRICULTURAL EXPERIMENT STATIONS.

According to statistics recently compiled by the National Treasury for the purpose of levying a consumption tax, there were 26,493 manufacturing establishments in Brazil in 1916, classified as follows:

Tobacco products	2,036
Beverages	13,577
Matches	29
Salt	1,005
Shoes	5,993
Perfumery	475
Pharmaceutical specialties	945
Preserves	657

The United States was the country of destination in 1910 for the following Brazilian exports: Coffee, cacao, sugar, rubber, carnauba wax. In 1918 the countries of destination were in order of importance, the United States, Argentina, Italy, Uruguay, the United Kingdom, and France, the United States receiving more than twice as much as any other country.

COMMERCE. The foreign trade of Brazil was valued at \$531,626,150 in 1918 as against \$493,548,180 in 1917, showing an increase of \$38,077,970 for the year under review. Imports during 1918 were worth \$247,351,150 and during 1917, \$209,434,487. The import trade of Brazil has shown a consistent development since 1914, with the exception of 1915. Trade, however, has not attained the value reached in 1913, \$326,025,511.

Imports into Brazil for the six years, 1913 to 1918 inclusive, are given in the appended table by countries of origin:

Countries	1913	1914	1915	1916	1917	1918
United States	\$51,226,362	\$30,075,029	\$46,968,238	\$76,238,664	\$98,722,602	\$88,982,702
Great Britain	79,782,389	39,698,493	31,886,695	39,667,499	37,713,580	50,469,450
Germany	56,973,330	25,734,821	2,202,507	86,186	227,872	...
France	31,900,321	12,875,209	7,205,798	10,117,764	8,456,017	11,836,983
Argentina	24,263,720	15,880,369	23,143,815	27,364,520	27,326,441	46,974,712

All other countries	7,478,476	9,802,956	20,496,043	8,165,340	9,179,463	8,840,500
Total	813,628,078	221,539,029	255,658,826	265,801,811	284,113,693	284,275,000

FINANCE. A unit of currency is the real, but the common denomination is the milreis, consisting of over a thousand reis. A conto equals 1,000 milreis. In 1920, the revenue was estimated at 119,452,949 gold milreis and 514,258,200 paper milreis; the expenditure at 72,372,326 gold milreis, and 599,578,557 paper milreis.

RAILWAYS. Of the total mileage, 18,662 opened for traffic Jan. 1, 1918; 9455 belonged to the central government; 6231 to private companies; and 1527 to the States, the chief owners among the states being São Paulo, and Minas Geraes. The principal railway is the Central Railway owned by the Federal government, with a mileage of 1466. On January 12, the government appropriated 50,000,000 milreis for maintenance and improvements. The railway system is connected with that of Argentina, Paraguay and Uruguay.

During the year the Commission of Finance of the Federal Congress of Brazil approved the proposal of Sampaio Correa regarding the electrification of some lines of the Estrada Ferro Central do Brazil, a government-owned railroad. By unanimous resolution the executive committee was authorized to open a credit of about \$11,000,000 to cover the cost of changing the railroad system from steam to electricity on the suburban lines from the central station in Rio de Janeiro to the following stations: Deodoro, Barra do Pirahy, Santa Cruz, Paracamby and Maritima. The executive committee also ordered the preparation of plans for the prolongation of some or all lines to the center of the city, if possible to the Praça Mauá, having authorized the opening of the necessary credit, should the project be approved by the prefect of the federal district.

POSTS AND TELEGRAPHS. In 1910 the post offices numbered 3,642 and the telegraphs had 54,463 miles of line. The government controlled 45,047 miles.

GOVERNMENT. The executive authority is vested in the president, elected directly by the people for four years and not eligible for re-

election. Along with him the vice-president is chosen. The legislative power resides in a national congress consisting of the chamber of deputies and the senate. The former has 212 members elected by direct vote for three years and the latter 63 members elected for nine years, of whom one-third are renewable every three years. The president, Dr. Epitacio da Silva Pessoa was elected April 13, 1918, for the remainder of the period 1918-1922. The vice-president in the first part of the year was Dr. Delphim Moreira (q.v.) who died, July 1.

The ministry was chosen by President Pessoa, as follows: Homero Baptista (Finance), Azevedo Marques (Foreign Affairs), Alfred Pinto (Interior and Justice), José Pires do Rio (Transportation and Public Works), Raul Soares de Moura (Marine) João Pandia Calogeras (War), and Simeos Lopez (Agriculture).

HISTORY. The president's message dealt with the reorganization of the departments of state, including the establishment of a ministry of instruction, public health, and with the reclamation project of the northeast. On May 3, a new tariff bill was proposed, providing for reduction of duties on articles of prime necessity. A strike of railway-men in March was followed by a general strike which checked the movement of industry for a month. In 1920, the king of Belgium paid a visit to Brazil, where he was received with great enthusiasm, being the first European sovereign to visit a South American country. He arrived at Rio de Janeiro on a Brazilian dreadnought on September 19 and made a tour of the Brazilian states early in October. The Senate passed a bill conferring upon him the title of citizen and making him a marshal of the army. His visit was the occasion of a new commercial and financial agreement between Brazil and Belgium. The former prime minister of Italy, Orlando, arrived at the capital as ambassador to Brazil, October 20.

At that time there was a difficulty which required adjustment arising from the seizure by D'Annunzio of a Brazilian steamship at the port of Fiume. Brazil was concerned over the question of immigration, and as the settlement of the country was not proceeding rapidly enough, measures were taken for facilitating the entry of Jews from the Ukraine in November and for settling them on the public lands. The Italian ambassador, Orlando, was taking measures to protect Italian immigrants, who were next to the Portuguese, the most numerous element in the immigration. See **NAVAL PROGRESS**.

BREAD. See **FOOD AND NUTRITION**.

BRECK, GEORGE WILLIAM. American mural painter, died at Flushing, L. I., November 21. From 1904 to 1909 he had been the director of the Academy of Fine Arts in Rome. He was born at Washington, D. C., Sept. 1, 1863; studied at the Art Students' League in New York and won a scholarship for the study of mural painting. After that he studied at the Academy of Fine Arts in Rome. After 1910 he remained in New York. Among his mural decorations are those of the University of Virginia; Saint Paul's Church at Rome; the Watertown Public Library. He won a silver medal at the St. Louis exposition in 1904.

BRECKINRIDGE, MADELINE McDOWELL (Mrs. DESHA). Woman suffragist, died at Lexington, Ky., February 25. She was born at Woodlake, Ky., May 20, 1872, and in the latter half of her life was very prominent in all suffrage activities, being president of the Kentucky Equal Rights Association, 1912-15, and again in 1919. She was also active in many philanthropic and public welfare movements, including child labor, tuberculosis, charities, nursing, etc., and did much toward promoting legislation for improvement in these fields. She was vice-president of the National Woman's Association, 1913-14 and president of the Lexington Civic League.

BREEDING. See **LIVESTOCK**.

BREEDING PLANTS. See **BOTANY**.

BRETHREN, CHURCH OF THE. Organized at Schwarzenau, Germany, in 1708, this denomination is commonly known as Dunkers. It comprises a membership of about 100,000, with more than 1000 churches and 3300 ministers. Missions are maintained in India, China, Denmark, and Sweden. During the year two representatives of the church were making a tour of inspection of the present missions and contemplating a visit to Africa with the idea of establishing a mission on that continent in the near future. The famine which occurred in certain sections of China during the latter part of 1920 was very severe in the Church of the Brethren territory. The Home Board of Missions called upon the Brotherhood for a large offering to relieve suffering in that land. In order to co-ordinate the work of the various church boards, the "Forward Movement Organization" was established. One person selected from each board and general committee in the church constitutes the Executive Committee. This committee meets quarterly for the promotion and coördination of the general church work. The Annual General Conference of the church was held at Sedalia, Mo., in June. At that time an offering of \$700,000 was pledged for mission and production work. Ten colleges are maintained, having in 1920 a total enrollment of about 2500. Sunday Schools numbered about 1300 with a

total enrollment of about 124,000 pupils and 13,000 teachers and officers. The headquarters of the various church boards are in Elgin, Ill., including the General Mission Board, General Educational Board, General Sunday School Board, General Christian Workers' Board, Temperance Board, General Relief Committee, and the Peace Committee. The publishing house is at Elgin, Ill., and the organ of the church is known as the *Gospel Messenger*.

BREX, TWEELS. London journalist, died in 1920. He wrote essays of a light character whose value was discovered by Lord Northcliffe who made him a contributor to the *Daily Mail*. During the last six years of his life he wrote continuously for that newspaper and his articles were widely read. A biography was published in 1920 by a friend and colleague, Mr. Hamilton Fyfe, under the title of *Tweels Brex—A Conqueror of Death*.

BRIDGES. In 1920 general bridge design and construction figured more prominently than in previous years, and this was also true for the consideration of a number of important projects whose realization was, in the nature of events, problematical. In the United States the return of the railways to their owners from government control had led to the earnest consideration of necessary improvements and replacements which the increased weight of rolling stock, or on some of the larger lines increased traffic, often had rendered necessary. The revival of interest on the part of American railways in bridge building was of itself important, for much of the most important design and construction always had been in this field. Furthermore with the increased use of motor trucks on highways, bridges of increased strength were required at many crossings. Finally there were discussed during the year a number of very important plans whose realization would have an important bearing on terminal conditions or on methods of access to great cities. Naturally as these had not been constructed it was easy to find an explanation in the magnitude or engineering difficulties of the work. Therefore, when great structures were proposed to cross the Hudson from Manhattan to New Jersey, the Delaware River at Philadelphia, and the Detroit River at Detroit, and engineers were engaged in preparing plans for such works, it can be appreciated that this field of engineering was fairly active. Such plans while not consummated during the year were destined, when prepared, to attract considerable attention as with the more modern steels and increased knowledge certain modifications in designs and weights of structures, over those of earlier builders could be attempted.

In Europe, beyond repair work and reconstruction due to the war, not much in the way of progress was recorded. In China certain new bridges were proposed, but here as elsewhere, high costs and financial conditions had to be considered. In the following paragraphs a few of the more notable bridges proposed or under construction during the year are outlined:

PROPOSED HUDSON RIVER BRIDGE AT NEW YORK. Manhattan Island separated as it is from New Jersey where all but one of the leading trunk lines terminate, occupies a certain isolation which involves many commercial disadvantages. Accordingly in 1920 various measures such as tunnels (See **TUNNELS**) and bridges were under way or being discussed to remedy

this condition. One of the proposed projects was that of a massive suspension bridge located at or below 59th Street, Manhattan, and crossing to the New Jersey shore, beginning with its approach at Ninth Avenue, New York City, and terminating on the top of the Palisades, a distance of approximately 10,000 feet or the same as the vehicular tunnel whose construction was begun during the year. This plan was proposed by Gustav Lindenthal, the bridge engineer responsible for many notable American structures, and was discussed by him in a paper before the annual meeting of the American Society of Mechanical Engineers at New York Dec. 8, 1920. Mr. Lindenthal's plan provided for a bridge with two decks, 180 feet wide, the lower deck accommodating eight railroad tracks, and two tracks for a moving platform, and the upper deck providing for highway and local traffic, four lines of rail, 12 lines for vehicles and two sidewalks. The eight railroad tracks would connect with a two-story elevated railroad on the West Side, with the New York Central tracks along the river front, and also with a union passenger station.

The total cost of the bridge, liberally estimated was \$100,000,000, or only about one-third to one-fourth the cost of 20 tunnels that would be required to afford equivalent freight and passenger accommodation between New York and New Jersey.

Furthermore, such a bridge it was claimed would contribute materially toward solving the very serious port difficulties which were embarrassing the growth or even the successful prosecution of New York commerce. Such a bridge would bring relief to seven railroad systems for the freight transfers across the river, exclusively done on floats, and aggregating on the average some 3000 cars daily, with an annual growth of some 10 per cent.

In this connection it is possible to compare New York transportation facilities across the East River with those at the North River. While the commercial importance is far less, there were in 1920 four large municipal bridges with 36 tracks for rail cars and 16 lines for vehicles in addition to 16 subway tunnels or 52 lines of traffic on a river front of about six miles. Furthermore two additional bridges and 16 subway tunnels were under discussion. On the North River there were but the Hudson Tubes, Pennsylvania Railroad Tunnels, and the Vehicular tunnels started in 1920.

DELAWARE RIVER BRIDGE. This important project advanced nearer realization on Sept. 23, 1920, when a board of three engineers to make a traffic, location and design survey and report on a highway bridge over the Delaware River at Philadelphia was appointed by the interstate bridge and tunnel commissions of New Jersey and Pennsylvania in joint session. The board was composed of Ralph Modjeski, consulting engineer, New York; George S. Webster, chief of the Bureau of Surveys, Philadelphia; and L. A. Ball, consulting engineer, New York. Mr. Ball, a resident of East Orange, N. J., was selected by the New Jersey authorities to represent that State.

For the survey report an appropriation of \$100,000 was made by the commissions, this sum including the fees of the board members. It was expected that the report will be completed within six or eight months. Three sites were

to be investigated, one located south of Market Street, the other two north of Market. Borings to disclose the foundation material, studies of property values and an estimate of the cost of the bridge were to be included in the report.

THE DETROIT-WINDSOR BRIDGE. The plans for a bridge over the Detroit River at Detroit, Mich., announced during 1920, contemplated a suspension bridge of 1770 feet clear span, carrying two 28-foot roadways, two 7-foot sidewalks, two street-car tracks and four railway tracks. The main span would be 100 to 110 feet clear of the water. Railroad approaches, on $1\frac{1}{2}$ per cent grades would be about a mile long. The estimated cost of the bridge was \$28,000,000. The cost of a highway bridge at the same location would be about \$11,500,000, making the cost to add the four railway tracks about \$16,500,000.

It was proposed to invite all the railroads shipping cars across the river to join the project on an equal basis, on the basis of calculations showing the cost per car to be not above the prevailing cost of ferrying. The number of railroad cars crossing the river in 1920 was estimated at 1,700,000 annually, and the projectors of the bridge calculated that the railways could safely guarantee the bridge 1,000,000 cars a year by 1925. The bridge was proposed as a measure of economy as the cost of tunnels with equal capacity was estimated at upwards of \$60,000,000.

The engineers decided in favor of the suspension bridge design on the basis of economy, safety of erection, aesthetics and the time in which the structure can be completed. The engineering investigation was conducted by Charles Evan Fowler, consulting engineer, New York City, while Gustav Lindenthal, New York City, was retained as consulting engineer. On December 28th the city council of Detroit decided to postpone indefinitely action on the bids for the construction of the Belle Isle Bridge, a second series of which were submitted. The alleged ground was that the structure could not be completed within the \$3,000,000 bond issue authorized by the votes in 1919.

CHICAGO BASCULE BRIDGE. In May, 1920 there was put in service at the Michigan Avenue Run crossing of the Chicago Run at Chicago, Ill., a new double-deck double-leaf fixed-counterweight trunnion bascule highway bridge of 256 feet span. This construction was designed for very severe service requirements and has highways at two levels in order to separate fast and slow traffic. The bridge is an important link in the widening and extension of Michigan Avenue between Randolph Street and Chicago Avenue, connecting the business district with the northside section of the city. There are viaduct approaches which at the ends of the bridge are widened to form extensive and ornamented plazas, and these connect with the upper roadway of the bridge, while the lower deck carries the slow and heavy commercial traffic from the various terminals, docks and industrial buildings in the neighborhood. A clear channel of 220 feet is provided by a span of 256 feet centre to centre of trunnions and there is head room of $16\frac{1}{2}$ feet for 80 per cent of the channel width with the bridge closed, and 120 feet for the entire width of the channel with the bridge open. Each leaf consists of four trusses, one advantage of which is that the bridge could be separated into two parallel parts in case of emergency. The two inner trusses are spaced 6 feet centre to centre, and the outer

trusses 27 feet. The upper deck has two 27-foot roadways between trusses and two 15-foot sidewalks on cantilever floor beams. The lower deck has two 18-foot roadways and two 6-foot sidewalks, all within the trusses. The overall width of the upper deck is 91 feet, 9 inches. Each leaf of the bridge is operated by two 100 horse power motors with two additional motors in reserve. The new Michigan Avenue bridge had an estimated daily motor car traffic of 30,000 and the lower deck had an estimated capacity of 6000 teams daily. The bridge weighs, both leaves included, about 13,400,000 pounds, with an average load on each of the eight trunnions of 1,675,000 pounds, very probably the heaviest double-leaf double-deck bridge in the world. There was also under construction in Chicago the new Willis Street bridge, weighing 9,600,000 pounds for both leaves and carrying on its upper deck elevated railway tracks. The Michigan Avenue bridge is described in some detail in *Engineering News-Record*, vol. LXXXV, no. 11, Sept. 9, 1920, page 508.

PROPOSED DESTRUCTION OF HIGH BRIDGE. High Bridge, New York City, a masonry arched structure built to carry the first Croton Aqueduct across the Harlem River into Manhattan Island, figured in engineering discussion during the year. The United States War Department in the interest of the river and harbor navigation demanded the removal of this historic structure as an obstruction of navigation and an obstacle to the channel development planned for the Harlem River. The government's demands would be met by the reconstruction of the bridge with larger channel openings and various plans to accomplish this end were proposed and discussed. High Bridge was designed by J. B. Jervis, a construction engineer in the building of the Erie Canal, the Croton Water Supply and the Hudson River R. R. and was considered of rare architectural beauty as well as having served a very useful function. For that reason the American Institute of Consulting Engineers and the New York Chapter of the American Institute of Architects proposed to retain its essential features in a reconstruction which would substitute a single 231-foot span of semi-elliptic form for three of the existing 80-foot arches. With this plan it would be possible to increase the width of the roadway so as to make it a much needed means of communication between Manhattan Island and the Bronx. This plan secured the approval of the United States Engineer Officers, but was opposed by the New York City Department of Plants and Structures which recommended the demolition of the masonry structure and the removal of the alternate piers, replacing the successive pairs of arches by steel plate girder spans masked by a masonry shell in the shape of a flat arch. At the end of 1920 no decision had been reached on the method of meeting the War Department's requirements.

PHILADELPHIA & READING BRIDGE AT HARRISBURG, PA. During the year the Philadelphia & Reading R. R. began the replacement of its wrought-iron deck truss bridge and through plate girder bridge across the Susquehanna River at Harrisburg, Pa., and over the Northern Central tracks with a double-track concrete structure. The project involved the dismantling of the long single-track structure referred to, the strengthening of the old piers, the building of new intermediate piers, and the erection of a

double-track reinforced concrete bridge with 40 arches approximately 76 feet from centre to centre of piers. In addition there will be considerable work done on several of the land bridges and viaducts forming a part of the approaches in the city proper. This work was being done on the Philadelphia, Harrisburg & Pittsburgh branch, which connects with the Lebanon Valley branch passing over the city streets and the Pennsylvania R. R. tracks.

As it was necessary to continue traffic over the older bridge during construction the arch rings were being built in two longitudinal sections. On the completion of the foundations the first section, 13 feet 6 inches wide, was to be built on the down-stream side of the existing bridge. In order to retain the stone fill supporting the track a middle wall of reinforced concrete 2 feet wide was to be built and anchored to the spandrel walls by $\frac{1}{4}$ -inch tie rods. When this section was completed traffic would be transferred to it, and then the old superstructure dismantled and the remaining section of arch rings completed.

This bridge is an important structure as the movement over it consists almost entirely of solid through trains of the Philadelphia & Reading, the Baltimore & Ohio, the Norfolk & Western, the Western Maryland and the Cumberland Valley. Some 75 trains are using the bridge daily, without counting switching movements, and the daily revenue tonnage averages about 140,000. The project is described in the *Railway Age*, p. 869, vol. LXIX, no. 21, Nov. 19, 1920.

OHIO RIVER BRIDGE. Late in the spring the Cincinnati Southern R. R. let a contract for the reconstruction of its Ohio River bridge. As early as 1916 the consulting engineer, Ralph Modjeski, had completed plans for a heavy new double-track structure and tenders were about to be called for, when the work was held up on account of the declaration of war. After the return of the railroads to private hands the leasing line, Cincinnati, New Orleans & Texas Pacific Ry. (Southern) made arrangements to proceed with the Ohio River work, and the contract for furnishing and erecting the superstructure was placed with the American Bridge Co.

On account of traffic and river conditions at Cincinnati the erection of the new double-track structure must proceed without interrupting service over the old spans and without the use of falsework in the river, except for the 300-foot span at the north shore and the lift span (which will replace the former draw span) at the south shore. Therefore two long spans remained to be erected by cantilevering, a 300-foot span built from the north shore span and a 519-foot span from the former and from the lift span. The new steel structure was to be erected on the old piers, the load being distributed by pier columns and pier girders, these supports being encased in a jacket of concrete after erection work is completed. Silicon steel was to be used in all main truss members. The old bridge required special light locomotives to haul trains to the Cincinnati terminus.

NEW B. & O. BRIDGE OVER ALLEGHENY RIVER An interesting and complicated bridge transfer was the replacement of the Allegheny River bridge of the Baltimore and Ohio R. R. at 33rd Street, Pittsburgh. This was successfully completed Dec. 20, 1920, by the employment of a series of rolling and jacking operations. The

new bridge is at a higher level than the old structure built in 1884, an increased head room of 8.4 feet and new spans lengthened to 434 feet and 261 feet, respectively, being required by the United States War Department. Various additions complicated this work and the solution finally reached was to erect and roll into position the new long span weighing 3200 tons a distance of 38½ feet and raising the 261-foot span, which weighed 1200 tons, from a temporary position, a height of 15 feet. Both these were curved Warren trussed spans riveted throughout without sub-panels. This construction and operation are described in the *Railway Age* for May 28 and Dec. 24, 1920.

NEWARK BAY BRIDGE OF THE JERSEY CENTRAL. The mile and a half long timber trestle of the Jersey Central over Newark Bay was being reconstructed under difficult traffic conditions during 1920, with ultimate plans to replace this low-level bridge with a four-track high line of steel and concrete. The reconstruction of the trestle was required by the recent acquisition of some heavy Mikado freight locomotives and involved placing a new deck on the existing bridge in order to bring the entire line up to the modern specifications of loading and speed.

The work was divided into eight independent operations, in each one of which a length of track was to be torn up and rebuilt, while trains in both directions ran around the abandoned section on a single track. A very serious undertaking for a road with so many commutation trains.

The construction of the new steel bridge was to be started as soon as necessary financial arrangements would permit. Such a high-level bridge would allow a large proportion of the harbor traffic to pass underneath without the operation of the draw span, and freedom from this delay, together with the additional tracks, will vastly increase the train-carrying capacity of the line.

BELLE ISLE BRIDGE, DETROIT. Detailed plans for the Belle Isle bridge, prepared by Esselstyn, Murphy and Hanford, engineers, during the year were adopted by the Detroit city council.

The bridge as planned was to be approximately 2200 feet long, with 20 spans 74 feet to 135 long. The total width was to be 88 feet, with 59-foot roadway (asphalt pavement) for six lines of traffic and two 12-foot sidewalks. There was to be no drawspan contemplated, but the structure was to afford an underclearance of 30 feet, sufficient for fire boats and pleasure vessels. The cost of the structure was estimated at \$2,000,000.

MISSOURI RIVER HIGHWAY BRIDGE AT BISMARCK, NO. DAK. Plans were completed in 1920 and contracts let for the Bismarck-Mandan highway bridge across the Missouri River at Bismarck, No. Dak., at a cost of nearly \$1,000,000, both bridge and highway being Federal Aid projects. The structure was designed to consist of three through riveted truss spans of 476 feet, and about 1000 feet of approach consisting of reinforced-concrete deck on wooden piles. The four river piers, spaced 481 feet on centres, required sinking to depths of 50 to 90 feet below low water, passing through sand and silt to a stratum of hard clay shown by borings. The open-excavation method of sinking was planned to be employed on this work, although air was to be used after the piers had been landed, to place the bottom and seal concrete. The two outer piers of the four consist of two 20-foot cir-

cular pedestals 35 feet apart on centres, joined by a connecting member at the top. The two middle piers are 22 x 65-foot rectangles.

SOUTHWARK BRIDGE, LONDON. During the year there was active progress on the reconstruction of the Southwark bridge over the Thames River in London. This famous old structure, built in 1819, consisted of three cast-iron arch spans, the central one of 240 feet and the others of 210 feet each. In each arch there were eight cast-iron ribs, connected by cross-frames and lateral bracing. The new structure erected in its place consists of five steel spans ranging from 123 to 140½ feet. The new project also increased the width of the deck from 42½ feet to 55 feet. (35-foot roadway, two 10-foot sidewalks). Pneumatic caissons were employed in the construction of the new piers, the largest being 30 x 102 feet; an air pressure of 22 pounds was required in sinking them. Differences in construction methods appear when it is stated that in place of 5000 tons of cast-iron in the old bridge, the new represents a total weight of steel of 2000 tons. The old structure is said to have cost £800,000.

In China during 1920 the Ministry of Communications asked for bids for the construction of a heavy modern railway bridge nearly two miles long to replace the existing Hwang-ho or Yellow River bridge of the Peking-Hankow Ry., a structure 9875 feet long. The bridge to be replaced was fabricated partly in Belgium and partly in France, and was formed of both through-truss and deck-girder spans, supported on screw piling, and is only 11 feet above water. The proposed work was to afford a bridge of much greater capacity which it was estimated would cost from \$15,000,000 to \$20,000,000.

BRIEUX, M. See FRENCH LITERATURE.

BRIGHT, JAMES FRANCK. British historian, died at Norfolk, England, October 23. From 1881 to 1906 he was master of University College, Oxford. He was born in London, May 9, 1832, and was educated at Rugby and University College, Oxford. After serving as master at Marlborough College, he became head of the modern department there, holding the position for 16 years; then returned to Oxford, where he became dean of University College in 1874. He played an important part in the development of modern language and history teaching and in connection with the latter began the *History of England*, which grew into a length far exceeding his original plan and became a widely known text. Among his other writings may be mentioned *The Lives of Maria Theresa*, and *Joseph II.*

BRITISH COLUMBIA. A maritime province of Canada on the Pacific Ocean, extending from Alberta to Alaska, with an area estimated in 1919 at 395,610 square miles, and with a population at the census of 1911, of 392,480; estimated in 1919 at about 400,000. The chief cities with their estimated populations in 1919 are Victoria, the capital, 60,000; Vancouver, 175,000; New Westminster, 16,000; Nanaimo, 10,000; North Vancouver, 13,000. The executive authority is vested in a lieutenant-governor, appointed by the Governor-General of the Dominion and acting through a responsible ministry or executive council, consisting of eight members; and the legislative power is vested in a legislative assembly of forty-seven members elected for four years by a universal adult suffrage. The Lieutenant-Governor at the beginning of 1920 was Sir Frank Barnard and the Prime Minister

was John Oliver. See CANADA and ANTHROPOLOGY.

BRITISH EAST AFRICA. The territory on the mainland of Africa comprising the East African protectorate, Uganda protectorate, and Zanzibar. See these articles.

BRITISH GUIANA. A British colony on the northeastern coast of South America, comprising the settlements of Demerara, Essequibe, and Berbice; bounded on the east by Dutch Guiana, on the south by Brazil, on the west by Venezuela, and on the north by the Atlantic Ocean; area (1911), 296,000; estimated Jan. 1, 1919, at 310,972. Many East Indians have immigrated for employment on the sugar estates and as agricultural laborers. By 1918 they numbered 73,557 but no immigration was reported in that year. Land under cultivation was placed at only 197,000 acres in 1919 and the leading products in respect to acreage were rice, sugar cane, and cocoanuts; the chief exports were sugar, rum, and rice; the chief imports were flour, machinery, textiles, and fertilizers. Statistics for commerce, finance, and shipping follow:

	1917	1918
Imports	£3,271,017	£3,835,826
Exports	4,315,939	3,524,798
Revenue	736,473	863,625
Expenditure	733,689	774,481
Shipping	682,906	598,187

BRITISH GUINEA. See PAPUA.

BRITISH HONDURAS. A British crown colony on the coast of Central America, south of Yucatan and 66 miles west of Jamaica; area 8592 square miles; population (1911) 40,458; estimated Jan. 1, 1919, 42,368. In 1918 the birth rate was 41.3 per thousand and the death rate 49.4. Only a small part of the land is cultivated. The chief sources of wealth are mahogany and other forest products. The chief imports of 1918 were gum, cotton and silk piece goods, flour, boots and shoes, and apparel. The chief exports were mahogany, cocoanuts, bananas, gum, and logwood. Statistics for two years follow:

	1917-18	1918-19
Imports	£574,850	£733,620
Exports	550,300	754,867
Revenue	139,141	148,402
Expenditure	138,937	138,012
Shipping *	686,987

* Tonnage entered and cleared.

BRITISH INDIA. See INDIA, BRITISH.

BRITISH NEW GUINEA. See PAPUA.

BRITISH NORTH BORNEO. A British colony in the northern part of the island of Borneo under the jurisdiction of the British North Borneo Company and administered by a governor in North Borneo and a board of directors in London. The area is about 31,106 square miles; population (1911) 208,183, made up chiefly of Mohammedan settlers on the coast and native tribes in the interior. The Europeans in 1911 numbered only 353 and the number of natives has been roughly placed at about 170,000, the main element being the Dusuns. The main foreign element in 1911 was the Chinese who numbered about 26,000. Trade is with Great Britain and the colonies and for the most part through the ports of Singapore and Hongkong.

The chief products are timber and a variety of forest products, camphor, rubber, spices, rice, etc.; and coal, iron, gold, and mineral oil are found. There is a railway from Jesselton on the coast to Melalap, 127 miles long. Statistics for 1917 and 1918 are as follows:

	1917	1918
Revenue	£280,480	£303,063
Expenditure	170,685	191,895
Imports	624,487	761,358
Exports	1,076,073	1,019,094

BRITISH SOMALILAND. See SOMALILAND PROTECTORATE.

BRITISH SOUTH AFRICA. See SOUTH AFRICA, UNION OF.

BRITISH WEST AFRICA. A term including the British colonies and protectorates in West Africa, namely Nigeria (colony and protectorate), Gold Coast (comprising the Gold Coast colony, Ashanti and Northern Territories), Sierra Leone (colony and protectorate), Gambia (colony and protectorate). See these separate titles.

BRITAIN, CARLO BONAPARTE. Naval officer, died April 22nd. He was born at Pineville, Ky., Jan. 16, 1867, and graduated at the United States Naval Academy in 1888. During the Spanish-American war he served on the *Newark*, the *Brooklyn*, and *Badger*. He was in the Philippines from 1900 to 1903 and was in command of the *Massachusetts* in 1910 and of the *Wheeling*, 1911-12. From 1913 to 1915 he was assistant to the Bureau of Navigation. He became chief of staff of the Atlantic fleet, June 30, 1919.

BROCKWAY, ZEBULON REED. American penologist, died at Elmira, N. Y., October 21. From 1876 to 1900 he was superintendent of the State Reformatory at Elmira and had long been one of the best-known penologists in the United States. He was born in Lyme, Conn., April 28, 1827, and he began his work in the service of the Connecticut State Prison, but soon afterwards became superintendent of the penitentiary of Monroe County, N. Y. From 1861, he assumed charge of the House of Correction in Detroit, Mich., remaining there until 1876, when he became superintendent of the Elmira institution. He was celebrated as a prison reformer, chiefly by the introduction at the Elmira reformatory of the indeterminate sentence which was there pronounced successful and which was largely adopted in other prisons. Objections being raised against him on the score of disability due to old age, he resigned in 1900, but subsequently was elected Mayor of Elmira, 1905. He was elected president of the National Prison Association in 1898. He wrote *Fifty Years of Prison Service* (New York, 1912).

BRODHEAD, J. DAVIS. Former congressman and judge, died at Washington, D. C., April 23. He was born at Easton, Pa., Jan. 12, 1859; studied at Catholic colleges and was admitted to the Pennsylvania bar in 1891. In 1907-08, he was member of Congress from Pennsylvania. He then resumed the practice of law and was appointed judge of the Third Judicial District (1914-16). In 1916-17 he was director of the Federal Reserve Bank at Philadelphia, and in 1917-18 served as chief of the Department of Corporation Management under the Trading with the Enemy Act.

BROOKLYN INSTITUTE OF ARTS AND SCIENCES. This institute was founded in 1824 and reincorporated in 1890. It is composed of four departments, namely, the Department of Education, headed by Charles D. Atkins; the Department of Museums, including the Brooklyn Museum, and the Children's Museum, headed by William H. Fox; the Department of Botanic Gardens, headed by C. Stuart Gager; and the Department of Biological Laboratory, headed by Charles B. Davenport. Addresses, lectures, courses of instruction, concerts, and meetings are offered by the educational department. Each year many important men lecture, and eminent artists give concerts. Only very small fees are charged for these opportunities. One of the well-known features of the institute is the School of Pedagogy. The art, ethnology, and natural science departments of the Brooklyn Museum are among the finest in the country. The Botanic Garden stands among the leading botanic gardens of the country. The total membership in all departments at the close of 1920 was 10,739. The total attendance for the season 1919-20 was 762,634. The total receipts for the same year were \$432,644.47, and the permanent funds totaled \$1,069,841.55. During 1920 Mrs. Georgietta Proctor bequeathed \$35,000 to \$40,000 to the Department of Education to be known as the Alfred Waters Proctor Fund. There are branches of the Institute at Jamaica and Huntington, Long Island. Mr. H. Augustus Healy resigned in June, 1920, after having been president for 25 years. Mr. Healy was elected honorary president of the Board of Trustees. Mr. Frank L. Babbott is now president of the Board of Trustees. Headquarters are care of The Brooklyn Academy of Music, Lafayette Ave., Brooklyn, N. Y.

BROUGHTON, RHODA. British novelist, died near Oxford, June 5th. She was born Nov. 29, 1840, her father being a rector and squire in Staffordshire. She passed the greater part of her life at Oxford. Her voluminous writings began with the novel entitled *Cometh Up as a Flower*, which appeared in 1867. She continued to publish at comparatively short intervals throughout her life and a new novel by her was about to appear at the time of her death. Her novels were marked by vivacious and entertaining qualities but never attained literary distinction. They are of value, however, for their clean-cut delineation of the times with which they deal. The earlier stories showed a spirit radical in intent, and perhaps radical in effect at the time, but somewhat mild to modern eyes. By her contemporaries she was rated as high as the Brontës and her novel *Not Wisely but Too Well* which appeared in 1867 was compared with *Jane Eyre*. She had many imitators whose writings were far more insipid than her own, for despite its defects her work showed keen observation and constituted a solid contribution to the history of English manners.

BROUSSON, LOUIS MAURICE. British journalist, died January 1st. He was for many years the editor and manager of the London *Citizen*. Early in his career he interested himself in financial journalism and published a French daily financial paper in London after 1880. He was city editor of many provincial papers and from 1890 to 1904 of the *Financial News*.

BROWN, FRANK. Former governor of Maryland, died at Baltimore February 3rd. He was

born in Carroll County, Aug. 8, 1846. In 1870-76 he was a member of the Maryland House of Representatives, and in 1886-90, postmaster of Baltimore. He was governor, 1892-96. In his later years, he devoted himself to farming and stock-raising on a large scale. In politics he was a Democrat.

BROWN, UNIVERSITY OF. An institution of the higher learning at Providence, R. I., founded in 1764. The enrollment for the fall of 1920 was as follows: Undergraduate men, 965; undergraduate women, 301; enrolled in extension course, 900. The faculty contained 80 members. The productive funds, June 30, were \$5,824,823. The John Hay Library contained 270,000 volumes. Funds were available under the gift of Jesse H. Metcalf for the building of a new chemical laboratory, and plans were under consideration during the year. Funds were also available under the gift of Edgar L. Marston, for the building of the Marston Modern Language Building, for which plans were under consideration. A Soldier's Gateway, a memorial to the Brown men who died in service during the late war, was near completion. It was built of Indiana limestone, and the estimated cost was \$34,000. During the year the gifts received and promised reached the amount of over \$2,500,000. President, William Herbert Perry Faunce, D.D., LL.D.

BROWNE, CHARLES FRANCIS. Artist, died March 30th. He was born at Natick, Mass., May 21, 1859, studied at the Boston Art Museum and at the Pennsylvania Academy of Fine Arts, then in Paris under Gerome and other masters. He taught and lectured on the history of art at the Chicago Institute for many years. He exhibited at the important exhibitions and he was the winner of the Fine Arts Building prize in 1908. From 1912 to 1914 he was president of the Society of Western Artists and from 1913 to 1919 president of the Chicago Society of Artists.

BROWNING, WILLIAM J. Former congressman, died at Camden, N. J., March 24th. He was born at Camden, N. J., April 11, 1850; went into business in 1865 and became a member of the Camden City Council and of the Board of Education; and served as postmaster, 1889-94. He was elected to Congress, November, 1911, to fill out an unexpired term, having previously served for six years as chief clerk of the House, and he was reelected, and remained in Congress from 1913 to 1919. In politics he was a Republican.

BRUCH, MAX. German composer, died at Berlin, Germany, October 3. He was born at Cologne of Jewish parents, Jan. 6, 1838, and in 1863 produced the opera *Lorelei* which was partly set to music by Mendelssohn. From 1880 to 1883 he was conductor of the Liverpool Philharmonic Society and from 1883 to 1890 of the Breslau Orchestral Society, and thereafter lived in Berlin and Bonn. In 1883 he visited the United States and conducted his oratorio *Arminius* at Boston. He was among the leading musicians of Germany in the special field of the epic cantata. The best known of his orchestral works is the *Scenes from the Frithjof Saga* and another well-known work is *Kol Nidrei*. His violin and orchestra concertos were regarded as among the best of their kind. His work includes also chamber-music, in which field he wrote two string quartets and a trio.

BRUNIDI, LAWRENCE. See PAINTING AND SCULPTURE.

BRUSH. DANIEL HARMON. American brigadier-general, died March 8th. He was born in Illinois, May 9, 1848, and entered the Civil War as a private. He afterward graduated from the United States Military Academy, 1871, and passing through the successive grades became inspector-general, March 21, 1904, with the rank of colonel. In 1908 he was raised to the rank of brigadier-general and retired in 1912.

BRYN MAWR COLLEGE. An institution for the higher education of women, at Bryn Mawr, Pa., founded in 1880. The student enrollment in the fall was 470, and there were 64 members in the faculty. The productive funds amounted to \$4,197,676, and the income for the year ending Sept. 30, 1920, was: From productive funds \$127,626; tuitions and fees from students, \$994,175; other sources, \$146,390. The library contained 92,000 volumes. The Bryn Mawr endowment funds for the increase of salaries of the teaching staff during the year ending Sept. 1, 1920, amounted to \$2,191,346 in money and pledges, including a gift of \$100,000 from John D. Rockefeller, jr., to found a Grace Dodge Chair in Industrial Supervision and Employment Management in the Carola Woeris-hoffer department. President, M. Carey Thomas, Ph.D., LL.D., L.H.D.

BUBONIC PLAGUE. The following account of bubonic plague in the United States was published by Dr. W. H. Kellogg, of the California State Board of Health: The first appearance of plague on the North American Continent was in 1900 at San Francisco, when the body of a Chinese, dead of this disease, was discovered in the Chinese quarter. This case was proven bacteriologically to be plague, and the Board of Health of San Francisco, on receipt of the preliminary findings, placed the entire district known as Chinatown, comprising about twelve square blocks, in quarantine, the quarter being roped off and police placed on guard. The disease continued to manifest its presence now and then until a total of 121 cases and 113 deaths had been reached by February, 1904, when the last case of this series was found. In May, 1907, a year after the great fire and earthquake, plague was again discovered in San Francisco. A sailor taken to the Marine Hospital from a tug in the bay was found to be suffering from plague, but he died without being able to give any account of himself, and the tug was lost off the Mendocino coast, thus effectually blocking any further investigation. On August 12th the second case of the second epidemic appeared, followed by 13 others before the end of the month. The epidemic lasted six months, and the total number of cases was 160, with 77 deaths; this time not in the Chinese quarter alone, but scattered all through the city. The last case of the series occurred on June 30, 1908. During the year 1907 seven cases were found in Seattle, Wash. In three years intervening between Feb. 1, 1908, and the end of the year 1915, inclusive, sporadic cases of human plague of squirrel origin occurred in California to the total number of 13 in the counties of Los Angeles, Alameda, Santa Clara, San Benito, Contra Costa, San Joaquin, and Monterey. During the years 1916, 1917, and 1918 no cases of human plague are known to have occurred anywhere in the United States. Extension of the infection to the ground-squirrel population of the rural territory adjacent to San Francisco was first demonstrated in August,

1908, although it is probable that the infection was carried from rats to squirrels in the vicinity of the Port Costa warehouses during the first epidemic in 1900-1904. This probability is indicated by the occurrence of two deaths from plague in widely separated locations in Contra Costa County in August, 1903. The ground squirrels of this State have, therefore, harbored the infection for nearly twenty years, and if it is not eliminated from among them by a very wide and expensive campaign of extermination there seems little room for doubt that a permanent endemic focus has been established. The extent of plague prevalence among the ground squirrels is shown by the Public Health Reports of recent date. For the period of the report, which varies with different counties from a few days to three months, ending July 10, 1920, infected squirrels were found as follows: Alameda County 28, Contra Costa County 46, Merced 1, Monterey 3, San Benito 16, San Mateo 3, San Joaquin 4, Santa Clara 12, Santa Cruz 26, and Stanislaus 2. The figures for the total number of infected rodents found since the beginning of the work in 1907 are startling. In San Francisco the number of rats found was 398, the last one having been discovered in October, 1908, and in Oakland 126 rats, the last one in December, 1908. Alameda County has a record of 431 squirrels, the last being found in September, 1919. Contra Costa County holds the record, the total number of infected squirrels found being 1698.

Following the decade ending with 1918, plague showed a tendency toward recrudescence. In Oakland a series of 13 pneumonic cases occurred in August, 1919, the first of the series having its origin in exposure to plague-infected ground squirrels. This appearance of pneumonic plague in epidemic form, small as was the outbreak, is very disquieting. Plague of squirrel origin seems particularly prone to attack the lungs when transmitted to man, and the danger is that in another such series of cases a sufficient degree of specific organ virulence may be developed to insure the rapid spread of this type. If the conclusions of Teague and Barber are correct, and they appear most plausible, there is much to be feared from this contingency under circumstances permitting extension to some of our Eastern States in winter. It is easily possible for a person, after inoculation by a squirrel flea, to travel to some eastern point, reaching his destination before the onset of symptoms. If now he develops a bubo with a secondary pneumonia, as did the first case of the Oakland series, in the proper climatic surroundings for transmission of the infection, the rôle of plague as a national problem would be immediately recognized. In 1920 the plague occurred in California (one sporadic case of squirrel origin), in New Orleans (three cases in May and June), in Galveston, Texas (two cases), in Pensacola, Fla. (four cases in June and three in July), in Beaumont, Texas (seven cases between June 26 and July 18), and in Port Arthur, Texas (one case in July). Rat examination by the Public Health Service in the above-named cities disclosed a rat epizootic in Pensacola, Beaumont, Galveston, and New Orleans. The disease is present in so many countries now that a list of those harboring it would include most of the nations of the world. In Europe it has been reported recently in Greece, England, Italy, Malta, Russia, and France. In July, 1919, a

dock laborer in Liverpool died of plague, and there is little doubt that the infection prevails among the rats of that city. Human cases have recently been reported from Hawaii, and there was a sharp outbreak in Vera Cruz, Mexico, where it was first discovered in May, 1920. Several cases occurred in Newfoundland.

BUCKLEY, JAMES MONROE. American clergyman and journalist, died February 8th. From 1880 to 1912 he was the editor of the *Christian Advocate* in New York City. He was born at Rahway, N. J., Dec. 16, 1836, studied theology at Exeter and entered the Methodist Episcopal Church in 1858. He remained in the ministry until 1880. Among his books may be mentioned: *Supposed Miracles*; *Midnight Sun*; *Faith Healing*; *Travels in Three Continents*; *Wrong and Peril of Women's Suffrage*.

BUCKWHEAT. According to estimates published by the Department of Agriculture, the buckwheat production of the United States in 1920 was 13,789,000 bushels on an area of 729,000 acres, the average yield being 18.9 bushels per acre. The area was estimated at 10,000 acres less than that of 1919, and the total yield as reduced by 1,455,000 bushels. In 1918, under the stress of war conditions, over a million acres were grown, but since then the acreage has undergone a marked decline. The farm value of the crop on Dec. 1, 1920, was 129.1 cents per bushel, or 17.8 cents less than on the corresponding date the year before but 9.3 cents above the average price on that date for the five years 1914-18. The total farm value of the crop on that date declined from \$22,397,000 in 1919 to \$17,797,000 in 1920 and even \$534,000 below the average for the five-year period mentioned.

Buckwheat is grown commercially in about 23 States but over 60 per cent of the total yield is produced in New York and Pennsylvania. West Virginia, Michigan, and Ohio rank next in importance, but these States produce only about 20 per cent of the country's crop. It is grown mostly east of the Mississippi River; the only western States reporting buckwheat culture on a commercial scale are Iowa, Minnesota, Missouri, and Nebraska. The results of experiments by the West Virginia Experiment Station pointed out the value of Japanese buckwheat as a high yielding variety, and indicated further that buckwheat is not a good nurse crop for vetch, clover, and alfalfa. (West Virginia Experiment Station Bulletin 171.)

BUFFALO, N. Y. See GARBAGE.

BUILDING. In 1920 owing to construction and material costs, comparatively little building was done and there was a great shortage especially in dwellings. High rates for money, high costs of materials, and high costs of labor all contributed to this end and the situation was such that national and State investigation of conditions were held during the year. In New York in particular a peculiarly serious development was discovered which showed conclusively that artificial and to a large degree criminal activities had increased building costs to an inordinate amount even with the unfavorable general industrial conditions. In New York City it was shown that building labor organizations were under the arbitrary control of an individual who was able to extort large sums from those engaged in carrying on operations. Furthermore various sub-contractors were organized into associations which promoted collusive

bidding as not only was demonstrated but admitted by pleas of "guilty" when criminal prosecutions were held. In addition relations were maintained between certain large general contractors and corrupt leaders of labor, thus insuring privileges in the way of regular work and by certain organizations. Finally, what was shown to be a nation-wide situation, material dealers and material manufacturers were so organized that by collusive action in various associations prices were raised to exorbitant figures solely by artificial means, in most cases of doubtful or more than doubtful legality. Such a situation was revealed in New York City by the so-called Lockwood Committee of the State Senate and at a time of housing needs and increasing rentals for dwelling property it struck with particular force. Soon it was realized that it was a more than local condition and there was at the end of the year a general demand for similar investigations elsewhere in the United States and even for a national investigation.

Of course other and even more fundamental reasons existed for reduced building in 1920, which was expected to fall below that of 1919. For the earlier year a report issued by the United States Geological Survey, Department of the Interior, on building operations in the larger cities of the country in 1919, by Jefferson Middleton, was of interest. In this report the number and cost of buildings erected in 128 cities, classified by the character of the principal material entering into their construction are given.

In these cities there were 186,933 new operations, costing \$951,047,495; 131,729 additions, alterations, or repairs, costing \$171,024,832; and 20,846 miscellaneous operations, costing \$15,246,422.

In 141 cities 365,972 permits were issued or buildings erected in 1919, representing a cost of \$1,302,998,607. Approximately the same cities reported 210,538 building operations in 1918, costing \$430,041,365, and the record for 1919 thus shows an increase of 155,434, or 74 per cent, in operations, and of \$872,984,242, or 203 per cent, in cost. The average cost per operation in 1919 was \$3560.

CONCRETE CONSTRUCTION. During 1920 several notable reinforced concrete buildings were under construction in New York City. These were notable for their height and for the fact that this type of construction for high buildings previously had met with comparatively little favor in New York City. A building 16 stories high of this material was designed for erection in the leather district of New York City, just below Brooklyn Bridge at the corner of Gold and Frankfort streets, on a plot 69 x 74 feet, and was to be 189 feet high. This made a record height for such a structure on Manhattan Island, where concrete has been used sparingly and only for lofts and factories. During the year there was also under construction the largest building of reinforced concrete ever built in Manhattan and one of the largest concrete office buildings ever erected. The structure was partly an 11 story office building and warehouse and partly a five story and basement warehouse mainly for the use of the Western Electric Company; and the New York Telephone Company was to occupy the entire block surrounded by Hudson, West Houston, Greenwich, and Clarkson streets, covering an area of 338 x 200 feet. There was to be 583,000 square feet of floor area, and it was to be

throughout of reinforced concrete, with the exception of a veneer of brick on the exterior walls. The cost of the whole operation was said to involve nearly \$3,000,000.

The decline in residential construction in the United States was clearly indicated in the annual statistics compiled by the F. W. Dodge Company, New York. The decline in residential building during 1920 was most conspicuous. In 1919 this class of construction represented 33 per cent of the total, while in 1920 it fell to 22 per cent. The amount of residential floor space contracted for fell off from 240,000,000 square feet in 1919 to 140,000,000 in 1920.

In New York City while there was an increase in building plans filed in 1920, comparatively little was done to provide increased housing. According to the annual report of the Manhattan, New York City, Bureau of Buildings for the year 1920, plans were filed for 783 new buildings costing a total of \$96,199,860, as against 370 buildings costing a total of \$72,283,061 during 1919. The most active month of the year was July, when plans were filed for 141 new buildings. Classification and cost of construction was as follows:

Number	Class	Cost
22	Dwellings	\$1,508,500
22	Tenement houses	13,565,000
48	Stores and lofts	6,836,250
81	Office buildings	44,668,400
23	Manufactories and workshops	500,000
1	Church	60,000
14	Municipal buildings	5,140,000
8	Hospitals	5,350,000
482	Garages	6,348,318
51	Other structures	408,892

Of these new buildings for which plans were filed, construction of 300 was commenced and 253 were completed.

BUILDING OPERATIONS. See BUILDING and ARCHITECTURE.

BUKOWINA. Formerly a crownland in the Kingdom of Austria, to the south of Eastern Galicia, with Russia and East Rumania on the east, and Rumania on the south. On the disruption of the Austro-Hungarian Monarchy in 1918, it was annexed to Rumania. The area according to the census of 1910 when it formed a part of the Austrian kingdom, was 4033 square miles; population in 1913, 818,328. It was formerly represented in the Austrian Parliament by 14 members. In the Rumanian state it was represented in March, 1920, by 19 members and in the Chamber of Deputies by 16.

BUCKNELL UNIVERSITY. An institution of the higher education at Lewisburg, Pa., founded in 1846. The total student enrollment in the fall of 1920, including post-graduates, was 809. The income for the year was \$545,000. The library contained 55,000 volumes. A professor of Spanish and French, a professor of domestic science and two instructors in mathematics and engineering were added during the year. President, Emory W. Hunt, D.D., LL.D.

BULGARIA. One of the Balkan Powers, a constitutional monarchy situated to the south of Rumania and to the east of Serbia. From Oct. 12, 1915, when she declared war against Serbia, Bulgaria was definitely ranged on the side of the Central Powers and she was the first to suffer defeat, surrendering unconditionally in October, 1918. The Czar Ferdinand then abdicated and was succeeded by his son, Boris. See

below, under *Government*; also the article *WAR OF THE NATIONS*.

AREA AND POPULATION. The estimated area in 1917 was 47,750 square miles; estimated population, 5,517,700. No later figures are available than those given in the preceding *YEAR BOOKS*. By the peace treaty of Neuilly, signed Nov. 23, 1919, Bulgaria lost her Aegean coast and ceded Thrace to Greece and the Strumnitza line and a zone on the northwestern boundary to Serbia. The religion is the Greek Orthodox and in 1910 3,643,918 belonged to that communion. The Mohammedans at that time numbered 602,078. Education is subsidized annually by the state to the extent of one-half of the cost of general and two-thirds of the cost of elementary schools. The local authorities pay the remaining cost. Instruction is free and nominally compulsory between the ages of seven and 12. There is a university at Sofia with the four faculties of history and philology, physics and mathematics, medicine, and law.

PRODUCTION, INDUSTRY, AND COMMERCE. The chief occupation is agriculture which engages about five-sevenths of the people, for the most part small proprietors, holding from one to six acres. The principal field crops grown in Bulgaria are wheat, corn, barley, oats, rye, and tobacco. Rice is grown in the southern part of the country, and roses, from which attar of roses is distilled, in certain districts. The harvest seasons for grain are about the same as those in the central latitudes of the United States. It is estimated that there are more than 500,000 farms in the country, but these are for the most part very small. Less than 5 per cent of these farms are 100 or more acres in extent. The soil is of various kinds, including sandy loam, clay, black lands, and heavy gumbo, the last probably being most general. The country is usually rolling or hilly, although a considerable tract of flat land is found on the south side of the Danube and in some of the other river valleys. Modern agricultural machinery, including tractors, are in use in many places. The tractors imported during the last four years or so (perhaps about 50) came chiefly from Germany and Austria. As a rule these tractors have proved to be too large for the requirements of the country. The tractor that would find the readiest market should be of 18 to 25 horse power and suitable for a two or three bottom plow. Tractors are rarely used for hauling in Bulgaria, but are at times used for belt work in thrashing, sawing, and sometimes in mills to take the place of water power when the streams are frozen. See *AGRICULTURE*.

According to the Bureau of Statistics of the Bulgarian government the production of cereals in Bulgaria in 1919 was as follows:

Cereals	Area under cultivation Hectares *	Crop Tons
Wheat	841,717	926,112
Rye	180,406	164,860
Meslin	86,519	94,541
Barley	192,694	225,809
Oats	122,016	107,226
Spelt	7,440	7,523
Millet	13,587	13,847
Maize	563,448	985,296
Rice	1,779	2,396
Buckwheat	26	45
Total	2,008,632	2,527,655

* The hectare = 2.471 acres.

According to estimates, the 1920 harvest showed an increase of about 30 per cent over that of 1919, so that the total crop was expected to be about 3,286,000 tons. As local consumption was estimated at about 1,905,000 tons, there would remain a balance for export of about 1,381,000 tons.

The following information in respect to mineral resources and their exploitation was supplied by the United States Bureau of Foreign and Domestic Commerce in 1920 on the basis of investigations under the British Chamber of Commerce of Turkey and the Balkan States: Since 1878 mining development has been on a restricted scale only and with primitive methods, but that during the past 10 years German and Austrian engineers have carefully studied the ground. Although their reports have been revealed only to the commercial departments at Berlin and Vienna, it is known that "Bulgaria was considered the treasure box of the Balkans for minerals," and German interests were very active for two years prior to the war. In 1918 that country spent considerable sums in deep drilling for coal and other minerals, and in consequence of certain information that leaked out to the public a number of claims (350 in one year) were filed in the Department

former, smelting works erected some years ago were being worked by a French company. In several districts iron and manganese have been discovered, but remain undeveloped from lack of knowledge and financial backing. The same causes have prevented exploitation of gold in the river beds. Deposits of zinc and lead also are numerous and await development. In all these areas sufficient water can be found to generate power in addition to that available from coal and lignite. In the mountainous districts are numerous quarries containing large quantities of granite, marble, lithographic stones, millstones, fuller's earth, fire clay, etc., in great varieties; but these have not received enough attention to determine their importance and classification. Soft limestone from the Rustchuk district is exported to Rumania and is used in Bucharest for buildings. The valuable mineral wealth of Bulgaria "has never been known and it now only needs exploiting; many of the raw materials required in England are to be found in Bulgaria." See PETROLEUM.

COMMERCE. The following table from United States *Commerce Reports* shows imports and exports in 1912 and 1919 by countries of origin and destination:

Countries	Imports		Exports	
	1912 Leva	1919 Leva	1912 Leva	1919 Leva
Austria	51,403,000	194,971	15,523,000	17,605,926
Austria-Hungary	31,771,000		16,409,000	21,273,518
England	5,885,000	104,849,723	41,843,000	140,000
Belgium	43,526,000	3,360	24,584,000	20,918,152
Germany	833,000	302,564	8,383,000	30,953,296
Greece	13,237,000	53,341,143	8,713,000	68,208,257
Italy	13,415,000	345,893,675	1,436,000	12,422,754
Roumania	9,778,000	24,024,832	348,000	2,458,620
Russia	4,543,000	6,674,027	1,594,000	184,800,875
United States	1,790,000	195,111,815	458,000	
Serbia	18,592,000		17,023,000	64,046,030
Turkey	14,998,000	146,995,483	7,568,000	21,401,045
France	2,518,000	5,779,772	1,460,000	
Netherlands	2,816,000		343,000	1,010,550
Switzerland	1,603,000	11,203,000	3,000	
Sweden and Norway				
Spain		22,625,987		
Poland				12,804,248
Czechoslovakia		89,346,696		80,921,850
Yugoslavia		7,118,545		1,751,861
All other countries	1,902,269	480,642	10,718,624	11,541,970
Total	213,110,269	963,941,235	156,406,624	552,253,452

of Mines. Between 1900 and 1919 the claims filed for minerals and quarries totaled 3514. Up to 1912, 40 concessions were granted, covering an area of 13,174 hectares.

Since 1912 many concessions for lignite and oil schist areas have been granted. In 1916 Germany "carefully explored these areas and large samples of lignite were sent to Berlin for testing and briquetting," the average calorific value proving between 2300 and 4500. The Pernic (government) areas—25 miles long and 8 miles wide—contain the best lignite fuel. Their future productivity is estimated at 4000 tons per day, six days a week, and 52 weeks a year, for 500 years. The Sofia district also has numerous areas rich in lignite and bituminous coal. The latter is found in a basin 40 miles square lying some 50 kilometers west of Sofia. Seams have been exposed ranging from 3 to 10 meters in thickness. While the coal analyzes from 7000 to 8500 calories, it crumbles so easily as to require briquetting. Placalnitz, 70 kilometers west of Sofia and Burgas, on the Black Sea, contain several rich copper deposits. At the

From the above table it can be seen that the United States ranked 10th in supplying Bulgaria's imports in 1912 and second in 1919. As a market for Bulgarian products the United States ranked ninth in 1912 and first in 1919.

FINANCE. The Finance Minister made the following report on the financial situation in 1920: There had been a deficit in every budget since 1911. In 1914 the deficit was 68,000,000 leva; in 1915, 99,000,000; in 1916, 853,000,000; in 1917, 1,185,000,000; in 1918, 1,499,000,000; in 1919, 686,000,000. The total deficit during the war was 5,000,000,000; the consolidated debt in 1920 was 555,000,000 and the non-consolidated 462,000,000. The indebtedness of the government to the National Bank of Bulgaria amounted in 1920 to 2,949,000,000 leva; moreover, Bulgaria owed an indemnity of 2,260,000,000 gold francs. For 1919 and 1920 the government expended for ordinary general expenditures 1,205,705,000 as against receipts of 819,000,000 leva, not including the military credits, so that the deficit would reach the sum of 1,100,000,000 leva. The expenditures to be covered for the fiscal year 1920-21

amounted to 3,000,000,000 leva. In spite of this all the needs of the government were not provided for. The government had been unable to find new revenues. Recovery was difficult on account of the exhaustion of its national industries. The budget would show a deficit of 200,000,000 leva. To increase the revenues the government would increase direct taxation.

In Bulgaria all parties in preparing their budgets had always endeavored to spare as much as possible the agricultural class, which forms almost 90 per cent of the population. This was especially true of the Agrarian party, which in 1920 was in full control of the government.

DEFENSE. The peace strength of the army before the war was about 59,900 officers and men. Its strength during the war was about 500,000 men. The armistice was granted Sept. 30, 1918, and demobilization followed at once. The treaty of Neuilly, Oct. 27, 1919, limited the total military forces in the future to 20,000 men and prohibited any measures of mobilization. It permitted the voluntary enlistment of a frontier guard of 3000 men and aside from these it limited the number of police, customs officials, gendarmes, etc., to 10,000. The possession of military or naval aircraft was forbidden; the importation and exportation of munitions of war were prohibited; and the manufacture of arms and munitions was to be confined to a single factory under state control. As to the naval forces, Bulgaria had to surrender all warships and submarines and was allowed to retain only a few torpedo-boats and motor-boats on the Danube and along the coast.

GOVERNMENT. The executive power is in the King and a Council of Ministers nominated by him. The legislative power is in a single chamber called the Sobranje, whose members are elected by universal manhood suffrage for four years, though the chamber may be dissolved at any time by the King. The King's consent is necessary to the measures passed by the Sobranje. There is also a special large assembly known as the Grand Sobranje containing twice as many representatives as the regular assembly, which is elected in the same manner and has to do with all questions involving changes in the constitution, the acquisition or cession of territory, and vacancies on the throne. Boris III succeeded on the abdication of his father, Oct. 4, 1918, and a new cabinet was appointed Oct. 14, 1919, which as reconstituted in April, 1920, comprised the following members: Prime minister, Minister for Foreign Affairs, and Minister of War, M. Stambulinski; Minister of the Interior, M. Dimitroff; Minister of Justice, Dr. Djidroff; Minister of Commerce, M. Athanasoff; Minister of Agriculture and Minister of Finance, M. Daslakiff; Minister of Public Works, Alexander Stambolisky; Minister of Posts and Railways, M. Torlakoff; Minister of Education, M. Kaloff. The election to the Sobranje on March 31, 1920, returned the following representatives of the various parties: Agrarians, 1200; Advanced Socialists, 50; Moderate Socialists, 39; Democrats, 39; Popular Party, 19; Radicals, 8; Progressives, 8; National Liberal, 1.

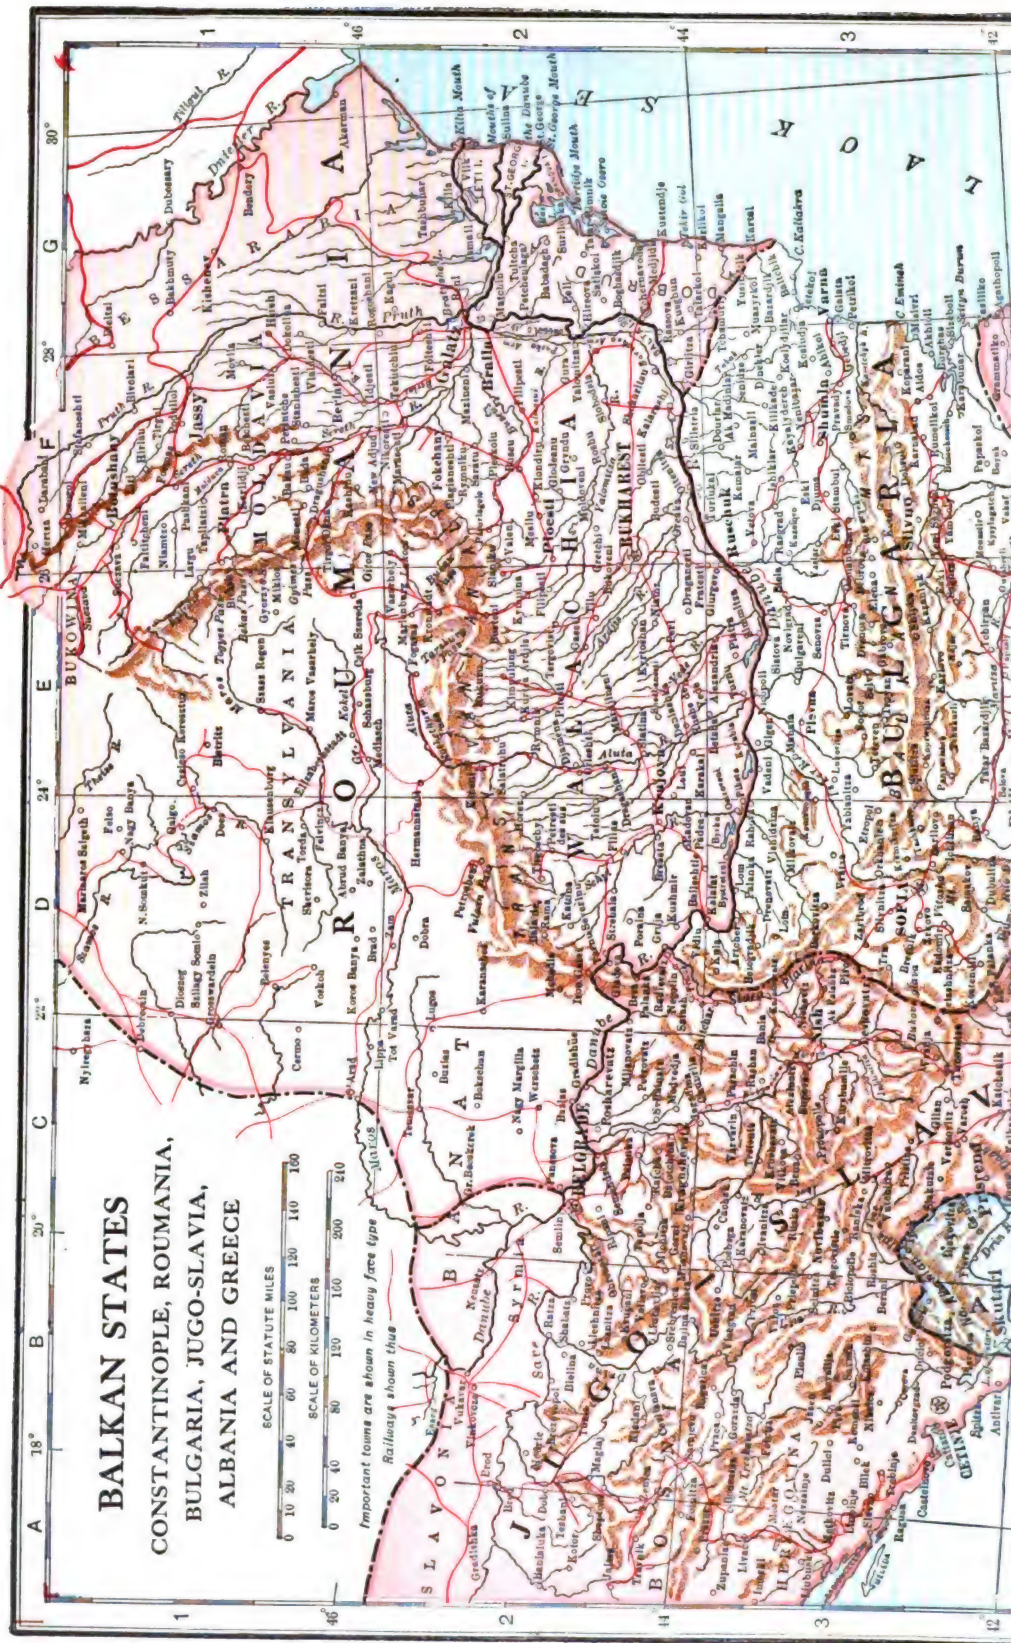

THE TREATY. As was said in the last YEAR BOOK, the treaty with Bulgaria was signed at Neuilly near Paris, November 27. The chief territorial and political clauses were as follows: The cession to the principal Allied and associated Powers of Thrace to dispose of as they saw fit,

but with the assurance that Bulgaria should have an economic outlet to the Aegean Sea; slight change of the western frontier to the advantage of Serbia; addition to Bulgaria of a small tract of Turkish land; the question of the cession to Roumania of the Bulgarian port of the Dobrudja to be left open; Bulgarian recognition of the independence of Jugo-Slavia; protection of racial minorities. The principal military features were the surrender of warships, etc.; the demobilizing of the army, and its limitation in the future to 20,000 men; the limitation of the manufacture of war material. The essential point in the financial terms was the payment as reparation of \$445,000,000. As among the other Central Powers, there was great dissatisfaction with the terms of the treaty and they were regarded as a violation of the principles laid down by President Wilson. Prominent Bulgarians declared that every one of the Fourteen Points had been violated or disregarded. It was said, for example, that it was a gross violation of both spirit and letter that Macedonia with a Bulgarian population of 1,250,000 should be handed over to Serbia and Greece; that the Dobrudja should be handed over to Roumania when the Roumanian population was less than 7000 out of a total of 275,000; that Thrace, where the overwhelming majority was Bulgarian and Turk, should be given to Greece; and that a strip of land containing a Bulgarian population of 92,000 and no Serbians should be annexed to Serbia. There was also much complaint of the severe financial burdens laid upon the country by the treaty. Bulgaria had to pay an indemnity of 2,250,000,000 francs in gold which at the normal rate of exchange would be \$450,000,000. The financial situation was made worse by the low rate of exchange. The treaty was characterized as blundering and vindictive in that it imposed a burden too heavy for the country to bear and at the same time took away valuable territories which might have helped her to pay it. Nevertheless, the government repeatedly professed its intention to carry its terms out faithfully.

ELECTIONS. Elections to Parliament were held March 28. Already in January the government was weakened on account of industrial unrest and movements against the dynasty. The elections reduced the Socialist representatives from 39 to 9. The distribution of seats among the party groups was as follows: Agrarians, or Peasants' party, 110; Communists, 50; Democrats, 23; Populists, 16; Socialists, 9; Progressives, 7; Radicals, 7; Liberals, 3; Ghenadievists, 3. On April 10th, when the new Parliament opened, the Prime Minister, Stamboulinsky, announced the resignation of the non-Agrarian members of the Ministry. The ministerial programme emphasized the need of pushing actively the work of reconstruction and the willingness of the government to resume coöperation with the former enemies.

Municipal elections in October did not reveal any marked change in the relative strength of parties. In the country districts the peasants prevailed and in the towns the strength of the Communists, Democrats, and Liberals remained about the same. A congress of the Macedonian Societies was held at Sofia in October. It declared for social and political solidarity while requiring the strict observance of the treaty.

RECONSTRUCTION. The reconstruction of the country had proceeded satisfactorily since the

end of 1918. Late in 1919 the farmers' party came into power under the prime ministry of the leader of that party, M. Stamboulinsky, and important measures were taken to promote production. The chief of these was the law for labor conscription which provided that all men over 20 and women over 18 years of age were subject to compulsory labor. The purpose of the law was to make the best possible use of social forces in order to increase production, and to elevate the people morally and economically by giving them the sense of duty to society as a whole. Another measure appropriated to the state for public use the surplus land of individuals who could not cultivate it themselves. After the loss of so large a part of the territory inhabited by Bulgarians, a large number of the natives sought refuge in Bulgaria and the government had to find a way of providing for some 300,000 of these newcomers. On May 22, 1920, a law was passed against speculation and profiteering, which limited profits to 8 per cent wholesale and 20 per cent retail, and which made certain allowances on behalf of the peasant co-operatives. This led to the criticism in certain quarters that the government showed Bolshevik tendencies. Bulgarian officials, however, denied any such tendencies, holding that the measures taken were necessary for the provision of the requisite production. Elaborate reports on the industrial needs of the natural resources of the country were prepared and distributed among the foreign representatives. In these it was made plain that for two years before the war Germany had practically controlled all the natural resources of Bulgaria. During the year it was reported that foreign engineers were making frequent discoveries of new deposits of lignite and oil and that there were great resources of stone and building materials in the mountain districts, which required only capital for their profitable development.

OTHER EVENTS. There was much discussion of the government's attempt to carry certain laws against foreign or local propaganda which aimed at the overthrow of the present order. Out of the 230 members of the chamber, there were 50 who declared themselves Communists, but it was argued that Bulgaria was not the kind of a country that stood in danger of Bolshevism for it had only a small urban industrial population, the chief element in the population being peasants with small holdings. In the course of the year attempts were made from time to time to bring about more cordial relations with Roumania and Jugo-Slavia, but down to the end of the year nothing had come from them. The Prime Minister was known as a champion of Balkan unity and had many times urged the forming of a Balkan confederation. One of the obstacles to this was the bitter hatred on the part of certain elements in Serbia. Another was the resentment caused by Serbia's and Roumania's treatment of the Bulgarian majorities in the territories acquired by them as a result of the war. According to the published reports, the King was popular and the government in 1920 possessed the confidence of the majority. At the same time there was a danger from the long standing rivalry among the many party groups. On September 19th, the 35th anniversary of the union of Southern and Northern Bulgaria was celebrated. At this time there was much discussion arising from the demand of the Reparation Com-

mission that some 500 Bulgarians' accused of committing atrocities should be delivered for punishment in the courts of Serbia, Roumania, and Greece. Much resentment was expressed in the newspapers. See **WAR OF THE NATIONS**.

BULLEN, ARTHUR HENRY. British Elizabethan scholar, died at Stratford-upon-Avon, February 29. He was born in 1857 and devoted himself at an early age to the study of Elizabethan dramatists. He shared this interest with the poet Swinburne with whom he was on intimate terms until Swinburne's death. The most generally admired of his works are his lyrics from the Elizabethan song books and his edition of Thomas Campion whose works had been practically forgotten for 300 years. Upon the revival of the *Gentleman's Magazine* he received the offer of the editorship.

BURCH, CHARLES SUMNER. Bishop of New York, died in New York City, December 20. In September, 1919, he had been appointed bishop to succeed Bishop Greer. He was born at Pinckney, Mich., June 30, 1855, and graduated at the University of Michigan. After working on newspapers in Detroit and Chicago he was editor and manager of the Grand Rapids *Evening Press* for nine years. Meanwhile he devoted himself to the church and in 1905 after taking his course in the Western Theological Seminary at Chicago, he was ordained priest. He studied in Germany and at Oxford, England. He was rector of St. Andrew's Church, Staten Island, 1905-11, and consecrated suffragan bishop of New York, Feb. 24, 1911. During his pastorate on Staten Island he interested himself greatly in missionary work among the Italian communities and among the prisoners in the city prisons of New York. As a bishop he applied great energy to hasten the work upon the uncompleted cathedral.

BURDETT, Sir HENRY. British author and statistician, died April 29. He was author of *The Hospital*. He was born March 18, 1847, and served as superintendent of Queen's Hospital, Birmingham, and the Seaman's Hospital, Greenwich. The list of his writings on subjects of finance, taxation, hospital administration, sanitation, etc., is too long to be given here. They include many works on the training of nurses and on the housing of the poor and other matters pertaining to public health and welfare; 17 volumes of *Burdett's Official Intelligence*; *British-American Foreign Securities*; four volumes on *Hospitals and Asylums of the World*; *Burdett's Hospitals and Charities*; a *Year-Book of Philanthropy*, etc.

BURDICK, FRANCIS MARION. Professor of law, editor, and author, died at De Ruyter, N. Y. He was born Aug. 1, 1845; graduated at Hamilton College, 1869, and after editing a Utica newspaper, practiced law in that city, 1876-83. He was professor of law at Cornell College, 1897-01, and then went to Columbia University, where he was professor of law and member of the University Council till 1916, when he became professor emeritus. He was prominent in various legal associations and was the author of a number of important law texts, as well as an editor in the Department of Law on works of reference, including the *Johnson's Universal Cyclopædia* and the *NEW INTERNATIONAL ENCYCLOPEDIA*.

BURKE, TOM. See **MUSIC, Artists, Vocalists.**

BURMA. The largest and most easterly province of British India; area about 231,000

square miles; population (1911), 12,115,217. It is separated from China by the Shan States. The population comprises nine racial groups of which the Burman is the chief, Burmese being the language spoken by about 8,000,000 of the inhabitants. Agriculture is the chief occupation. Rice is grown everywhere and is the principal export. Other leading exports are petroleum products, teak and other woods, and cotton. In 1919 the export of rice and paddy amounted to \$78,315,362, a considerable excess over the previous year. The petroleum products exported in 1919 totaled 158,791,000 gallons of mineral oil and 138,050 hundredweight of paraffin and other products. The value of the exports of petroleum products was nearly \$24,000,000. The chief imports are cotton piece goods, jute manufactures, cotton twist and yarn, and metals. Cotton piece goods exported in 1919 were valued at \$16,926,985. The total imports for 1918 were valued at \$82,530,271. The capital of Lower Burma is Rangoon, with a population of 293,316; of Upper Burma, Mandalay, with a population of 138,299. Sir Reginald Henry Craddock was Lieutenant-Governor in 1920.

BURROWS, RONALD MONTAGU. British educator and scholar, died May 14. He was born at Rugby, England, and educated at Oxford where he took honors. He was professor of Greek in the University of Manchester from 1908 to 1913. Besides articles in the classical journals, he published volumes on *Florilegium Tironis Graecum* (1904) and *The Discoveries in Crete* (1907).

BURY, WILLIAM. British clergyman, died April 1. At the time of his death he was Canon of Petersborough. He was born in 1839 and educated at Cambridge where he took honors and where he was prominent in athletics. He devoted himself for many years to the improvement of the poor law and to measures of coöperation on behalf of the small consumer. He wrote various pamphlets and volumes on charity, the poor law, and outdoor relief.

BUTTER. See DAIRYING.

BUTTZ, HENRY ANSON. Clergyman, died at Madison, N. J., October 6. He was born at Middle Smithfield, Pa., April 18, 1835, and entered the Methodist Episcopal ministry in the same year. He held pastorates at several New Jersey cities, but later devoted himself to teaching. From 1867 to the time of his death, he was a member of the faculty at Drew Theological Seminary, where after 1871, he was professor of Hebrew, Greek, and Exegesis, and of which he was president from 1880 to 1912. After 1912, he retired with the title of president emeritus. He was a member of the missionary and other associations of the church. He published Commentaries on the Epistles to the Romans, and various articles on critical subjects, and edited theological works.

BYRON, OLIVER DOUD. American actor, died at Long Branch, N. J., October 22. He was born in 1842. He was one of the best known of the older actors and his last appearance before his death was in *General John Regan* in 1915. He had appeared at the age of 14 in *Nicholas Nickleby*. One of his famous rôles was that of Romeo in which he appeared along with Mrs. Scott Siddons, but his most marked success was the leading rôle in the play called *Across the Continent* which began in 1870 and continued for about 22 seasons, having a longer duration than

almost any other leading rôle played by an actor in America.

CALIFORNIA. POPULATION. According to the preliminary report of the census of 1920, there were 3,426,861 residents in the State Jan. 1, 1920, as compared with 2,377,549 in 1910.

AGRICULTURE. According to the census of 1920, the number of farms was 117,690, an increase of 33.4 per cent since 1910. The following table is compiled from the estimates of the United States Department of Agriculture, covering the years 1919 and 1920:

Crop	Year	Acreage	Prod., bu.	Value
Corn	1920	90,000	8,150,000	\$3,780,000
	1919	90,000	2,970,000	5,316,000
Oats	1920	175,000	5,425,000	4,340,000
	1919	175,000	5,250,000	5,040,000
Wheat	1920	650,000	9,100,000	16,380,000
	1919	990,000	16,335,000	33,323,000
Barley	1920	1,250,000	28,750,000	28,750,000
	1919	1,000,000	30,000,000	42,300,000
Hay	1920	2,355,000	*5,182,000	102,200,000
	1919	2,355,000	*5,092,000	86,553,000
Oranges	1920	*18,700,000	51,425,000
	1919	*15,075,000	41,456,000
Rice	1920	162,000	9,720,000	11,761,000
	1919	155,000	9,300,000	24,831,000
Beans	1920	285,000	2,850,000	9,405,000
	1919	400,000	5,000,000	21,750,000
Potatoes	1920	95,000	13,015,000	19,522,000
	1919	85,000	11,050,000	18,896,000
Sweet potatoes	1920	8,000	1,056,000	1,690,000
	1919	8,000	1,080,000	1,933,000
Cotton	1920	298,000	*150,000	22,500,000
	1919	185,000	*56,000	12,063,000
Hops	1920	12,000	*21,000,000	7,350,000
	1919	11,000	*17,875,000	13,764,000

* Tons. † Boxes. ‡ Bales. § Pounds.

The Agricultural Statistician for California reports for December 5th about 45 per cent of the 1920 rice crop of that State thrashed, 30 per cent still in shock, and the remaining 25 per cent still uncut, with a probable loss in sight of 2,500,000 bushels of the estimated production, due to the continuous rains. See AGRICULTURAL EDUCATION; AGRICULTURAL EXPERIMENT STATIONS.

MINERAL PRODUCTION. The estimates of the United States Geological Survey of output of mineral production in 1919 and 1920 were as follows:

Gold, dollars	Silver, ounces	Copper, lbs.	Lead, lbs.	Zinc, lbs.
1920—				
14,305,300	1,513,495	12,934,900	5,071,600	1,572,500
1919—				
16,695,955	1,107,189	21,732,507	3,568,267	472,990

The outstanding and unprecedented feature of metal-mining in California in 1920 was the closing down of a great number of the largest gold and copper mines, and the conditions generally were decidedly adverse, particularly in the Mother Lode region, where some of the mines that were once among the largest in the State stopped work, several of them permanently. Another feature of the year was the restriction of the supply of power by hydro-electric companies in the fall, which affected the deep mines of all classes as well as the dredging companies. For lack of this usual power some mines had to close altogether and others were compelled to restrict operations. When the first fall rains commenced, in October, the supply of power was at once restored. The hardships suffered by the gold miners in the foothill and mountain counties partly depopulated towns and camps and

even counties. Numerous mines were allowed to fill with water, and some reduction plants were virtually abandoned. The labor available in the mining regions of the State is reported at the end of the year to be still unsatisfactory, and its high cost and inefficiency were the principal causes of the closing down of many large mines and of the curtailment of operations in others, although other high costs contributed to reduce production. Prospecting was almost stopped in the older mining regions, and very few large mining enterprises were started.

Of the total gold produced in the State in 1920, 52 per cent was obtained from deep or lode mines and 48 per cent from placers. The dredges were producing 96 per cent of the placer gold, or 46 per cent of the gold output of the State. There seemed to be a small continuous decrease in the percentage of gold produced by the deep mines and a corresponding increase in the percentage produced by the placers. Of the gold produced by deep mines the larger proportion was derived from siliceous ore, but some was derived from copper, lead, and zinc ores. The dredges were increasing their percentage of the total output of gold, but the hydraulic, drift, and sluicing mines were steadily decreasing their percentage.

The increase in the silver output was somewhat surprising in view of the fact that the largest copper smelters in the State were closed down during the year, for a considerable part of the silver produced is usually obtained from copper ores. But there was an increase in the output of lead and lead-silver ores in Southern California, with consequent increase in silver from those sources. Moreover, the California Rand mine, in San Bernardino County, continued to ship high-grade ore during the year, making a material increase over its normal output. The great decrease in the estimated output of copper was due to the closing of the most productive mines in the State. The increase of lead was due entirely to the production of one mine in Southern California that reported no output in 1919. Moreover, a number of lead and silver-lead properties, mainly in San Bernardino and Inyo counties, began or increased production in 1920. Nevertheless the output of lead in California was still far below normal, as that in 1918 was over 13,000,000 pounds. Zinc was produced at only a few mines in the State, all in Inyo County.

FINANCE. According to the report of the State controller, total receipts during the fiscal year 1919-20 were \$58,742,199.34 and disbursements for the same period were \$61,908,139.73. The assessed value of taxable property on July 1, 1920, was \$4,555,445,447. The net bonded indebtedness on June 30, 1920, was \$50,259,500.

STATE INSTITUTIONS. The total number of inmates in State institutions on Jan. 31, 1921, was 10,317. This was distributed as follows: Industrial Home for Adult Blind, 141; State Reform Schools, 792; State Hospitals for the Insane, 10,616; State Home for Feeble-minded, 1449; State Prison, 2993.

LEGISLATION. No legislative session was held during 1920, but at the general election in November several important constitutional amendments and initiative and referendum measures were adopted. An initiative anti-alien land law, intended to restrict Japanese land ownership, was approved by an overwhelming vote. The

measure was supported by the governor and State Board of Control, which completed earlier in the year an exhaustive study of the Oriental problem in California. (See below.) Other initiative measures approved provided for an increase in teachers' salaries and a procedure for facilitating the sale of State highway bonds. Constitutional amendments were approved providing for extending State aid to families in which the father is incapacitated for gainful work, exempting orphans from taxation and levying a poll tax on aliens. Two referendum measures relating to narcotic drugs and irrigation districts were also approved.

Among proposals defeated were measures relating to prohibition enforcement, a proposal for a constitutional convention, the single tax, absent voters, prohibiting vivisection and vaccination, and a millage tax for the State university.

ELECTIONS. The vote for President was as follows: Harding (Republican), 624,992; Cox (Democrat), 29,191; Debs (Socialist), 64,076; Watkins (Prohibitionist), 25,085; as compared with the following vote in the presidential election of 1916: Wilson (Democrat), 466,289; Hughes (Republican), 462,516; Benson (Socialist), 43,263; Hanly (Prohibitionist), 27,713. In the election for United States Senator the vote was as follows: Shortridge (Republican), 447,835; Phelan (Democrat), 371,580; Edwards (Prohibitionist), 57,768; Beals (Socialist), 36,545. The Prohibition Enforcement act and the acts prohibiting vivisection or compulsory vaccination were defeated.

ALIEN LAND LAW. On November 2nd, the referendum on the anti-Alien Land Leasing Law resulted in a vote for acceptance by a majority of 446,397, the figures being 668,483 against 222,086. The State governor declared the act in force on December 10. The acting governor intimated his intention to exercise his full constitutional power in its enforcement. The main object of the act was to prevent Japanese from owning agricultural land in California or controlling it when it belonged to their children born in the United States. Its effect was to render it impossible for the 60,000 to 70,000 Japanese in the State to lease land in their own right, or on behalf of their children. The leading arguments for and against this measure and some account of the difficulties to which it gave rise will be found in the articles, JAPAN and WAR OF THE NATIONS.

OFFICERS. Governor, William D. Stephens; Lieutenant-Governor, C. C. Young; Secretary of State, Frank C. Jordan; Controller, John S. Chambers; Treasurer, Friend Wm. Richardson; Attorney-General, U. S. Webb; Surveyor-General, W. S. Kingsbury; Adjutant-General, J. J. Borree; Superintendent Public Instruction, Will. C. Wood; Commissioner of Corporations, E. C. Belows; Librarian, Milton J. Ferguson; Legislative Counsel, Arthur P. Will; President Railroad Commission, Edwin O. Edgerton; Chairman Industrial Accident Commission, Will. J. French.

JUDICIARY. Supreme Court: Chief Justice, Frank M. Angellotte; Associate Justices, Lucien Shaw, William P. Lawlor, Curtis D. Wilbur, Thomas J. Lennon, Warren Olney, Jr., W. A. Sloane. See ANTHROPOLOGY.

CALIFORNIA, UNIVERSITY OF. A co-educational institution at Berkeley, Cal., founded in 1860. The number of students registered down to November 10th was given as approximately

11,151 (allowing for duplications), of whom 6239 were men and 4912 were women. The total registration for all departments connected with the university, including those which did not give degrees, was 37,480. The degree-giving departments were as follows: College of Letters and Science; College of Commerce; College of Agriculture; College of Mechanics; College of Mining; College of Civil Engineering; College of Chemistry; School of Jurisprudence; School of Architecture; Medical School; Hastings College of the Law; College of Dentistry; California College of Pharmacy; Junior College Department (Southern Branch, Los Angeles); Hooper Foundation for Medical Research. The departments that did not give degrees were as follows: Teachers' Curricula, Los Angeles; Los Angeles Medical Department; Summer Sessions, 1920; University Farm School, Davis; University Extension; Agriculture Extension. The teaching staff for the year 1920 numbered 852 and the administrative officers, 60. The library contained 420,525 volumes. President, David Prescott Barrows, Ph.D., LL.D. The number of new appointments of all classes including those for the replacement of persons resigning or declining appointment for the fiscal year 1919-20, or any portion of it, was 391. Of these, 3 were to full professorships, 7 to associate professorships, and 20 to assistant professorships. Total of the income-earning endowments, \$6,246,496; income for 1920 including State appropriations of \$2,722,904. \$5,844,464.

CALLAGHAN, Sir GEORGE ASTLEY. Admiral of the British fleet, died in London, England, November 23. As commander-in-chief of the Home Fleet and in other important capacities, he had had a distinguished career. He was born Dec. 21, 1852, and attained the rank of captain in 1894. After commanding in succession a number of battleships, he headed the naval brigade in China for the relief of the legations in Peking after the Boxer uprising in 1900. He was made rear-admiral of the home fleet in 1906 and he commanded the second division of the Mediterranean fleet in 1908-10 and of the home fleet in 1910-11. From 1911 to 1914, he was commander-in-chief of the home fleet and in 1917 he was made admiral of the fleet. To him was given credit for the efficiency of the great fleet when it was turned over to Lord Jellicoe, Aug. 4, 1914. He had brought the training and discipline during his long experience to a high point of perfection. In July, 1914, he was in command during the test mobilization of the fleets. After 1915, he was commander-in-chief of the Nore.

CAMBODIA. A native kingdom of Farther India constituting a French protectorate and forming part of French Indo-China. For area and population see the article FRENCH INDO-CHINA. The capital is Pnom-Penh, with a population of 62,255. The chief products are rice, betel, tobacco, pepper, spices, etc. In late years the growing of cotton has extended. Salt is found in commercial quantities. The exports include salt-fish, tobacco, cotton and rice.

CAMEROON. See KAMERUN.

CAMP FIRE GIRLS. An association founded by Dr. and Mrs. Luther H. Gulick in 1912 for the general purpose of promoting good health by outdoor life, encouraging economy, and effecting social improvement. It is an organized effort to find "romance, beauty, and adventure in everyday life." It seeks to make the homely task con-

tribute to the joy of every-day living. Camping out is a regular feature of the programme each year. A group, consisting of from six to 20 girls, with a "guardian," is called a Camp Fire. The guardian must be at least 18. Each member pays one dollar annual dues which goes toward the support of the National Headquarters at 31 E. 17th Street, New York, maintaining workers in the field, and supplying the guardians with monthly bulletins of instruction. Each Camp Fire and each Camp Fire Girl has a name and a symbol. Ceremonial meetings are held once a month. The official organ of the Camp Fire Girls, *Everygirl's Magazine*, is published monthly in New York. Miss Rowe Wright is editor.

Camp Fire Girls consider their personal health a sacred thing. During the past year more than 80,000 Camp Fire Girls carried out this point of the law by camping in the open for one or more weeks. The second point of the law, "Give service," was followed by 35,000 girls who maintained gardens, and 50,300 who contributed money and coöperated with the Red Cross. The Camp Fire programme is especially adaptable for girls' work in schools and churches, and it is now being adopted by various denominations as the official programme for the "between-Sundays" activities of the girls. In their Reconstruction Programme, endorsed by prominent educators throughout the country, they pledge themselves to conserve health and become sturdy and rugged, to create wealth for self and country by saving, and to reestablish the old-fashioned womanhood by making the home more beautiful and happy. Membership is approximately 150,000 divided into 7000 groups in every State and in 16 foreign countries.

CANADA. A British dominion in North America lying between the United States on the south and the Arctic Ocean on the north and extending from the Atlantic to the Pacific. Capital, Ottawa.

AREA AND POPULATION. The total area is 3,729,665 square miles, of which 125,745 are water area. It is divided into nine provinces and two territories. The total population at the census of June 1, 1911, was 7,206,643; estimated March 31, 1917, 8,361,000, of whom 105,998 were Indians and 3296 Eskimo. For details by provinces and territories and for distribution by race, color, and sex, see the *YEAR BOOK* for 1917. During the year ending Nov. 30, 1919, the immigrants numbered 114,768. (See below under *History*.) The cities over 100,000 in 1911 were Montreal (470,480); Toronto (376,538); Winnipeg (136,035— in 1916, 163,000); Vancouver (100,401). Ottawa in 1911 had a population of 87,062.

AGRICULTURE. The total value of the fields was estimated at \$1,453,000. The tables on opposite page taken from *Statesman's Year Book* for 1920, give the estimates of crops by provinces in 1919.

Canada's harvest for 1920 was estimated at 25,000,000 tons of hay and corn and 1,250,000,000 bushels of other field crops. The average price of 1920 wheat was estimated at \$2 per bushel. The field crops of Canada represented about \$170 per head of population. The wool yield was placed at 18,000,000 pounds, as compared with 17,300,000 pounds in 1919. The fisheries of Canada were placed at over \$40,000,000, and the forest products exported at \$80,600,000.

The values of the farm produce of Canada for 1920 (with the corresponding figures for 1919 in

parentheses) were given as follows: Wheat, \$420,636,000 (\$360,573,000); oats, \$394,112,000 (\$317,097,000); barley, \$97,513,226 (\$77,162,700); rye, \$17,680,000 (\$14,240,000); peas, \$10,227,000 (\$9,739,300); beans, \$7,214,520 (\$6,214,800); buckwheat, \$16,944,000 (\$15,831,000); mixed grains, \$49,883,522 (\$37,775,400); flax, \$23,473,200 (\$22,609,500); corn, \$27,326,000 (\$22,080,000); potatoes, \$148,380,000 (\$118,894,200); carrots, turnips, and other vegetables, \$59,827,600 (\$54,958,700); hay and clover, \$389,606,200 (\$338,713,200); fodder corn, \$51,162,200 (\$34,179,500); sugar beets, \$3,200,000 (\$2,606,000); alfalfa, \$12,504,330 (\$10,800,200); cheese, \$41,950,000 (\$39,457,358); butter, \$45,376,200 (\$41,845,164); live stock, \$87,620,200 (\$83,472,000). See AGRICULTURE.

FOREST PRODUCTS. The area of the land bearing timber of commercial value is estimated at 200,000,000 to 300,000,000 acres distributed among the provinces as follows: Quebec, 100,000,000; Ontario, 70,000,000; British Columbia, 50,000,000; Manitoba, Saskatchewan, and Alberta, 11,000,000; New Brunswick, 9,000,000; Nova Scotia, 5,000,000. During the calendar year 1918 the total value of forest products was estimated at \$190,000,000. In 1918-19 the surplus for export in the wood pulp industry was valued at \$34,706,771, mainly to the United States and Great Britain. The capital invested in the industry in that year was \$180,017,000. There were 3086 mills, employing 60,000 persons.

MINERALS. The principal mining districts are in Nova Scotia, British Columbia, Quebec, Northern and Western Ontario, Alberta, and the Yukon Territory. In 1918 the mineral production was valued at \$210,204,970, distributed as follows according to the *Statesman's Year Book* for 1920:

Product	Quantity	1918 Value ^a
METALLIC		Dols.
Copper	lbs. 118,415,829	29,163,450
Gold	ozs. 710.5-6	11,887,875

Grand total		210,204,970

^a The metals copper, lead, nickel, and silver, are, for statistical and comparative purposes, valued at the final average value of the refined metal. Pig-iron is valued at the furnace, non-metallic products at the mine or point of shipment, and structural material and clay products at the point of shipment.

The value of Canada's mineral production in 1920 is estimated at about \$200,000,000 compared with \$176,686,390 the year before. The gold output was valued at \$18,000,000. Production of other minerals follows: Silver, 13,500,000 ounces; copper, 82,500,000 pounds; nickel, 61,500,000 pounds; lead, 35,000,000 pounds; zinc, 42,000,000 pounds; pig iron, 1,000,000 short tons; steel ingots and direct steel castings, 1,220,000 short tons.

COMMERCE. The following information in regard to Canada's foreign trade was supplied by the United States Bureau of Foreign and Domestic Commerce: Canada's foreign trade in the 12 months ending Dec. 31, 1919, showed an increase over that of the previous year both in imports and exports. Total imports in 1919 were \$941,007,700, as compared with \$910,149,140 in 1918, an increase of \$30,858,560, or 3.39 per cent. The imports in 1913 amounted to only \$659,904,116, or \$281,103,584 less than in 1919, showing an increase of 42.78 per cent for the latter year, as compared with 1913. Total exports for 1919 were \$1,294,920,372, as compared with \$1,243,729,772 in 1918, an increase of \$51,190,600, or 3.91 per cent. The exports in 1913 amounted to only \$460,519,246, or \$834,401,126 less than in 1919, showing an increase of 181.07 per cent for the latter year as compared with 1913. There

was a substantial balance of trade in Canada's favor in the year 1919, exports amounting to \$353,912,672 over imports. In the year 1913 there was an unfavorable balance amounting to \$199,384,870. It is to be borne in mind that the great rise in prices during the past six years is responsible for a considerable part of the increase shown both in imports and exports of the year 1919 as compared with the figures of 1913, and the increase in quantities has not been as great as the figures of values would seem to indicate.

The following statement shows by percentages how Canada's foreign trade was distributed between the different countries:

Country	Imports			Exports		
	1913	1918	1919	1913	1918	1919
United States	64.6	81.4	78.8	37.9	36.1	36.6
Great Britain	21.2	8.0	9.3	49.8	47.4	42.5
British dominions and colonies	3.2	5.7	4.5	5.3	4.4	6.1
Other countries	11.0	4.9	7.5	7.0	12.1	14.8

The following table gives the import and export trade of Canada for the calendar years 1913, 1918, and 1919. Imports are classified as dutiable and free, and are herewith quoted from the

	1918-19	1919-20
Mdse. entered for consumption:		
Free	\$389,947,715	\$370,872,966
Dutiable	526,481,620	693,643,211
Total imports	916,429,335	1,064,516,177
Domestic mdse. exported	1,216,443,806	1,239,492,098
Foreign mdse. reexported	52,321,479	47,166,611
Grand total Canadian trade	\$2,185,194,620	\$2,351,174,886

The detailed export figures showed a great increase in the value of the agricultural food products, animals and animal products and wood and paper products sent out of the Dominion in 1919-

20, as compared with 1918-19, these groups showing respective gains of \$121,286,043, \$69,084,157, and \$59,322,165. On the dutiable goods imported in 1919-20 a total of \$187,520,613 in duties was

Classification	Imports		Exports		Reexports	
	1918-19	1919-20	1918-19	1919-20	1918-19	1919-20
Agricultural and vegetable products, mainly foods.	\$107,089,558	\$166,573,788	\$262,033,526	\$383,319,569	\$22,828,409	\$4,890,000
Agricultural and vegetable products, other than foods	51,280,524	76,856,969	26,946,216	32,804,403	2,894,675	1,531,943
Animals and animal products	42,356,616	94,920,640	244,990,826	314,074,983	9,364,079	6,565,660
Fibres, textiles, and textile products	175,025,208	224,809,166	28,641,666	34,028,314	1,834,594	3,923,765
Chemicals and chemical products	35,955,648	30,727,990	55,262,478	21,147,797	1,328,982	3,555,024
Iron and steel, and manufactures of	190,864,593	184,851,196	82,855,193	82,161,003	6,179,760	18,058,937
Ores, metals, and metal manufactures, other than iron and steel	40,014,247	53,597,285	80,655,420	56,145,291	979,742	2,597,839
Non-metallic minerals and products	132,157,850	119,620,498	25,339,368	29,222,348	8,144,217	589,921
Wood, wood products, paper, and manufactures	35,782,967	43,187,910	154,685,098	213,957,263	308,581	532,700
Miscellaneous	105,902,124	69,370,735	255,084,015	72,631,127	3,458,440	4,920,822
Total	\$916,429,335	\$1,064,516,177	\$1,216,443,806	\$1,239,492,098	\$52,321,479	\$47,166,611

official Canadian Trade and Commerce statistics with the duty collected:

Items	1913	1918	1919
IMPORTS			
Dutiable goods ..	\$438,539,132	\$511,105,417	\$607,452,288
Free goods ..	221,364,984	399,043,723	333,555,412
Total ..	659,004,116	910,149,140	941,007,700
Duty collected ..	113,881,578	154,849,472	168,920,659
EXPORTS			
Canadian ..	436,218,067	1,199,636,463	1,241,085,606
Foreign ..	24,301,179	44,093,309	55,834,766
Total ..	\$460,519,246	\$1,243,729,772	\$1,294,920,372

Figures for the fiscal year ended March 31, 1920, indicated an increase of \$165,980,266 in the grand total of Canada's foreign trade compared with the preceding twelvemonth. Imports advanced by \$148,086,842 and exports by \$23,048,292, but reexports fell off in value by \$5,154,868, as the following summary shows:

collected, or \$29,474,280 more than in the preceding year.

By general classes Canada's imports and domestic and foreign exports during the past two years aggregated:

The value of the Canadian trade by countries for the fiscal year compared with the preceding one was as follows:

The following table shows the expansion of the foreign trade since 1913-14 for trade years ending March 31:

	1913-14	1919-20
Exports (including reexports)	\$455,437,224	\$1,286,658,709
Imports	618,457,144	1,064,516,169
Total foreign trade ..	\$1,073,894,368	\$2,351,174,878
Foreign trade per capita ..	143	273

It is to be noted that in 1919-20 the total exports were not only 182 per cent greater than they were in 1913-14, but were valued at \$212,764,341 more than the total imports and exports during the latter year. Allowance should, of course, be made for the rise in prices but increase

Countries	Imports for fiscal year—		Exports for fiscal year—	
	1919	1920	1919	1920
United Kingdom	\$73,024,016	\$126,269,274	\$540,750,977	\$489,151,806
Australia	4,963,446	1,369,218	14,019,629	11,415,623

British South Africa	1,300,259	676,070	11,992,299	8,649,756
British West Indies	8,437,825	12,093,144	10,200,582	10,868,693
Hongkong	2,121,909	3,194,959	995,116	1,343,867
Newfoundland	3,098,834	2,139,614	11,325,618	16,175,443
New Zealand	7,885,436	3,415,096	7,227,509	6,987,008
Other British Empire	888,207	1,267,322	3,170,149	7,323,323
Argentine Republic	1,139,267	3,057,269	4,603,130	6,126,457
Belgium	6,270	911,407	950,318	28,463,855
Brazil	1,156,832	1,973,768	4,088,534	2,703,488
China	1,954,466	1,201,579	2,856,933	6,659,805
Cuba	3,049,953	17,585,528	5,035,975	6,329,783
France	3,641,244	10,604,357	96,103,142	61,106,938
Greece	83	700,899	16,902	29,588,984
Italy	555,112	999,040	13,181,514	16,961,312
Japan	13,618,122	13,635,680	12,245,439	7,732,514
Netherlands	495,409	2,222,434	198,985	5,653,218
United States	750,199,879	802,102,187	454,873,170	464,029,014
Other foreign countries	20,238,277	35,448,655	17,129,975	42,349,571

in the value of exports to the extent of 182 per cent far exceeds the rise in prices.

Comparing the returns by important groups the trade during the foregoing two years was made up as follows (figures are for merchandise only):

Countries	Imports from		Exports to ^a	
	1913-14	1919-20	1913-14	1919-20
United Kingdom	\$132,070,362	\$126,269,274	\$222,322,292	\$495,961,867
Other parts of British Empire	22,456,440	47,903,079	23,709,829	73,719,192
United States ^b	395,565,328	801,632,849	176,948,299	501,128,368
Other foreign countries	68,365,014	88,710,967	32,456,804	215,849,282
Total	\$618,457,144	\$1,064,516,169	\$455,437,224	\$1,286,658,700

^a Includes re-exports.

^b Exclusive of Alaska and insular possessions.

Evidence of the expanding nature of Canada's foreign trade is to be seen in the fact that trade was conducted with a larger number of countries and on a much larger scale generally than in 1913-14.

FINANCE. The estimated expenditure for the year ending March 31, 1920, was \$437,679,072, and the consolidated fund revenue was \$312,946,747. The debt on Oct. 31, 1918, was \$1,749,332,000. Down to that date the total war expenditure of the country was estimated at \$1,530,000,000.

The first budget introduced by the new finance minister, Sir Henry Drayton, provided for a series of special taxes whose return was expected to amount to about \$70,000,000. The reason given for imposing them was that the government had renounced its policy of borrowing and decided that henceforth the country must pay its way. On the other hand, certain sources of income were closed. The 7½ per cent extra customs' duty of the war on certain articles was removed; exemptions under the business profits tax were increased from 7 per cent to 10 per cent; and the duty on moving picture films was repealed. The taxes, however, more than offset this decrease. The tax most discussed because it aroused the most discontent was the so-called luxuries tax. Originally this ranged from 10 per cent to 50 per cent on certain goods specified as luxuries. The tax was imposed on the selling price whether the goods were made in Canada or not if the selling price exceeded a certain amount. Among these articles were textiles, boots and shoes, gold and silver articles, and sporting goods. Thus on boots and shoes, the tax applied to any amount over \$9 a pair. On suits

and dresses on any amount over \$45 and in each case the tax was 10 per cent. The objection to this was that it burdened the buyer of necessities and it was argued that the principle of the United States luxury tax was better, the tax of the United States being paid on the cost of goods

above a certain limit and not on the selling price. Certain modified proposals were made in the summer time with a view to meeting the objection. The tax of 1 per cent on all sales of manufacturers, importers, wholesalers, etc., was retained and continued to apply to all articles except certain specified ones, including coal. It was criticized in that it tended to be multiplied before the goods passed to the consumer. The heavy tax on liquors, the 2 cent tax on stock transfers, and the 5 per cent addition to the tax on incomes in excess of \$5000 were not changed.

RAILWAYS. The total length of railways in June, 1918, was 38,879 miles distributed as follows: Ontario, 11,057; Quebec, 4791; Manitoba, 4168; Saskatchewan, 6162; Alberta, 4273; British Columbia, 4247; New Brunswick, 1959; Nova Scotia, 1428; Prince Edward's Island, 279; and Yukon, 102. The government railways in operation, 1917-18, had a total length of 4408 miles.

Railway construction in the Dominion of Canada during 1920 aggregated 305.39 miles of new lines and 31.60 miles of second track, or a total of 336.99. This amount, it may be noted, was but very little less than the mileage of new construction in the United States although less than the 442.46 miles of 1919. This was in pursuance of the policy of expansion which the Canadian roads have been following in tapping and building up new sections of the country. Canada, as regards settlement and resources, was in many ways undeveloped, so that from 1906 to 1913 there was active railway construction throughout the Dominion. In 1914 with the war this began to decline reaching a minimum in 1918. The figures for 1919 and 1920 however were considered as indicating a resumption of

railway building for Canada. Much of the new construction was in the form of branches connecting with the trunk lines.

Late in the year the government of the Province of Manitoba granted authority to the Canadian National Railways to undertake immediately a survey for a new line from The Pas to the Flin Flon mining area, about 90 miles northward. A new railroad for Quebec also was announced late in the year, to be 120 miles long, from Chicoutimi to St. Felicien, via the north side of Lake St. John. A contract was signed between the government of the Province of Quebec and the Quebec & Chibougamou Railway Co. providing for the new line which will run through timbered country. A large amount of the material had been contracted for and the road was to be completed in two years.

DEFENSE. Before the war the permanent force was 3500 and the active militia 68,000. During the war Canada provided 628,964 men, of whom 465,984 enlisted voluntarily, the remainder being added under the Military Service act, which went into effect in the winter of 1916-17. The Canadian army during the war consisted of four divisions and a cavalry brigade in France, in addition to garrisons in the Dominion and the West Indies and the detachments sent to North Russia and Serbia. The casualties in the Canadian force during the war were placed at 213,208 of whom 55,205 were killed or died of wounds or disease. Demobilization began in December, 1918, and was nearly completed at the beginning of 1920. In the latter year measures were taken toward the restoration of the same system as had existed before the war. See NAVAL PROGRESS.

GOVERNMENT. The executive power is normally vested in the King, but is exercised in his name by the Governor-General who acts through a responsible ministry. The legislative power is vested in a Parliament of two houses, the Senate and the House of Commons. The senators are nominated for life and the members of the House of Commons are elected by direct suffrage for five years. The Senate has 96 members and the House of Commons had at the beginning of 1920, 234 members as follows: 82 for Ontario, 65 for Quebec, 16 for Nova Scotia, 11 for New Brunswick, 15 for Manitoba, 13 for British Columbia, 3 for Prince Edward Island, 16 for Saskatchewan, 12 for Alberta, and 1 for the Yukon Territory. As the result of the election of December, 1917, the Unionists in the House of Commons numbered 151 and the opposition 81. Governor-General in 1920, the Duke of Devonshire.

The ministry after the fall of the Borden cabinet (see below) was constituted as follows: Secretary of State for External Affairs (First Minister), Right Hon. Arthur Meighen; Minister of Trade and Commerce, Right Hon. Sir George E. Foster; Minister of Finance, Hon. Sir Henry L. Drayton; Minister of Justice, Right Hon. C. J. Doherty; Minister of Labor, Hon. Gideon Robertson; Minister of Railways and Canals, Hon. J. D. Reid; Minister of Soldiers' Civil Re-establishment, Hon. Sir James A. Lougheed; Secretary of State of Canada (acting), Right Hon. Arthur L. Sifton; Postmaster-General, Hon. P. E. Blondin; Minister of the Interior and Minister of Mines, Hon. Sir James A. Lougheed; Minister of Marine and Fisheries and Minister of the Naval Service, Hon. C. C. Ballantyne; Minister of Customs and Inland Revenue,

Hon. R. W. Wiggmore; Minister of Immigration, Colonization, and Health, and President of the Privy Council, Hon. J. A. Calder; Minister of Militia and Defense, Hon. Hugh Guthrie; Minister of Agriculture, Hon. Simon F. Tolmie; Minister of Public Works, Hon. F. B. McCurdy; Member of Privy Council without portfolio, Edgar K. Spinney.

HISTORY

PARLIAMENT. The parliamentary session opened February 26th. Among the important questions before it was that of the future naval policy. A report on that subject had been made by Admiral Jellicoe which included a plan providing for complete local control while making the Canadian navy an integral part of the imperial naval force. English officers were to hold the high commands in it until the Canadians had received the requisite training. It was decided after some vigorous discussion that at present owing to the financial burdens and to uncertainty as to imperial naval policy, Canada would not embark upon an expensive naval programme. It was agreed to maintain at Canadian expense however, a cruiser, two destroyers, and two submarines, which were supplied by the British government (June 15th). Meanwhile, the strength of the government was indicated by the result of a contest on March 10 in which the opposition tried to drive the ministry from power by the proposal of an amendment to the speech from the throne. Parliament expressed confidence in the ministry by a majority of only 34.

MINISTERIAL CRISIS. Sir Robert Borden resigned as Prime Minister at the beginning of July and was succeeded by Mr. Arthur Meighen. By-elections were held for the Federal Parliament on September 20th in St. John, New Brunswick, and resulted in a large majority for the ministerial candidates. The provincial elections were held in New Brunswick on October 9th and according to the preliminary returns the Liberal government lost three of its representatives. Two members of the cabinet were defeated, though the Prime Minister, Mr. Foster, was returned. In New Brunswick and two other provinces, namely Ontario and Manitoba, the group system prevails, that is to say, the largest party in each house of the provincial parliament has not a majority over the other groups. Many believed that the Federal Parliament itself would before long be divided into groups in the same manner.

ELECTIONS. A by-election in Ontario in December resulted in the defeat of the government candidates. Another in British Columbia resulted favorably for the government. General elections in British Columbia, December 1, indicated the desire for a change of ministry, for although the Liberals (government) were not decisively defeated, the opposition to them was strengthened.

PROHIBITION. A referendum in British Columbia on October 26th resulted in a vote in favor of a system of public liquor dispensaries under government control, a majority of over 30,000 being against the continuation of the existing system, which allowed importation for private use. In Alberta, Manitoba, Nova Scotia, and Saskatchewan, which had already adopted provincial prohibition, a referendum was taken on the question of prohibiting the importation of liquor on October 25th, and all four provinces voted for the prohibition. This would make all these provinces

completely "dry" as soon as the Federal Order in Council should go into effect.

PROPOSED AMENDMENT TO THE CONSTITUTION. In the latter part of the year there was an increasing demand for the right of Canada to amend her own constitution without applying to the King and his advisers. In this Quebec did not participate because her language and civil law rights would be guaranteed against aggression so long as the consent of the British Parliament was required for amendments. Outside Quebec, however, the movement was popular and Parliament passed a resolution calling upon the imperial Parliament to amend the confederation act known as the British North American Act, in such a way as to place Canadian legislation on an extra-territorial basis. It was argued that it was absurd for a nation that had an independent status to be compelled to ask the Parliament of another country for permission to amend its constitution. Connected with this movement was the demand that Canada should have a minister with full powers representing her in the United States. Objection was raised on the ground of possible difficulty from confusion of his functions with those of the British Ambassador. The Liberal opposition attacked the measure from this point of view. The government argued that inasmuch as three-fourths of the work done by the British Embassy at Washington related to Canada and as thus far it had not engaged persons especially familiar with Canadian affairs, the time had come when Canada should have its own direct representative.

IMMIGRATION. Further measures were taken in December toward restricting immigration of the working classes from other countries and an order was adopted December 1st, providing that no immigrant should enter unless he possessed \$250 in his own right, the amount previously required being \$50; and if accompanied by his family those over 18 years of age must have the equivalent of \$125 apiece, and each member between the age of five and 15 must have \$50. The order went into effect December 15th on the American boundary and was to go into effect January 1st at the ocean ports.

CANADA AND THE LEAGUE. The belief in the United States that Canada as a member of the League would always vote with Great Britain was not shared by the general opinion in Canada itself. It was pointed out that the representatives of Canada in the Assembly of the League would be expected to express opinion in Canada, rather than in the British Empire. During the meetings of the Geneva Assembly, moreover, the Canadian representation showed an independent attitude and ranged itself generally with the more liberal element. In fact the Canadian delegate, Mr. Doherty, drew general attention by his criticism of the European diplomacy that had preceded the war and he emphasized the necessity of a new spirit in international affairs. He gave it to be understood that the new world representatives did not intend to let themselves be dragged at the heels of European diplomats whose policy in the past had brought on the war.

OTHER EVENTS. On May 10th it was officially announced that in the future Canada would be represented at Washington by her own resident minister. On June 9th representatives of Canada and of the West Indies in conference at Ottawa agreed upon a system of reciprocity in customs duties and upon a plan for the improvement

of shipping facilities between the two parties. A tariff commission under the Ministry of Finance toward the close of the year was taking evidence throughout the country. The main argument that the protectionists were using was based on trade figures, showing that the imports from the United States amounted to \$900,000,000 as against \$500,000,000 in exports during the year. The Prime Minister, Mr. Arthur Meighen, on October 26th declared that the tariff issue would be put before the electors in plain terms in order that they might decide between the government and its opponents. The discovery of rich oil lands near Fort Norman on the border of the Arctic Circle and over 1000 miles due north of Edmonton was announced toward the close of the year. A crime that drew much attention during the closing weeks of the year was the killing of the proprietor of a hotel at Sandwich, Ontario, by a Methodist minister who had been licensed as an inspector after criticizing the failure of the government to enforce prohibition. The coroner decided that it was done in self-defense. The affair aroused much discussion over the question of enforcement. See **ANTHROPOLOGY; EXPLORATION.**

CANALS. The discussion of new projects rather than actual construction prevailed in 1920. The Great Lakes Waterway was vigorously argued, work was done on the Welland Canal of Canada, and other enterprises in connection with schemes of internal waterways were put forward especially in view of the increased freight rates on the railways.

ST. LAWRENCE WATERWAY. During 1920 the engineering investigation of the proposed Great Lakes to the sea deep waterway provided for in the United States River and Harbor Act was under way. This project required considerable construction as a 35-foot waterway was contemplated and the joint commission headed by Col. W. P. Wooton, Corps of Engineers, United States army, for the United States, and W. P. Bowden, Chief Engineer of the Department of Railways and Canals, for Canada, was engaged in an engineering inquiry as to the possibilities and difficulties and cost of such a waterway. This plan was to be completed in the spring of 1921. In the mean time the plan was vigorously advocated by commercial and other agencies interested and also opposed in other quarters. A notable address on the engineering requirements of the proposed waterway was delivered before the Western Society of Engineers by Maj. John C. Lee, Corps of Engineers, United States army.

ILLINOIS STATE WATERWAY. After the passage of the Illinois Deep Waterway Act of 1919 providing for the construction of a canal for barge navigation between the Chicago Drainage Canal at Lockport and the Illinois River at Utica (see **YEAR BOOK** for 1919), the State of Illinois submitted plans prepared by its new Division of Waterways to the Federal government. These were approved by the Secretary of War and the Chief of Engineers, United States army, and application was also made for permission to develop water power under the terms of the Water Power Act. Proposals were invited for the construction of various parts of the project and in October, 1920, the first contract for the lock at Marseilles, Ill., was awarded for \$1,373,115, exclusive of gates, valves, and operating machinery. The distance to be traversed by the new waterway is about 60 miles with a difference

in water elevation of about 123 feet for which five locks of from 41 to 16 feet lift are required. The canal will have 8 feet of water in earth and 10 feet in rock sections, and the locks were designed to be 110 x 600 feet with 14 feet of water on the sills at low water so as to provide for a future deepening of the waterway to 14 feet. Barge fleets with 7500 tons of cargo are to be accommodated as this practice had been found most useful on the Ohio River. The new project would make possible the removal of the existing dams and locks in the lower part of the Illinois River, affording a 9-foot open channel from La Salle to the Mississippi River in addition to the new development. For the five locks there were to be required three new dams, and below an existing dam forming a diversion channel one of the locks was to be placed. All of the locks except that at Lockport where the Sanitary District of Chicago had a hydro-electric plant, were to have power houses. The dams were to be of the gravity type built of concrete with movable crests formed by Taintor gates to afford ample flow for flood waters. The traffic capacity of the new waterway was estimated at 60,000,000 tons annually and its completion was anticipated by 1924. The estimated cost was placed at \$20,000,000 with \$8,000,000 additional for water. See paper read before Western Society of Engineers and *Engineering News-Record*, page 1095, Dec. 2, 1920, vol. LXXXV, no. 23.

NEW YORK BARGE CANAL. This great undertaking which was 15 years in construction and required with its various adjuncts and appurtenances over \$180,000,000 in 1920 again failed to realize expectations or to accommodate an amount of traffic commensurate with the outlay. Construction progress continued on the various terminal facilities including a huge grain elevator in Gowanus Bay, New York harbor. While the Barge Canal since its construction had become adequate to handle a large amount of commerce and thus aid or possibly compete with the railways, yet completed as it was about the time of the world war its facilities never had been utilized to any considerable extent. It was commandeered by the government and a small fleet of modern boats was built and operated by the Emergency Fleet Corporation but they were not adequate in number and only served to discourage private construction and operation. In 1919 the total traffic on the New York Barge Canal System was only 1,238,844 tons which was 5,000,000 tons less than the amount carried by the old Erie Canal in any year between 1868 and 1884 and less than one-third the traffic from the latter date to the beginning of reconstruction in 1903. In 1920 it was estimated that between 20,000,000 and 25,000,000 tons per season could be handled and with the ceasing of government control private transportation and manufacturing interests located on the banks began actively to consider a fuller utilization of its facilities. One company in particular was organized during the year to start in the season of 1921 with some 25 oil-burning steamers and 75 750-ton steel barges thus added more than 1,000,000 tons annually to the carrying capacity of the canal.

CANALS AT SAULT STE. MARIE. The United States Canal at Sault Ste. Marie, Mich., was opened April 19th and closed Dec. 26, 1920; thus making its season 252 days. The Canadian Canal was opened April 23 and closed Dec. 23, 1920; with a season of 244 days.

There was an increased commerce through the canals in 1920 over the previous year and the comparative statement of lake commerce through both canals at Sault Ste. Marie, Mich., and Ontario for the seasons of 1919 and 1920 is shown below:

Items	Total Season 1919	Total Traffic for Season 1920	P. ct.
Vessels:

* Short tons.

See PANAMA CANAL.

CANARY ISLANDS. A group of islands belonging to Spain, situated off the northwest coast of Africa. Area, 2808 square miles. The population was estimated Dec. 31, 1918, at 513,959; census of Dec. 31, 1910, 444,016. The capital, Santa Cruz de Tenerife, had a population in 1910 of 63,004; estimated Dec. 31, 1918, 72,871. Another large city is Las Palmas with a population estimated, Dec. 31, 1918, at 69,270. The leading exports are tomatoes, potatoes, bananas, and wheat.

CANCER. Cancer is being cured to-day in large numbers, although in a very small percentage of cancer victims (for the diffusion of the disease is enormous), by the knife, by radium, by the x-rays, by electrical cautery, and even by chemical caustics. These remedies are in a sense competitive although each has a definite field of application. The idea of combining or alternating them is of course by no means new but the more recent literature shows that the combined methods are beginning to be systematically applied, so that we shall know before long whether such combination means an advance in cancer treatment. The scarcity of radium with the fact that its ownership is concentrated in the hands of the few makes the problem of combined treatment difficult at the start. It is rare to find a medical man who is equally versed in the technics of application of all of these remedies, and it is in fact a foregone conclusion that the combined methods make advisable the coöperation of a number of specialists. The most eminent technicians are so wedded to their specialties that they are apt to underrate the work of their colleagues. The most accomplished x-ray specialists claim that they can equal any results produced by radium, while some of the radium experts claim that they have supplanted the use of the knife in cancer at least in certain localities such as the uterus. To illustrate the simultaneous application of several resources let us take the case of a malignant growth involving both the

CANAL BOATS AT PITTSFORD DOCK

VIEWS OF NEW YORK STATE BARGE CANAL

△

soft and bony structures of the face, of the type deemed inoperable at the start. The growth consists largely of tissues already degenerated. To excise these with the knife exposes the patient to a number of risks, not the least of which is the danger of spreading the disease through the severed blood-vessels. Hence some form of electrical head is applied in such intensity that the degenerated tissues are "cooked" to use a familiar expression. Within a short time the "cooked" tissues separate and leave a healing cavity. Early in the treatment and perhaps before the application of heat, the x-ray has been used intensively over the tumor and its contiguous tissues with especial reference to the absorbent vessels, which bear the cancer cells to the nearest glands or lymph nodes. It has been proved that the rays are able to contract the channels of the absorbents in such a manner as to make this transportation difficult or impossible. But some of the bony tissue, as the upper or lower jaw, has become involved in the disease and can be removed only by cutting instruments. This is done at the most opportune time and as soon as possible. Thus far the periphery or growing part of the tumors which surrounds the degenerated area has not been attacked and now radium is in demand. Tubes of the latter are inserted in these regions in such a manner as to expose all of the growing tumor tissue to the penetration of the rays. Within a short time the several wounds have healed with a smooth scar and if the technic has been perfect there is little chance that the growth will reappear in the original area. In case it should start up anew at some point radium or one of the other local methods of treatment is called upon. The patient is kept for a long time under the influence of the x-rays to prevent glandular recurrence and if such recurrence appear it may be treated by single or combined methods. Appearance of the disease at a distance through transportation by the blood circulation is usually beyond the possibility of cure and we have but one resource here—the x-rays. In some of these secondary growths which are most accessible to the rays some remarkable results have been obtained. The disease has been arrested and the patient seemingly cured. Such results have been obtained for example in secondary growths of the spine. In inoperable cancer of the breast the use of chemical caustics have recently been revived for the destruction of the degenerated cancer tissue. The patient is anesthetized and by means of caustic potash the tissue is rapidly destroyed in much the same fashion as when electric heat is used. The large cavity which may form heals slowly with a good scar, although skin grafting is sometimes necessary.

The intense activity of research in the province of malignant disease can hardly help but bear fruit, but owing to the real or apparent continuous increase in the diffusion of the disease, the benefits have not yet been realized by a reduction of the mortality. Rapid increase of cancer in Brazil has led to agitation intended to make the disease reportable and to isolate the victims as in the case of leprosy. Cancer is not known to be contagious and in the case of leprosy contagion has always been difficult to prove; but since segregation has caused an arrest in the spread of leprosy it is thought wise to test the measure on the other disease. As far as can be learned no actual steps in this direction have

yet been taken. The idea would be quite impracticable in any one of the old civilized countries where cancer has abounded for years but in a country like Brazil with a large aboriginal and primitive population hitherto relatively immune to the disease (it exists in the cities and amid the white civilized communities there as elsewhere in the world) the general diffusion of the malady suggests some drastic measure and from analogy of other racial plagues, segregation seems worth trying.

We are learning more and more that whatever else cancer may be it tends to result from persistent irritation of any kind. It has not always been easy to connect definite irritants with the disease, but of recent years it has become possible to associate cancer within the mouth and throat with multiple irritation. Thus in London a surprising number of victims present the effects of several of the following types of irritation: tobacco addiction—the excessive smoking of cigars and pipes; the use of very hot foods and the tendency to increase the temperature more and more as one becomes tolerant; the drinking of very hot tea and coffee; alcoholic abuse; the excessive use of table salt which acts unfavorably on the mucous secretion; the history and often actual lesions or scars of the disease syphilis, which is present in from 20 to 100 per cent of material treated by individual throat specialists and the presence of infected mouth and pyorrhœa. In not every region of the body is there such cumulative evidence of irritation. But another great truth concerning the immediate cause of cancer is seen in the demonstration of a preceding chronic inflammation, which implies the existence of some irritant as yet not recognizable. Thus in cancer of the breast pathologists now claim to find evidence in practically all cases of this pre-existence of inflammation, although in many cases we cannot predicate the cause. In many women the inflammation is the sequel of lactation, but there is nothing to account for this pre-cancerous condition in women who have never borne children.

The rapid increase of cancer of the stomach is in part due to the same factors which cause the disease in the throat, such as swallowing very hot food and drink, but this is only a fraction of the causation. The immunity of the Indian from cancer of the stomach is connected with the fact that the same Indian has none of the local affections of the stomach summed up under dyspepsia. In other words frequency of cancer of the stomach is due largely to the very great frequency of gastric disorders as a whole. Whatever provokes the latter will be a factor in cancer. Simple ulcer of the stomach has long been known as a fertile cause of the latter. Half chewed bits of food which reach the stomach are repeatedly projected against the pyloric ring which is the chief seat of the disease in that organ.

Under the head of treatment it is admitted that radium and the x-rays in the hands of certain experts are doing much good—so much in fact that certain governments have been buying up radium in order that the poor may receive the same advantage as the wealthy. A tendency to combine the best features of surgery, caustics, and radiation in the individual patient is at present developing.

CANDIA. See CBETE.

CAPE COLONY. See CAPE OF GOOD HOPE PROVINCE.

CAPE OF GOOD HOPE PROVINCE. One of the four constituent provinces of South Africa, formerly known as Cape Colony and now constituting the southernmost province of the Union of South Africa; area, 276,966 square miles, with a total population of (census of 1911) 2,564,965; European or white, 582,377; colored, 1,982,588. In 1918 the European population numbered 619,319. The colony is divided as follows: Cape Colony Proper, East Griqualand, Tembuland, Pondoland, Transkei, Walfish Bay, and Bechuanaland. The capital is Cape Town, with a white population in 1918 of 99,693. Other towns with populations at that date are: Kimberley, 17,188; Port Elizabeth, 23,339; East London, 17,592. The races are mainly Hottentots, Malays, Kaffirs, Fingoes, and Bechunas. The census of 1911 gave the colored population of mixed race at 415,282. The Malays at that time numbered 19,763. On June 30, 1918, there were 4888 schools aided by the state with an enrollment of 269,422 (provisional figures, 1919). The trade between the Cape of Good Hope and the United Kingdom was: Exports to the United Kingdom, £15,104,000; imports from the United Kingdom, £9,097,000, of which £8,795,000 consisted of British produce and manufactures. The colony was merged in the Union of South Africa, May 31, 1910. The executive power is vested in the governor and in an executive council which consists of office holders appointed by the crown. See SOUTH AFRICA, UNION OF.

CAPE VERDE ISLANDS. A group of islands, 14 in number, belonging to Portugal and situated off the west African coast, with a total area of 1516 square miles, or according to some authorities, 1480 square miles, and a population at the census of 1912 of 149,793, of whom 4799 were white. The chief products are medicinal plants, coffee, hides, and millet. The estimated revenue and expenditures in 1917-18 balanced at 776,799 escudos. For further statistics see the preceding YEAR BOOKS. Capital, Praia.

CARILLON MAGICO, IL. See MUSIC, Opera.

CARINTHIA. Formerly a crownland of Austria in the Austro-Hungarian Empire; after the disruption of the Empire, a province of the new Republic of Austria itself; bounded by Tirol on the west, Styria on the east, Salzburg and Styria on the north, and Venetia, Görz and Carniola on the south; area 3987 square miles; population at the census of 1910, 396,200; estimated in 1913, 406,162. In 1910 the German-speaking element numbered 304,287. The majority are of the Roman Catholic religion. The capital is Klagenfurt with a population of 28,911 in 1910. Carniola was formerly represented by 10 members in the lower house in the Austrian Parliament and was locally governed by a single chamber of 43 members.

CARLISLE, BISHOP OF. See DIGGLE, J. W.

CARLISLE INDIAN SCHOOL. See INDIAN TRAINING AND INDUSTRIAL SCHOOL.

CARNEGIE ENDOWMENT FOR INTERNATIONAL PEACE. See INTERNATIONAL PEACE AND ARBITRATION.

CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING. See UNIVERSITIES AND COLLEGES.

CARNEGIE INSTITUTE OF TECHNOLOGY. A non-sectarian institution of the higher learning at Shennley Park, Pittsburgh, Pa., founded in 1900. In the summer session of 1920 there

were 511 students enrolled and in the regular fall session, 4123. The faculty numbered 396, including 71 additions. The income for the year was \$1,603,880. There were 10,307 volumes in the library on the campus, a branch of the adjacent Carnegie Library, which contains 450,000 volumes and is used by the students. President, Arthur Arton Hamerschlag.

CARNEGIE INSTITUTION OF WASHINGTON. The year was spent for the most part in returning to normal activities for the various departments. Most of the investigators who were drawn off during the war into government service or into the activities of industrial life had returned to their posts, in some cases to accept salaries much less than those offered by industrial concerns. Extraordinary results had already been obtained with the possibilities for the future by the Hooker telescope which was given a thorough test of its capabilities at the Mount Wilson Observatory during the year. The sixth cruise of the non-magnetic yacht *Carnegie* in October, 1919, to October, 1920, was the most successful one both with regard to rate of progress and in work accomplished. This vessel since it was put into commission in 1909 had traversed 250,000 miles. The trustees of the Institution decided to establish a Department of Genetics at Spring Harbor with sections of experimental evolution of eugenics, Record Office, the latter having been donated to the Institution by E. H. Harriman in 1918. Volume II of Professor Dickson's *History of the Theory of Numbers* appeared during the year. It is devoted to "Diophantine Analysis."

A notable event in the history of the Institution was the retirement of President Woodward on Dec. 31, 1920, who has guided the work for so many years. Dr. John C. Merriam of the University of California was appointed to take his place on Jan. 1, 1921.

Total receipts for the fiscal year 1919-20 were \$1,553,930.64, making a total received since its founding in 1902 of \$18,972,089.26. The publication of eight volumes was authorized by the Executive Committee during the year. Twenty-two volumes were published during the year, and 16 additional volumes were in press at its close.

CAROLINE ISLANDS. See GERMAN NEW GUINEA.

CASE, CLIFFORD PHILIP. Clergyman, died March 7th. He was born at Jersey City, N. J., Oct. 22, 1873; graduated at Rutgers College, 1897; after graduating at the New Brunswick Theological Seminary in 1900, was ordained to the Dutch Reformed Church. He was pastor in New Jersey and then for several years at Poughkeepsie, N. Y. After 1915 he was permanent clerk of the General Synod of the Reformed Church of America.

CASE SCHOOL OF APPLIED SCIENCE. A college of engineering at Cleveland, Ohio, founded in 1881, which gave courses in civil engineering, mechanical engineering, electrical, mining, and chemical engineering, and physics. In the fall of 1920 there were 743 students and 67 members of the faculty. The endowment amounted to \$2,580,000 and the income from all sources for the year 1919-20 was \$276,000. The department libraries contained 15,200 volumes. The chief addition to the equipment was the Warner and Swasey Observatory, which was dedicated October 12th. It is furnished with a 10-inch telescope, two astronomical transits, a zenith

telescope, and two Riefler clocks. President, Charles Sumner Howe, Ph.D., D.Sc.

CASSIDY, JOSEPH. Politician, died in Brooklyn, N. Y., November 21. For many years he was boss of the borough of Queens and at one time its president. He was born in the borough of Queens in 1866; was educated in the common schools and went to work in a large department store, in which he became the head of the fur department. He went into politics while still a young man and was appointed excise commissioner of Long Island City, which office he held until 1893. He became popular in local politics at the time of the consolidation of Brooklyn with greater New York and rose to the position of leader of the Democratic organization in Queens. His political power thereafter was virtually absolute, and he was especially popular among the younger element by whom he was known as "Curly Joe." He supported the successful candidate for the office of first Borough President of Queens under the new Greater City administration in 1897 and he was himself chosen his successor, and secured a second term. There was an extensive real estate development and he was believed to have amassed a large fortune during his term. Charges were made against him by the taxpayers, but no action was taken. He was defeated in subsequent campaigns for the office, but he retained control of the Democratic organization for many years. He still was partly in control in 1912, when he was indicted on the charge of selling the Democratic nomination for Supreme Court Justice. He was convicted Feb. 3, 1914, and sentenced to Sing Sing, but was released on parole on Jan. 26, 1916, and his citizenship was restored a year later.

CASTLE, EDGERTON. British popular novelist, died in the middle of September. He was born March 12, 1858, studied at the universities of Paris and Glasgow and graduated at Trinity College, Cambridge, with honors. He also passed through the Sandhurst Military Academy and the Inner Temple. After this wide range of studies he went into journalism serving for a number of years on the staff of the *Saturday Review*. Meanwhile he had published a treatise on *Schools and Masters of Fence* (1884). The list of his stories of which the greater number were written in collaboration with his wife, Agnes Castle, is too long to be reproduced here. Many of them were of an extraordinary popularity and some of them on being dramatized met with equal success on the stage. The best known of the earlier ones were *The Pride of Jennico* (1898) and *The Bath Comedy* (1899), both of which were dramatized with great success, the latter under the name of *Sweet Kittie Bellairs*. Among others were *The Secret Orchard* (1900); *Incomparable Bellairs* (1904); *My Merry Rockhurst* (1907); *The Hope of the House* (1915); *The Black Office* (1917); *Wolf Lure* (1917). The field of his writings was that of conventional romance. He was as successful in swordsmanship as in the writing of novels. For many years he was amateur champion of Great Britain in swordsmanship, and he was captain of the British épée and sabre teams at the Olympic games in 1908.

The latest romance was *John Seneschal's Margaret*; it also was written in collaboration with Agnes Castle.

CATALAN. See PHILOLOGY, MODERN.

CATHOLIC UNIVERSITY OF AMERICA.

A Catholic institution of the higher education situated at Washington, D. C., founded in 1887. The total number of students for the year 1920-21 was 1826 and the members of the teaching staff numbered 82. The university includes schools of sacred science, law, philosophy, letters, and sciences, and also a summer school. With the authorization of the university, colleges and seminaries may be affiliated, the affiliating institutions maintaining their self-government. In 1920 the affiliating institutions were the St. Paul Seminary at St. Paul, Minn., and the following institutions situated near the university: College of St. Paul the Apostle; Holy Cross College; Franciscan College; Apostolic Mission House; Trinity College; College of the Immaculate Conception; Catholic Sisters' College, and Mount St. Augustine's College; also the Institute of Scientific Study in New York City, and Mount St. Mary's Seminary of the West at Cincinnati, Ohio. Rector, the Rt. Rev. Thomas Joseph Shahan, S.T.D. LL.D.

CATTLE. See LIVESTOCK; DAIRYING; VETERINARY MEDICINE, etc.

CAUCASUS. The region of southeastern Europe comprising the isthmus which separates the Black Sea and the Sea of Azov from the Caspian Sea. It was formerly one of the general governments of the Russian Empire, divided into the two districts Ciscaucasia and Transcaucasia, with an area of 181,173 square miles and an estimated population, Jan. 1, 1915, of 13,299,100. No later statistics were available than those given in preceding YEAR BOOKS. Transcaucasia since the beginning of 1919 has been politically divided into the three small republics of ARMENIA, AZERBAIJAN, and GEORGIA (q.v.).

CELEBRATIONS. The greatest celebration of the year was the Pilgrim Tercentenary Celebration (q.v.), commemorating the 300th anniversary of the Landing of the Pilgrims at Plymouth in 1620. Two States, Alabama and Maine, celebrated the centennial anniversary of their admission to the Union and in honor of these events special commemorative coins of the value of 50 cents each were authorized by Congress to be made at the United States mint.

The celebration of the 400th anniversary of the discovery of the Straits of Magellan was held in Chile during November and December. The festivities were held principally in Santiago and Punta Arenas, the latter the world's southernmost city, where the occasion was marked by the inauguration of important public works, including port improvement, lighthouses in Smith Channel, a highway between Punta Arenas and Natales, on the South Atlantic Coast, and laying of a corner stone of the Punta Arenas University. The Hon. Joseph H. Shea, who represents the United States in Chile, was appointed a special ambassador to represent this country at that event. Besides the United States, Great Britain, Spain, and Portugal were invited to send special representatives to the celebration.

Brazil proposes to celebrate the centenary of its independence in September, 1922. That country separated from the Kingdom of Portugal and was proclaimed independent by Don Pedro I, the first Emperor of Brazil, on Sept. 22, 1822.

Plans entailing an expenditure of \$12,500,000 have been prepared. They include an exposition of fine arts, erection of a national historical museum and composition of an historical opera, and a drama. The scheme also provides for the or-

ganization of a great university. Sports will be a feature of the celebration. It has also been suggested that a national pantheon for all the illustrious personages of Brazil should be erected in Rio de Janeiro in connection with the celebration. It is proposed to erect in Sao Paulo one of the finest commemorative monuments in the new world as it was there that the first proclamation of independence was made.

CELTIC. See PHILOLOGY, MODERN.

CENSUS. During the fiscal year ending June 30th the Bureau of the Census completed its preparations and made the decennial enumeration of the population, agriculture, manufactures, mines, quarries, oil and gas wells, irrigation and drainage enterprises, and forestry products of the United States. The enumeration of the population and agriculture, which began on Jan. 2, 1920, was brought to practical completion some time before the close of the fiscal year, and all returns which were then outstanding have since been received. The preliminary announcement of the population of the United States (q.v.) made on Oct. 7, 1920, showed a total of 105,683,108, representing an increase of 14.9 per cent during the past decade, as against an increase of 21 per cent during the preceding 10 years. This falling off in the rate of increase was due mainly to the almost complete cessation of immigration at the time of the outbreak of the European war.

The census inquiries pertaining to manufactures, mines and quarries, etc., were made entirely independently of the censuses of population and agriculture; and the field work on these inquiries necessarily consumed a greater length of time. The work in the most important industrial districts was done either by special agents temporarily employed for the purpose or by permanent employees of the Bureau. The canvass was begun in February and was brought to practical completion in October.

The office force in Washington at the beginning of the census period, July 1, 1919, numbered 609, and by the close of the fiscal year, June 30, 1920, it had been expanded to 5502, exclusive of the 329 special agents paid on a per diem basis and 324 employees on the four-hour night force. The "turnover" in the force was enormous and exceedingly expensive. The cost of the field work for the enumeration of population and agriculture was approximately \$9,345,000, which represents a material increase as compared with the cost in 1910. Nevertheless, the increase is not as great as the average increase in wages in various industries or in the cost of necessities of life between 1910 and 1920. That is to say, the total cost of the enumeration in 1920 would purchase a smaller amount of the necessities of life than could have been purchased by a sum equal to the total cost of the enumeration in 1910. The per capita cost of the enumeration represented a still greater reduction when measured in commodity units. The cost of the 14th census work during the first fiscal year in which the bulk of the field work was done, was approximately \$14,000,000 and the Director estimates that the total cost of the work during the three-year period will be \$23,765,000, of which amount \$22,550,000 has been appropriated, leaving a balance of \$1,215,000 unappropriated.

WORK NOT CONNECTED WITH DECENNIAL CENSUS. During the census period the Bureau's force was, of course, employed mainly on the decennial census work, and its other lines of work

were relegated to the background. The important inquiries made at annual or more frequent intervals were, however, continued. These include statistics of births and deaths; financial statistics of cities and States; statistics on the production and distribution of cotton, cottonseed, and cottonseed products, and statistics of stocks of leaf tobacco held by manufacturers and dealers. The work on these and certain other inquiries was carried on with little interruption, except that the city and State finance investigation was curtailed. See AGRICULTURE and UNITED STATES.

CENSUS, AGRICULTURAL. See AGRICULTURE.

CENTRAL AMERICA. The territory in the south of the North American continent including Guatemala, Honduras, Costa Rica, British Honduras, Nicaragua, and Salvador. The term also sometimes includes Panama. See these titles. The project conceived in recent years for the confederation of the five Central American divisions made some progress in the course of the year. Delegates from Guatemala, San Salvador, Honduras, Nicaragua, and Costa Rica held a meeting early in December and elected officers who were to begin at an early date the work of organization. Conference was previously held by the presidents of Nicaragua and San Salvador, the Foreign Minister of Guatemala, and a representative of Costa Rica at Amapala in Honduras (November 19th). Representatives of Spain and the United States were present. At the close of the year a draft of an agreement on the subject was under consideration.

CEYLON. An island in the Indian Ocean off the southern end of Hindustan, constituting a British colony. Area, 25,481 square miles. Population in 1911, 4,110,367, estimated at the beginning of 1919, exclusive of the military and shipping, 4,686,383. The Maldive Islands situated 400 miles to the west and governed by a local sultan, pay an annual tribute to the Ceylon government. They are inhabited by 70,000 Mohammedans. The population of Ceylon is distributed by race according to 1918 estimate as follows: Singhalese, 2,089,364; Tamali, 1,352,492; non-Malay Mohammedans, 277,630; Burghers, 29,043; Malays, 14,118; Europeans, 7301; Veddahs and others, 16,435. The marriage rate according to 1918 estimates was 10.2 per 1000, the birth rate 39.2, and the death rate 31.9. Distribution according to religion in 1918: Buddhists, 2,823,652; Hindus, 1,070,791; Mohammedans, 323,694; Christians, 466,964. The urban population is about 13 per cent of the total. The chief towns with their 1911 populations are Colombo, 211,274; Galle, 39,960; Jaffna, 40,441; Kandy, 29,451. The government schools in 1918 numbered 843 with an attendance of 88,588 boys and 30,691 girls; aided schools, 1850, with an attendance of 134,055 boys and 81,406 girls; unaided schools, 1128, with an attendance of 27,003. In English and English vernacular schools which numbered 329, there were 38,528 boys and 10,612 girls. The acreage under coconuts in 1918 was 925,921; rice, 678,814; other grains, 146,572; tea, 505,689; rubber, 281,491; cinnamon, 37,969; cacao, 30,851. The chief mineral for export is plumbago, of which the mines, Jan. 1, 1919, numbered 263, and the exports for 1918 were 304,340 hundredweight. Other minerals include gold, thorium, and monazite, and there are many quarries of small gems. The manufactures chiefly consist in the working of agricultural

products, as, for example, the making of coconut oil. The registered factories in 1918 numbered 1040. The imports in 1918 inclusive of bullion and specie were £11,840,112; the exports £14,208,922. In 1919 the imports amounted to \$95,729,492; exports, \$141,507,170; re-exports, \$5,314,742. A little over 30 per cent of the imports came from British India, which received nearly 7 per cent of the exports. The United States received 33¼ per cent of the exports and the United Kingdom 42 per cent. The import trade with the United States is relatively small. Of the total exports in 1919, the most important was rubber, amounting to \$55,492,495; next, tea, \$46,600,656; and then in the order of their importance, copra, cocoanuts, cinnamon, cacao, areca-nuts, and coir. Revenue (1917-18), £4,262,242; expenditures, £4,329,036. The public debt on Sept. 30, 1918, was £5,251,513. The shipping entered and cleared in 1918 was 6,607,565 tons, of which 4,975,698 were British. Ceylon possessed a merchant marine on Jan. 1, 1918, of 143 sailing vessels and seven steamers.

CHAFIN, EUGENE WILDER. Prohibition candidate for President in 1908 and 1912, died at Long Beach, Cal., November 30, as the result of an accident by fire. For many years he had been a temperance advocate of note and an organizer of temperance and prohibition movements. He was born at East Troy, Wis., on Nov. 1, 1852; educated in the public schools and studied law at the University of Wisconsin. Admitted to the bar in 1875, he practiced in Waukesha and Chicago. His political career as a Prohibitionist began with his candidacy for Congress in 1882. He subsequently ran for various other offices on the Prohibition ticket, at a time when success on that issue was impossible. He wrote *Lives of the Presidents* (1896) and biographies of Lincoln and Washington.

CHALMERS, ALBERT JOHN. British physiologist, died, April 5. He was born at Manchester, England, March 28, 1870, educated at the University Colleges of Liverpool and London, and served in many parts of the British colonial empire on various medical commissions. For his work in the West African and Ceylon services from 1897 to 1911 he was awarded a gold medal and received medals and orders also for his services in Ashanti and in the Ceylon coronation contingent. He was author of works on tropical medicine, physiological chemistry, hygiene, etc.

CHAMBERS, JULIUS. Editor and author, died in New York City, February 12. He was born at Bellefontaine, Ohio, Nov. 21, 1859; studied at the Ohio University and at the Columbia College Law School; joined the staff of the *New York Tribune* in 1870; and from that time on served in various capacities on New York papers including the *Herald* and the *World*. He had wide experience as a traveler, beginning with an expedition in his youth to the headwaters of the Mississippi River which he discovered in Elk Lake, Minn., and including voyages to Egypt, the West Indies, and the cities of Europe. After 1904 he contributed a daily department to the *Brooklyn Eagle*, entitled "Walks and Talks," and lectured on journalism at Cornell and New York universities. Among his writings may be mentioned: *A Mad World*; *The Mississippi River*; *The Destiny of Doris*; *Seeing New York*; and *Joy of Living*. He wrote a musical comedy entitled *The Nargasson Maid* and was the author of numerous short stories.

CHAMBER OF COMMERCE. See CITY PLANNING.

CHAPIN, ANNA ALICE. Author, died in New York City, February 26. She was born in New York City, Dec. 16, 1880; was privately educated, and studied music in New York City; married Robert Payton Carter in 1906. She wrote a number of works pertaining to the scores of Wagner and other musical subjects; fairy stories, plays, and novels. Among the more recent ones may be mentioned. *The Street Car Mystery* (1911); *The Spirit of the Sea* (a poem on the Titanic disaster, 1912); *The Eagle's Mate* (1914); *The Topsy-Turvy Fairy Book* (1914); *The Everyday Fairy Book* (1915); *Mountain Madness* (1915); and *Greenwich Village*.

CHARITIES. Work during 1920 in the charitable field progressed with more organization than in previous years. Special attention was given to work in Europe and especially among the starving populace in Slavic countries. Work in the United States has been directed with particular attention toward industrial centres. (See RED CROSS.) Extensive relief work at home has been done during 1920 by the Red Cross. Emphasis has been laid upon the field of health promotion and disease prevention.

DOMESTIC PEACE-TIME PROGRAMME. The new department of Health Service of the American Red Cross was in operation seven months of the fiscal year, during which time 128 health centres were in active operation, while 435 Red Cross chapters were engaged in some form of disease-preventing work. Six thousand certificates were issued to persons completing First Aid courses while 1500 new members were enrolled in the Red Cross Life-Saving Corps. Enrollment in the Red Cross Nursing Service increased during the year from 35,426 to 36,705. To help meet the shortage of public health nurses the Red Cross established 288 scholarships, in addition to 250 awarded by various chapters. The number of women and girls completing the Red Cross course in Home Hygiene and Care of the Sick increased during the year from 34,033 to 93,093. Students certified as the result of completing Food Selection courses totalled 1497.

In fulfilling its traditional function in the relief of victims of disaster 140 Red Cross chapters were in action during the year, 30,000 persons in 164 communities, victims of 73 disasters, being assisted. This work also involved the establishment of 30 temporary hospitals and 20 motor corps and the dispatch of seven Red Cross relief trains.

Under the banner "Happy Childhood the World Over" over 11,000,000 American school children enrolled in the Junior Red Cross during the year, performing many services for the comfort of World War veterans and children in hospitals and carrying on other civic undertakings, in addition to directly furnishing relief supplies and service for war victims overseas, particularly children.

THE AMERICAN ASSOCIATION FOR ORGANIZING FAMILY SOCIAL WORK, (formerly the American Association for Organizing Charity). This body enlarged its staff to cover two definite fields: The executive staff which consists of the director and an associate, has charge of the administrative end of the work, including publications such as pamphlets pertaining to family case work and the periodical, *The Family* (published monthly, ten times a year); the field staff now consists

of six under the direction of Francis H. McLean. Each of these field workers covers a definite territory with headquarters in the following cities: Denver, Chicago, Baltimore, New York and New Bedford. The field staff makes visits to such communities as need their services and works in the closest coöperation with the division offices of the Red Cross. The Association is composed of 186 variously-named societies in as many different cities, which share the same general principles of doing case work with families. These agencies meet certain requirements such as employing at least one trained paid worker; their boards of management are open to all in the community regardless of sect; and they have signed the transportation agreement which prohibits the "passing on" of dependents from one community to another on which they have no claim. During the past year the Association assisted in the organization or reorganization of 24 societies for family social work, and made visits of consultation to 112 others, as well as carrying out six special community surveys. The total number of cities advised by correspondence was 383.

NATIONAL CONFERENCE OF SOCIAL WORK. The 47th annual meeting of the National Conference of Social Work was held at New Orleans, April 14-21. This organization is made up of over 4000 leaders and workers in the social service field of the United States and Canada. Its primary purpose is to bring its members into annual conference for the exchange of experience and discussion of the problems of social work. The Conference has no platform and adopts no resolutions of findings or of social programmes. It has clung to the conviction that a mutual exchange of opinions is the more effective means of raising the standards of social service both public and private. Education rather than propaganda is its underlying purpose.

The success of the conference as a clearing house for social experience is indicated by the list of other organizations which held their meetings at the same time and place so as to get the advantage of discussion with others than those in highly specialized fields. At New Orleans, the following kindred groups were present: The Association of Training Schools for Professional Social Work, The American Red Cross, The American Association of Hospital Social Workers, The National Children's Home and Welfare Association, the Nation Probation Association, The American Association for Community Organizations, The Foreign Community Workers of the National Board of the Y. M. C. A., the American Association for Organizing Family Social Work, The National Child Labor Committee, The National Travelers Aid Society, and The National Conference of Jewish Social Service.

The conference meets in both general sessions, and as specialized divisions. In the latter, social workers divide along the lines of their specialties, and by discussion thrash out the differences that varying experience produce. The subjects of these divisions are: Children, Delinquents and Correction, Health, Public Agencies and Institutions, Family, Industrial and Economic Problems, the Local Community, Mental Hygiene, Organization of Social Forces, and United of Native and Foreign Born. Each general session is assigned to one of the divisions for the purpose of giving it an opportunity

to present its latest and most generally applicable discoveries to the whole body of social workers.

The National Conference at present is concerned with the relation of its own specialty to the other great social movements of the present day, such as public education, medical science, government, labor, law, and the church. It is recognized that further progress in social service depends upon the coöperation between all such forces—consequently the plans of the Conference for 1921 are to centre discussion on these community-wide obligations of social work. This is being made the keynote of the programme now planned for the next conference at Milwaukee, Wis., on June 22-29, 1921.

The officers of the Conference consist of an Executive Committee of fifteen members at large and the chairmen of the ten specialized divisions, and the President, three Vice-Presidents, Treasurer, and Secretary. For 1921 the officers are: President, Allen T. Burns; 1st Vice-President, Robert W. Kelso; 2nd Vice-President, Marcus C. Fagg; 3rd Vice-President, Mary E. Richmond; Treasurer, Charles W. Folds; and Secretary, William H. Parker. Headquarters are maintained at 522 Fifth Ave., New York City and the office of the Conference is at 23 East 9th St., Cincinnati, Ohio.

NATIONAL INFORMATION BUREAU. As a co-operative effort to protect the contributing public and to standardize the methods of national social, civic, and philanthropic organizations, the National Information Bureau, 1 Madison Avenue, New York, Barry C. Smith, Director, carried on during the year the work begun by the National Investigation Bureau in 1918. After a conference in the summer of 1919, at which leading social agencies were represented, the Bureau was reorganized so that it became representative not only of the contributing public, but also of organized social work. Its Board of Directors composed equally of representatives of both groups adopted standards which all social, civic, and philanthropic agencies seeking funds from the public on a national or interstate basis were invited to accept. These standards included an active and responsible board of directors, a legitimate purpose with no avoidable duplication, reasonable efficiency, no solicitations on commission or by the use of the remit or return method, no entertainments where expenses exceeded 30 per cent of the gross proceeds, ethical methods of publicity and promotion, agreement to consult and coöperate with the proper social agencies in local communities with reference to local programmes and budgets, complete annual accounts audited by a certified public accountant and the use of an annual budget. In the light of these standards, nearly 1400 agencies had been investigated by the Bureau up to the end of 1920. Five bulletins, listing social agencies approved after investigation, were issued and 4500 special confidential reports relating to particular organizations were sent to inquirers. The Bureau is financed by membership fees and contributions from individuals, corporations, philanthropic foundations, community chests, charity federations and chambers of commerce. No fees are accepted from organizations whose work brings them within the Bureau's field of investigation. On October 1st, under the joint auspices of the Bureau and a committee of the National Conference of Social Work, a confer-

ence of national social agencies was held in Washington to consider possibilities of increased coordination of their work. Steps were taken as a result of this conference to prepare a concrete programme which was to be developed during 1921. In November, the Director of the Bureau went abroad to make a first-hand study of American relief work in Austria, Serbia, Poland, and Germany.

For further information on charity work, see also RED CROSS, Y. M. C. A., Y. W. C. A., ROCKEFELLER PHILANTHROPIC BOARDS, COMMUNITY SERVICE, and RELIEF FOR WAR VICTIMS. The reader should also consult JUVENILE COURTS, and articles referred to under Social Economics.

CHAUTAUQUA INSTITUTION. This institution was founded in 1874, and now carries on its activities under three general heads: (1) the public Assembly, with an educative though necessarily popular series of lectures and addresses, dramatic and other entertainments, concerts, etc., continuing through eight weeks each year. In the aggregate there is an annual attendance of 50,000 persons; (2) the Summer Schools, offering formal classroom instruction in a great variety of subjects, under 13 departments, for six weeks annually, and enrolling over 3000 students; (3) and the Home Reading work, presented in a set of four books and the news narrative appearing regularly in some weekly review, at present *The Independent*. The teaching element is supplied by a monthly bulletin, *The Round Table*. This department, which operates throughout the year, has an official enrollment of about 10,000, but the number of readers is much larger.

The forty-seventh Assembly was held during the months of July and August, 1920 at Chautauqua, N. Y., and proved a great success. Among the subjects of the lectures given were: "Modern Literary Tendencies," by Prof. Richard Burton; "Aftermath of the War," by Herbert Adams Gibbons; "A Study in Economic and Moral Aspects," by Dr. Edward H. Griggs; "The Jew in Modern Fiction," by Rabbi Louis Wolsey; and "Woman and the New Era." The Summer Schools were 25 per cent ahead of last year in income and from 15 to 20 per cent ahead in the number of registrants. A country club house is to be erected before the Assembly opens next summer. It is the gift of Mr. and Mrs. S. I. Munger. The Comprehensive Plan for the purpose of raising \$600,000 which was inaugurated in 1919, was brought to a close, although but \$450,577.99 was raised. The Institution plans to get the remaining \$150,000 during 1921 by private subscription, and does not feel discouraged because the set goal has not yet been reached. Of what has been raised, \$75,096.33 was given by John D. Rockefeller. Mr. Arthur E. Bestor is President of the Institution.

CHEESE. See DAIRYING.

CHEMICAL INDUSTRIES. See CHEMISTRY, INDUSTRIAL.

CHEMICAL SOCIETY. See CHEMISTRY, INDUSTRIAL.

CHEMISTRY. The progress of chemistry during the year fails to reveal any remarkable discovery that tends to advance the science in a conspicuous way; moreover the laboratories of the great universities of Central Europe have not as yet fully resumed the publication of the results of the investigations undertaken in them, and in the English-speaking countries the

work of industrial corporations where by far the greatest advances are now being made, is not apt to be given to the public or appear in scientific journals. Nevertheless, the literature of chemistry is steadily on the increase and more journals devoted to it are issued than ever before. From among the many papers that have been published during the year a few have been selected to indicate the character or trend of the progress made.

In general three papers may be mentioned as of value in summarizing existing knowledge on the topics of which they treat. They are "Charcoal before the War," by Wilder D. Bancroft of Cornell University. This study is in three parts and appears in successive issues of the *Journal of Physical Chemistry*. Also see "War Experiences in the Manufacture of Nitric Acid and the Recovery of Nitrous Fumes," by James Walker, and "Helium: its Production and Uses," by John C. McLennan. Both were delivered before the London Chemical Society and appear in its Transactions (pp. 382-389 and pp. 923-947 respectively).

ATOMIC WEIGHTS. In the Annual Report of the International Committee on Atomic Weights for 1920-21 reference is made to studies on these values for the elements fluorine, silicon, lead, tin, tellurium, scandium, and samarium. The only change in the table is in the case of scandium which in view of the evidence presented, is increased from 44.1 to 45.1.

ANALYTICAL CHEMISTRY. I. Bellucci, an Italian chemist, finds that one mg. of cobalt in solution may be detected color-metrically in 1 to 2 litres of water by means of alpha-nitro-beta-naphthol, and in about 17 litres of water by means of beta-nitro-alpha-naphthol. He also finds that one mg. of nickel in 4 to 5 litres of water may be detected by means of dimethyl glyoxime. A new manometric ureometer is described by Paul Bobay. Its principal features are a piston with ground surface fitting into the base of the ureometer and the addition of a manometric tube to the graduated tube. D. Ganassini under the title of "New Color Reactions of Quinine" says that a yellow coloration which becomes rose and finally purplish red is developed, when a few drops of pyridine are added to a solution of quinine or of a quinine salt containing a slight excess of freshly prepared chlorine water. A French chemist, G. Demigès, recommends the use of iodic acid as a micro-chemical reagent for soluble and insoluble compounds of calcium, strontium, or barium; for he finds that a 10 per cent aqueous solution of this acid gives almost immediately finely crystalline characteristic precipitates of calcium, strontium, or barium iodate with salts of these metals. F. C. Fuchs, under the title of "A Test for Molybdenite," recommends that the mineral be dissolved in fused potassium hydroxide. If molybdenum sulphide is present, it dissolves with an intense red color. If the fused mass is cooled and dissolved in water, the color changes to blue, green, yellow, etc., corresponding with the various stages of combination of molybdenum. A single method for detecting human blood on a knife-blade or other non-absorbent surface, recommended by Angelo de Dominicis, consists in pouring on to the spot a very dense solution of celluloid in amyl acetate, allowing the solvent to evaporate, removing the dry pellicle by means of

needles and examining under the microscope the superficial layer of blood on the pellicle. If the latter cannot be removed from the blood-stained surface, it may be first thickened by a second application of the celluloid solution. An elaborate study on the Estimation of Phosphoric Acid, by Hans Kleinmann appeared during the year. It was divided into five parts as follows: 1, The Estimation of Phosphoric Acid as Magnesium Ammonium Phosphate and the Hindrance of its Precipitation by the Serum Constituents. The Estimation of Phosphoric Acid as Uranium Phosphate and as Silver Phosphate. 2, The Estimation of Phosphoric Acid in Phosphomolybdates. Gravimetric and Colorimetric Methods. 3, The Estimation of Phosphoric Acid in Phosphomolybdates. Volumetric and Sedimentic Methods. 4, The Estimation of Phosphoric Acid as Strychnine-Phosphoric Acid-Molybdenum Compound (Nephelometry). The General Principles of Nephelometry and the Construction of a New Nephelometer. 5, The Estimation of Phosphoric Acid as a Strychnine-Phosphoric Acid-Molybdenum. Special Phosphoric Acid Nephelometry and a New Method of Preparation of the Strychnine-Molybdenum Reagent. These topical headings clearly indicate the great value of this contribution to the use of this important reagent. During the year the United States Geological Survey published as a bulletin, W. F. Hillebrand's "Analysis of Silicate and Carbonate Rocks," which is a general treatise on the analysis of rocks. Methods are described for the separation and estimation of the common and rare constituents of the rocks, and only those methods that have been found to be trustworthy are recommended. Attention is called to the frequent occurrence of boron in rocks, especially as the estimation of this element has usually been neglected.

INORGANIC CHEMISTRY. Our knowledge of the composition of the atmosphere is still quite uncertain, especially in regard to the hydrogen and the relation between oxygen and nitrogen. Accordingly August Krogh undertook a study of the variation in the mixture composing the atmosphere at different altitudes, designing special gas apparatus for his work. He found that the percentage of carbon dioxide in the streets of Copenhagen was usually increased by 0.001 to 0.007. The absolute composition of the atmospheric air at the earth's surface is CO_2 , 0.030; N_2 , 79.022; and O_2 , 20.948.

The important subject of the Electric Deposition of Nickel was studied by L. D. Hammond whose experiments show that although cast-nickel anodes corrode fairly well in simple sulphate solutions to which boric acid has been added, the best results are obtained when the purest electrolytic nickel in nickel sulphate solutions containing chloride is used. The substitution of nickel ammonium sulphate by nickel sulphate in nickeling baths is recommended. To ensure a good deposit of nickel it is essential that the bath should be slightly acid, and for this purpose boric acid has been found desirable. Metals which yield surface colors become coated with a film of oxide, the rate of thickening of which with the time can be estimated by the alteration of the surface colors. Certain metals yield similar colors with iodine vapor at ordinary temperature, and these are particularly suitable for the experimental investigation of the laws governing the rate of

formation of the surface layer. To this subject G. Tammann devoted much time and has given in an elaborate paper his results typical of which is the following: A strip of silver shows three different types of behavior toward iodine according to whether it has been rolled and cleaned, has been melted and thus covered with larger crystallites, or has been left unworked and thus covered with multitudinous, small, dendritic crystals. Triatomic Hydrogen was made the topic of an investigation by Gerald L. Wendt and Robert S. Landauer. These authors have produced a reactive modification of hydrogen by three methods all of which are dependent on gaseous ionization, as follows: by the alpha-rays from radium emanation; by an electrical discharge under reduced pressure; and by the high potential corona at atmospheric pressure. After describing its properties a conclusion is reached that as positive ray analysis at very low pressures shows a large proportion of triatomic molecules which are undoubtedly the molecules responsible for the chemical activity, hence there exists a gas of an ozone form which properly may be called "hyzone." A. C. Vournazos describes "A New Series of Complex Compounds," which he calls antimonyoxyiodides. He finds that when antimony tri-iodide is decomposed by water to produce antimonyoxyiodide there is an indication of the intermediate formation of an unstable complex acid ($\text{H}_2(\text{SbOI}_4)$) of which he prepared the corresponding mercury and copper salts. The properties of these salts are described. The "Crystalline Structure of Antimony" has been studied anew by R. W. James and N. Tunstall by means of an X-ray spectrometer, using a bulb with a palladium anticathode. The glancing angles for first-order spectra were found to be as follows: (100), $5^\circ 27'$; (110), $7^\circ 24'$; (110), $7^\circ 50'$; (111), $4^\circ 26'$; and (111), $19^\circ 14'$. Eric K. Rideal and Jacob Kunz investigated the Distribution of Ozone in the Direct Current Corona. After discussing the theoretical formation of ozone by various methods in the light of the different radiation hypotheses, and the conclusion reached that molecular species of a given type may be activated to varying degrees by a given radiation, the experimental distribution of ozone in a direct current corona is reported on. A conclusion is reached that the ultra-violet light emission from the corona exceeds that of the visible light, and in the corona itself the ratio of ultra-violet light to visible light is exceedingly high. A valuable contribution to this branch of chemistry was made by V. Kohlschütter and J. L. Tüscher on Topochemical Reactions," with special reference to the Formation and Behavior of Copper Hydroxide. A topochemical reaction is defined as one which depends on the relative position in space of the reacting groups or molecules. A long account is given of the various methods of preparation of copper hydroxide and the properties of the various products. In particular the loss of water from the hydroxide to form oxide and partly dehydrated hydroxides is considered. A paper of unusual importance on the Salts of Stannic and Plumbic Acids by Hans Zocher is worthy of mention. This study was undertaken for the purpose of elucidating the so-called semi-colloidal state, and after a critical discussion of this condition the methods for preparing and analyzing alkali stannates are described. He concludes that: The low crystal-

lization velocity of the oxide, resulting from its slight solubility, facilitates its assumption of the colloidal state. The "aging" of the colloid is accelerated or retarded by various influences, particularly by accompanying salts in solution. Coagulation, that is, the coalescence of the bounding surfaces of the colloidal particles in solution, is retarded by the electrostatic charge on the particles. The work was also extended to the plumbates.

MINERALOGICAL CHEMISTRY. Much of the recent work in this branch of chemistry has been either in crystallography or concerning the optical properties of minerals which cannot be discussed here. An important study, "The Genesis of Petroleum as Revealed by its Nitrogen Constituents," by Charles F. Mabery, is worthy of mention. He finds from an examination of 21 specimens of petroleum evidence that justifies the conclusion that nitrogen is contained in the petroleum of all the principal oil fields in forms of combination which could only have had their origin in the remains of vegetable or animal bodies. Presumptive evidence has been shown that the associated hydrocarbons in petroleum had the same origin. Villamaninite is a new mineral announced by W. R. Schoeller and A. R. Powell from the Carmenes mines, near Villamanin, Spain. It is a copper, nickel, cobalt, and iron sulphide with part of the sulphur replaced by selenium. Other new minerals include brannerite, a new uranium mineral from the gold placers in Stanley Basin, Idaho. It was described by Frank L. Hess and R. C. Wells. Its composition is very complex and is expressed by the formula $6(\text{Ca}, \text{Fe}, \text{UO}, \text{TiO})\text{TiO}_3 \cdot 8(\text{Th}, \text{Zr}, \text{UO})\text{Ti}_2\text{O}_7 \cdot \text{Yt}_2\text{Ti}_2\text{O}_7 \cdot 3\text{H}_2\text{O}$. Bismutoplagonite is a new lead bismuth sulphide with the formula $5\text{PbS}_4\text{Bi}_2\text{S}_3$, described by Earl V. Shannon from Wickes, Montana. Zebedassite is a new hydrated aluminum and magnesium silicate with the formula $4\text{H}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 5\text{MgO} \cdot 6\text{SiO}_2$, described by Amalia Brusoni from Zebedassi in the Pavian Apennines. G. Flink published an account of a new lead manganese vanadate from Longban, Sweden, to which he gives the name Pyrobelonite. Ultrabasite is the name of a new mineral from Freiberg, Saxony, described by V. Rosicky and J. Sterba-Bohn. It is an antimony silver, lead, germanium sulphide with the formula $\text{Sb}_4\text{Ag}_2\text{Pb}_2\text{Ge}_2\text{S}_{12}$.

ORGANIC CHEMISTRY. A notable development that is conspicuous among the papers devoted to this branch of chemistry that have been published this year is the fact that in many of the laboratories extensive investigations extending over a series of years are now in progress. In other words discussion of groups is becoming more prevalent, rather than of some one individual compound. The very great and extensive ramifications of organic chemistry makes it practically impossible to adequately cover the enormous amount of research now being carried on.

Some of the larger papers now in progress include the following: Emil A. Werner is studying "The Constitution of Carbanides," and his twelfth paper was on "The Decomposition of Urea when Heated in Solution in the Presence of Acids." "Changes in the Physical State of Colloids," by Richard Wagner has reached its twenty-fourth paper which bears the subtitle of "Precipitation of Protein by Acids and Alkalis." T. Sabalitschka published his fifth paper on the

"Decomposition of the Acid Salts of Dibasic Acids in Aqueous Solution." "Keto-enolic Desmotropy," by Kurt H. Meyer and V. Schoeller is of like character and reached its twelfth part on "The Fractional Distillation of Ethyl Acetoacetate. The series on "Halogenalkylated Aromatic Amines," by J. von Braun and G. Kirschbaum attained its fifth issue on the Preparation of Aryl Vinyl Ethers. The very longest of these continued papers was by Rudolf Wegscheider on the "Esterification of Unsymmetrical Di- and Poly-basic Acids," the thirty-third part of which bore the subtitle of "Esterification of Aminodicarboxylic Acids." The eighth paper on "Methyleneanthraquinone," has been published in the valuable researches on "Anthracene," by Kurt H. Meyer. Heinrich Wieland with various associates has been studying the ditertiary hydrazines, and with E. Haas completed the twelfth paper in the series on "Ditertiary Hydrazines, of the Quinoline Series." An important contribution is that on "The Theory of Electrolytic Ions," by R. Lorenz and E. Schmidt, of which the 17th paper was on "The Conductivity of the Sodium Arsenates."

Among other papers of importance are the following: under the title of Rhodanines, Ch. Gräbner has undertaken to elucidate the constitution of Nencki's rhodanine red, but great difficulty was experienced in purifying the dye, since it could not be made to crystallize, and analyses of the product moreover showed it to be more complex than was anticipated. It was however demonstrated that the imino-hydrogen of the rhodanine is not concerned with its oxidation by ferric chloride, since N-substituted rhodanines, such as 3 phenylrhodanine, also yield red dyes under suitable conditions. Ossian Aschan contributed to the chemistry of synthetic rubber a paper on New Hydrocarbons of High Molecular Weight from Isoprene. It is not altogether new but it was not until early in the year that it became available in English. The additive capacity of caoutchouc shows that one double bond of isoprene disappears in its formation, and is utilized in uniting the condensed isoprene molecules. The molecules which are thus formed by purely chemical reaction are subsequently united to greater complexes, probably by physical and secondary chemical forces (such as residual affinities). According to Aschan, therefore, two processes are operative in the formation of caoutchouc, which differ from one another not only in respect of rapidity, but also of nature, namely, first, a purely chemical condensation involving certain ethylenic bonds in isoprene and leading to new carbon compounds, and secondly, formation of greater complexes from the simplest caoutchouc molecules so formed which does not involve the production of carbon compounds in the ordinary sense. The latter process only takes place gradually, and is probably never complete; it constitutes the so-called polymerization of caoutchouc. The converse process, depolymerization, occurs when caoutchouc forms additive products and when it is dissolved, particularly in hot solvents. The Periodides of Carbonyl Compounds is the title of an investigation by A. M. Clover, who, after reviewing the isolated instances in the literature of periodides derived from organic compounds from nitrogen, concludes that it is the carbonyl group which is essentially involved in their structure, and suggests the designation "carbonyl periodides," including

among them the periodides of dimethyl and tetramethyl pyrones, and of amides and anilides. The Biochemical Preparation of Sucrose from Gentianose is reported by E. Bourquelot and M. Bridel. These authors find that by the action of emulsin, freed as completely as possible from invertase, on a solution of gentianose, a mixture of dextrose and sucrose was obtained. The dextrose was then converted into beta-methyl glucoside and the sucrose isolated in a pure crystalline state. Amé Pictet and Pierre Castan have studied anew the interesting brown amorphous substance which in 1860 Gélis obtained by heating dextrose at 170° and named Glucosan. They find that this compound can be obtained in a pure crystalline state if the dextrose is heated at 150°-155° under a pressure of 15 mm. Thus obtained it has a melting point of 108°-109°, is very deliquescent, and has $(\alpha) + 69.8$ in water. They find it has the formula $C_6H_{12}O_6$.

The weight of a Normal Litre of Propane was determined by J. Timmermans who prepared his propane by the action of sodamide on propyl iodide and by the action of sodium on butyronitrile. The weight of a normal litre of the gas, prepared by either method, was found to be 2.02 grams. The successful Synthesis of Pelargonidine was accomplished by R. Willstätter and L. Zechmeister in five steps resulting in a chloride identical in composition, crystalline form, solubility, reaction, and absorption spectrum with the chloride of natural pelargonidine. Other papers include the Syntheses of Humic Acids by W. Eller and K. Koch. In this it is shown that the oxidation of phenols in alkaline solution leads to the formation of substances which appear to be identical in all respects with the natural humic acids; only such phenols, however, as are capable of giving quinonoid intermediate products present this behavior. The acids are obtained by allowing the alkaline solutions of the phenol to remain exposed to the air, or more rapidly, by the addition of finely powdered potassium persulphate to the solution. Th. Bokorny has investigated The Chemical Nature of Enzymes by estimating the alkylamino-nitrogen in a number of well-known enzymes by means of nitrous acid. The amino-nitrogen was found to vary from 3.05 per cent in rennet to 7.66 per cent in papayotin. The results obtained seem to favor the theory of the protein nature of enzymes.

PHYSIOLOGICAL CHEMISTRY. An interesting contribution to this branch of chemistry is by H. Teudt on the Origin of Odor. He presents the causes and deduces the theory that odor is developed by setting the valency electrons within the molecule into vibration. The elaborate investigations of the Physiology of Glands, by N. Danoff has reached its 38th publication which is devoted to the Influence of the Spleen on the Respiratory Metabolism. He finds that the respiratory metabolism of small animals is higher per unit body weight and time than that of larger animals, and that it rose as the surrounding temperature sank. A very complete study of the Active Principles of the Pituitary Gland, by H. W. Dudley shows that the extract contains all the uterine stimulant together with some of the pressor substance and contaminating substances. The view expressed by Abel and Kubota that histamine is identical with the uterine stimulant is not confirmed, owing to the many differences observed in the properties of these two

substances. Sinicha Giaya finds the invariable presence of zinc in the viscera of a number of corpses examined by him, the proportion increasing with age. The chemical nature of the bee's poison has been carefully investigated by Ferdinand Flury, who finds that the principle is a base of complicated constitution. By means of digestive processes, a considerable fraction of a lipid nature was obtained from it. The following were the products of hydrolysis with hydrochloric acid: (1) a ring compound of the indole series; (2) choline; (3) glycerol; (4) phosphoric acid; (5) palmitic acid; (6) a high molecular, non-crystallizable, unsaturated fatty acid; (7) a volatile fatty acid, presumably butyric acid; (8) and a nitrogen-free fraction. The latter fraction was found to be the pharmacologically active principle of the bee's poison. According to the method of isolation, it can be obtained either as a neutral compound sparingly soluble in water or as an acid soluble in water. The author expresses the opinion that the bee's poison in the natural secretion is present as a complex compound in combination with lecithin and a basic fraction. H. Hartridge whose activity in all matters pertaining to physiological chemistry is so great, announces that positive results indicate the possibility of there being in a heavy smoker a condition of chronic carbon monoxide poisoning. W. Plotz finds after a number of experiments that the chlorine derivatives of methane, ethane, and ethylene show that the hæmolytic activity of these compounds is proportional to their molecular weight and to the number of chlorine atoms. The extensive Vitamine Studies by R. A. Dutcher, E. M. Pierson, and A. Biester were continued during the year and their fifth joint paper on The Antiscorbutic Properties of Raw Beef gives the results of experiments with diets on guinea pigs, especially with extracts of raw lean beef. No scurvy was developed in consequence of the diet used. According to André Mayer and Pierre Morel pulmonary tissue contains an enzyme which hydrolyses esters and glycerides, and has properties different from those of pancreatic lipase. In a study on the Water-soluble Vitamins, A. D. Emmett and G. O. Luros considered the question as to whether the antineuritic and the growth-promoting water-soluble-B vitamins are the same. As the antineuritic factor appears to be more readily decomposed by heat, these authors conclude that tentatively they are different. Wilhelm Stepp describes substances possessing the properties of aldehydes which he found present in the blood of some diabetic, nephritic, and other patients. These substances form iodoform with iodine in alkaline solution, and reduce Fehling's solution as well as ammoniacal silver, and give a red coloration with magenta-sulphurous acid.

CHEMISTRY, INDUSTRIAL. The conspicuous feature of the year's progress seems to be a tendency towards the establishment of a greater supervision of the development of chemical industry under official government auspices. Such a tendency has been shown not only in the United States and Great Britain but also in France, Italy, Belgium, and Japan. The Belgian movement is typical, and that nation has provisionally approved the establishment of a national system for encouraging scientific and industrial research.

ORGANIZATIONS. The American Chemical So-

ciety held its spring meeting in St. Louis, Mo., during April 12th-17th. The annual meeting was held in Chicago, Ill., during September 6th-10th. The Constitution was amended by increasing the dues from \$10 to \$15 a year. The membership is reported as 15,506. Four new sections, known as the Savannah (Ga.) Section, the South Jersey, the Colorado, and Omaha (Neb.) respectively were created. The president during the year was Prof. William A. Noyes. The American Electrochemical Society held its spring meeting in Boston and Cambridge, Mass., during April 8th-10th, and the general meeting in Cleveland, Ohio, during September 30th-October 2nd. The membership is 2307. The president during the year was Walter S. Landis. The American Institute of Chemical Engineers met twice as usual. Its summer meeting was held in Montreal, Canada, during June 21st-26th and its annual meeting in New Orleans, La., during December 6th-9th. The president during the year was David Wesson. The New York section of the Société de Chimie Industrielle continued its regular sessions during the year. Its president was Dr. L. H. Baekeland.

The Society of Chemical Industry held its 39th annual meeting in the Chemical Lecture Theatre of Armstrong College in Newcastle, England, during July 13th-16th under the chairmanship of Prof. Henry Louis who occupied the chair on account of the illness of John Gray, the president during the year. The membership was reported as 5612 as against 5236 last year. The annual subscription was increased from 30 shillings to 2 pounds, 10 shillings. Prof. Henry Lewis was elected foreign secretary and Sir William J. Pope, president. Montreal, Canada, was chosen as the meeting place for 1921.

INTERNATIONAL ORGANIZATIONS. The third session of the International Chemical Conference was held in Rome, Italy, during June 21st-25th with Prof. Charles Moureu as president. The programme began with the meeting of the International Union of Pure and Applied Chemistry consisting of the representatives of the five nations that founded the union. Canada, Czechoslovakia, Denmark, Greece, Netherlands, Portugal, and Spain were admitted to the Union. Also a plan of organization and administration was adopted, an important feature of which was the provision that every four years the International Conference shall be converted into an International Congress of Pure and Applied Chemistry. The representative from the United States was Dr. Charles L. Parsons.

NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES. The sixth National Exposition of Chemical Industries was held in the Grand Central Palace, New York City, during the week of September 20th-25th. The exhibits numbered 484 and were largely devoted to the exploitation of the growing development of American dyes, although important exhibits of medicines and of paper products were also shown. At its close it was said that "no other exposition of its diversity and magnitude had ever been held in Germany or any other country." Throughout the week lectures on technical subjects connected with the exhibits were given every afternoon and in the evenings there were shown films illustrating chemical processes. More than 125,000 persons visited the exposition, which represents a record-breaking attendance. One important phase of the development of chemical industries

deserves mention. It was said that there "was ample evidence that German chemists and manufacturers already were at work deriding American products, particularly dyestuffs, with the idea that a gullible buying public might be made to provide a 'dumping ground' for German products." It was the belief of the members of the Advisory Board of the Chemical Exposition that "the Germans while working covertly at their programme of tearing down the reputation of American products, would make their first public bid for American chemical markets by thrusting in a large number of exhibits at the Chemical Exposition and other public shows." Accordingly it was decided that "no German firm, nor any American firm with German affiliations would be permitted to have exhibits" in the Seventh Annual Exposition of the Chemical Industries which will be held in New York City in September, 1921.

RELATIONS OF CHEMISTRY TO THE UNITED STATES AND OTHER GOVERNMENTS. It is desirable to mention that the Bureau of Chemistry in the Department of Agriculture is more and more called upon to consider possibilities in factory waste products which have resulted in finding processes by which valuable products may be saved. The difficulty that then presents itself is that of getting the discovery developed commercially. Unless the new process can be offered to the manufacturer well stripped of theory, it is likely to be received indifferently. Accordingly a new "office of development work" was created which has for its function business service. It will act as the go-between from science to industry. A force of trained engineers will take up each fresh project as fast as it has passed the experimental stage in the government laboratories and attempt to develop its commercial possibilities. It will furnish reports covering everything from the source and availability of the raw material supply to plans on the nature of machinery needed, size of plant, capacity of plant, cost of production, and market demand for the finished material.

On October 15th, a joint meeting of the American Institute of Chemical Engineers, the American Section of the Society of Chemical Industry, and the New York Sections of the American Chemical Society and the American Electrochemical Society was held in New York City at which under the title of "Proposed New Departures in Government Chemical Work," addresses were made by Dr. S. G. Cottrell of the Bureau of Mines and Dr. Carl Alsberg of the Bureau of Chemistry, followed by a full discussion of the subject.

Of like character in Great Britain is the formation of combinations or associations of specific trades for the purpose of research work under the Government's plan, whereby \$4,866,500 is made available for industrial research. Research associations have been formed in connection with chocolate, cocoa, sugar, confectionery, jam, boot and shoe and allied trades, cotton, sugar, iron, motor and allied manufactures, photographic materials, Portland cement, woollens and worsteds, scientific instruments, india rubber and tires, linen, and glass industries. The scientific and industrial research department has given its sanction to the formation of similar associations for refractory materials, nonferrous metals, and Scottish shale oil. Other trades or industries whose applications have been made for the de-

partment's approval include launderers, electrical and allied industries, and makers of aircraft. Silk manufacturers, leather trades, master bakers and confectioners, and manufacturers of adhesives have under consideration details of proposed associations. Before any association can come under the government scheme, the approval of the scientific and industrial research department must be obtained, and subsequently a license must be secured from the Board of Trade. The associations must be national in character and include the bulk of the manufacturers in any specified industry. Reports have been received in which similar relations are described to be either at work or under consideration in France, Italy, Belgium, and Japan.

MEDALS. On January 10th, the Perkin Medal of the Society of Chemical Industry was presented to Prof. Charles F. Chandler, the emeritus professor of chemistry at Columbia University. The William H. Nichols medal of the American Chemical Society was on March 5th presented to Dr. Irving Langmuir of the General Electric Company for his paper on "The Arrangement of Electrons in Atoms and Molecules." In recognition and encouragement of his eminent researches in theoretical and applied chemistry, and more especially in appreciation of his process for neutralizing noxious fumes from smelters, the Willard Gibbs Medal of the Chicago section of the American Chemical Society was on May 22d presented to Dr. Frederick G. Cottrell of the Bureau of Mines. On September 27th, the Grasselli Medal of the American Section of the Society of Chemical Industry was presented to Dr. Allen Rogers of the Pratt Institute, Brooklyn, N. Y., for his paper on the "Industrial Uses for the Shark and Porpoise" which was accepted as containing the most useful suggestions in Applied Chemistry during the year. The medal of the Society of Chemical Industry in Great Britain was awarded to M. Paul Kestner, the distinguished technologist of France, in recognition of his valuable contributions to chemical industry.

METALS, ALUMINUM. Owing to the shortage of copper in Germany during the world war, every effort was made to find suitable substitutes and to employ them in the most extensive manner. Aluminum was one of the substitutes which was used to a large extent. In 1904 the total German consumption of this metal was 2000 metric tons; in 1913 it was 10,000 tons. The substitution of aluminum for copper, in the preparation of alloys, and in the manufacture of motor cars and trucks, machinery and utensils, at the end of the war brought the estimated annual consumption of aluminum for these purposes up to 16,000 metric tons; furthermore, 4000 metric tons were used in the manufacture of aircraft explosives, heavy machinery, etc., and 12,000 tons for the manufacture of electrical apparatus, fixtures, and machinery, making a total estimated annual consumption of about 32,000 metric tons. In order to secure sufficient supplies of aluminum it was found necessary not only to promote the building of three factories in Germany, but also to conclude a contract with the Aluminum-Industrie Aktien-Gesellschaft of Neuhausen, Switzerland, for the purchase of a further large amount. This contract is understood to have been so worded that Germany was compelled to accept delivery of a considerable quantity of aluminum during 1919 and 1920, at

a price expressed in Swiss francs. As the German factories are now producing more than enough aluminum to supply domestic requirements, efforts were made to cancel the Swiss contract. After several months of negotiations the Neuhausen factory has effected a compromise with the German War Metal Company, whereby the latter pays the former 11,000,000 Swiss francs in order to cancel the contract.

MAGNESIUM. An interesting statement comes from Norway to the effect that at the new salt works in Bergen by means of electric power applied to the treatment of sea water, 100 tons of metallic magnesium can be obtained annually. As the present total yearly production of that metal is 400 tons, the increase is an important one.

TUNGSTEN. The demand for tungsten during the world war led to the exploitation of the mines in China, especially at various localities in the southern part of the country. With the cessation of hostilities the demand for this metal diminished and up to August, 1919, tungsten ore was wholly an export product. China had no way of utilizing the ore. A plan was formulated for establishing a plant at Hankow for making ferrotungsten, but the proposition was postponed owing to the inactivity of the tungsten market. It is understood that there is a small smelting plant at Dalny, which is in an experimental stage.

It is said that a Norwegian firm worked out during the war a general process for reducing tungstic acid into tungsten powder and molybdenum sulphide into metallic molybdenum. It is claimed that the final products, which are in the form of small tablets, are of superior quality, being free from sulphur, carbon, or oxygen. Also the price for converting the ores into metal is lower than by any other method known.

STEEL. The invention of a new steel, far in advance of any high-speed steel hitherto made, is ascribed to John Oliver Arnold of Sheffield University, England. The inventor, who is said to have been the discoverer of vanadium steel, claims that the new steel possesses valuable and commercial possibilities, that it is unrivaled in hardness, that in tool form it will remove a greater weight than any other steel, and that it possesses comparatively longer life. Later came the information of a similar invention in France for which it was claimed that hard steel-nickel, chromium, manganese, and other kinds could be manufactured at the same cost as ordinary Bessemer steel, with only the added expense of the alloys involved. The process was described as follows: There was an ordinary furnace packed with coal and iron. The metal was fused at a relatively low temperature and then passed to a furnace, where the temperature was raised to 1500 degrees Centigrade and the impurities burned out. By the Bessemer process a relatively small percentage of impurities, chiefly phosphorus and sulphur, is eliminated. The result is that Bessemer steel is suitable for only ordinary work and cannot be employed as raw material for the high grade steel necessary for many phases of industry. The essential feature of the new process is that by the addition of certain secret substances and by means of a certain undivulged process the ordinary Bessemer steel process can be applied to produce steel as pure as that derived electrically. Attention is called to the fact that ordinary Bessemer steel because of the impuri-

ties of the metal, wears badly and irregularly. Hard steel having a much longer life can be made to bear the same strains with very much less content of material and thus the country that is able to produce high grade steel at the cost of ordinary steel will benefit by the immensely increased output. Later came an account of an improvement of the acid Bessemer steel process which aims to reduce the cost of making steel and to decrease the possibility of low quality steel in the process, which was invented by Prof. Richard S. McCaffery of the University of Wisconsin. The purpose of this invention is to use basic material for the lining of the Bessemer converter, instead of the acid lining now used, in order to prevent corrosion of the interior of the converter and to reduce the amount of air pressure and engine power now required. With the basic lining, composed of lime, magnesite, dolomite, oxide of iron, or the like, McCaffery believes that it will be possible to use lower pressure and cut down the time of blowing about 30 per cent. His invention is based on his discovery of the formation, character, and action of certain oxides formed by the air blast blown into the molten iron. The acid Bessemer process is now carried on in a converter with an acid lining, on the theory that this reduces corrosion by the acid slag that is formed. He has found, however, that the acid slag floats to the top and that the serious corrosion of the converter bottom is caused by oxides which are formed by the air blown into the converter and which, being basic, corrode the bottom. To prevent this corrosion, he proposes different kinds of linings for various acid Bessemer converters and describes the particular parts of the converter that require such a basic lining, while the remainder of the converter has an acid lining to resist corrosion by the acid slag.

POTASSIUM. The result of the war has broken the former German world monopoly of potash, since by the terms of the Peace Treaty the 13 Alsatian works passed into the control of the French state. Although the output of Alsace, as compared with that of Germany, is relatively small, it is nevertheless important enough to affect prices on the world market. During 1919 Alsace produced 40,000 metric tons of potash, while the output for 1920 was five times that amount. The total sales of the German potash syndicate during 1919, in which 198 works participated, amounted to 812,000 metric tons of potash, and the output is capable of great development. Concerning this newly arisen competition it is said that neither in France nor Germany has the producing industry any interest in lowering prices by competition. In view of present economic conditions, it is to the benefit of both countries to develop their export at the best possible prices. An agreement between France and Germany as to potash prices would therefore be to the advantage of both. Negotiations by Germany with France with the object of coming to an agreement regarding the Alsatian potash industry have been entered into. On political grounds, and in consequence of the unfavorable state of their currencies, sales by Germany to Poland and Czechoslovakia have almost entirely ceased.

The following report of a process for the collection of potash from cement dust in the course of the manufacture of Portland cement comes from Dalen, Norway. The new potash factory

was originally planned as a means to dispose of the dust which arose during the process of making cement. It is in close proximity to the smokestack of the cement factory. Potash-holding particles contained in the cement dust are carried out with the smoke and caught and separated. A trap-door arrangement forces the smoke into the potash factory, where it is conducted by means of a tube into the upper story of the factory. The smoke is then forced into a series of smaller tubes, in which it is subjected to an electric current of about 70,000 volts, the result being that the particles of dust are attracted to the side of the tubes or the electric wires placed in the tubes. At certain intervals the tubes are pounded so that the accumulations of dust descend into large bins, from where the dust is sacked, ready to be placed on the market immediately. The output of the factory will be about 30 tons a day, and in time will be able to satisfy a large part of Norway's requirements. The potash is not entirely clean, since it is mixed with cement dust which contains a high percentage of potash. The other ingredients are also of importance for agricultural use.

NITROGEN. It is interesting to note that the final report of the British Nitrogen Products Committee recommended the framing of a co-ordinated policy for safeguarding the future nitrogen requirements of the Empire, and urged that this should be done by imperial authority. It was suggested that as the existing information as to future prospects and possibilities will require to be supplemented before such a policy can be framed, advisory bodies should be set up to examine the local aspects of the nitrogen problem and to furnish the imperial authority with the requisite data. Great stress was laid on the vital importance of establishing electro-chemical and other key industries in India and it was recommended that where secret or very highly specialized processes of manufacture were involved the government should take steps to facilitate their introduction. As to the value of government subsidies doubt was expressed as to whether the great iron and steel works at Jamshedpur would have been in existence to-day on so vast a scale and have been so invaluable an asset in the war if government encouragement had been merely passive. Indirect assistance took the form of both railway construction and facilities, and of guaranty to take a minimum tonnage of the output coming up to a prescribed standard.

AMMONIA. The industrial use of pressure above a 1000 atmospheres in the production of synthetic ammonia, something never accomplished except by the Germans, was promised in a paper read before the Academy of Science in Paris by Prof. George Claude, who said that in the near future he would show a small installation plant capable of producing 200 litres of liquid ammonia daily. He said he was able to get 20 times as much ammonia from the same amount of primary matter as was produced by the German chemist, Haber, by the latter's method. From Italy came the information in April that an American had secured from the Italian government a concession for the utilization of 800 horse power of the waterfalls at Terni, about 70 miles from Rome, and who maintained that he could turn out nitrogenous plant food for the Italian farmer at a cost as low as 1 lira a kilo. The process does not require coal or any other

material except air and water. It is extremely simple and works automatically without expense for attention, energy, or material. It forces a mixture of nitrogen and hydrogen through catalyzing tubes at a pressure of 250 atmospheres, resulting in the transformation of the two gases into pure ammonia. The special and secret feature of the process is the discovery of a catalyzer which produces the remarkable results described. The ammonia produced is condensed into liquid form by a refrigerating apparatus and drawn off in steel cylinders. It is put on the market in these cylinders at prices which are said to be 100 per cent above the cost of production. The whole apparatus, aside from the cells for producing the hydrogen, easily can be made to occupy a space of about 625 square feet. A syndicate was formed in London, England, with a capital of £5,000,000 to establish a nitrogen factory for the manufacture of ammonia synthetically, from the nitrogen of the air. A site was purchased in Durham which the British government acquired for the purpose of building a factory. The process to be used will be that of the German chemist Haber. Nitrogen and hydrogen will be combined into ammonia, under pressure at a high temperature, the ammonia then being converted into nitric acid, or other nitrates, as may be required either for the manufacture of explosives or for use as fertilizers.

FUEL. Peat continues to be the most available substitute for coal. This may be shown from an account of the Irish peat industry in which it is said that at least 1,500,000 of Irish people depend for their fuel supply on peat alone, the annual consumption amounting to about 7,000,000 tons, equivalent to 3,500,000 tons of coal. Also there are about 4,750,000 tons of coal used each year, of which 90,000 tons represents the average annual output of Irish mines. With regard to the winning of peat in Ireland, it may be true that formerly peat could, on the small scale, be won more cheaply by hand than with machinery, because the proper methods had not been developed and cheap labor was available, but with the recent improvements in mechanical excavating and handling apparatus this is no longer so. The output of peat won by hand for each person is 130 tons a year; where mechanical means are availed of, this figure is increased to 230 tons. As the latter figure is only the calorific equivalent of 115 tons of coal, and as the output for each operative employed in the mines is 130 tons in six months, the necessity of increasing the output of peat by the use of every mechanical device is obvious. Interesting trials to test the possibilities of peat as fuel for locomotives have been in progress on several railways in Sweden. The reports show favorable results. One railroad in Southern Sweden has found peat so practical for steam purposes that the management believes the road can dispense entirely with coal. The State Railways have likewise been testing peat for steam purposes, with good results, and have on a limited scale adopted it for fuel. For some years the State Railways have been operating a factory for the production of peat powder, which is said to make an excellent fuel. In Sweden, where there are 10,000,000 acres of peat bogs, with an average depth of 6.6 feet, the substitution of peat for coal would add enormously to the national wealth. Every acre of peat bog yields nearly 1000 tons of prepared peat. The reduced coal supply in Germany is causing the greatest

attention to be directed to any suggestion as to a possible improvement. The great turf moors and shale beds yet available for exploitation in Germany are a source of much interest. A belt of shale is traceable in the southern parts of Hanover, through Brunswick, and passing close to Darmstadt into Wurttemberg. A careful estimation places the possible production of shale at 13,000,000,000 tons, and that of combustible turf at 5,000,000,000 cubic meters. The great key to solving the problems of heating from these sources would be a system of gas manufacture. In Italy, lignite is finding increasing demand. In 1908 the production of this fuel was 480,029 tons as compared with 2,216,583 tons in 1918. Before the war the amount of lignite existing in the subsoil of Italy was estimated at about 100,000,000 tons. Researches by the government mining corps, and by experts have shown that the amount of lignite in the deposits up to now explored may be estimated at about 270,000,000 tons. A new Australian syndicate has been registered in Melbourne to mine, process, and deliver to prospective customers throughout the commonwealth pulverized lignite, or brown coal, which, it is claimed, can be used for steam generation or metallurgical purposes with most satisfactory results. The syndicate controls various brown-coal deposits throughout Victoria, said to contain over 250,000,000 tons, and mining operations are under way. The most striking improvement in the new method of treating lignite, known as the "Buell system," is the means of air-drying at the mines, whereby the moisture content is reduced from 50 to 25 per cent in seven days. After the lignite is mined, the coal is crushed to egg size and then hoisted to the air-drying tipples at the surface by bucket conveyors. After drying about seven days, the coal is relieved of practically half of its moisture content and is ready for final treatment which consists of again crushing the coal (to about $\frac{1}{2}$ -inch mesh), after which it is passed through a rotary drier, where the moisture content is reduced to about 10 per cent. The fuel is then pulverized, separated by air, and stored in bunkers. For use, it is blown through pipes, where it is mixed with air containing 10 per cent in excess of requirements and ignited at the tip of an adjustable burner, which enables the length and width of the flame zone to be accurately gauged. Boiler tubes and baffles are kept clear of ash by soot blowers, and suction conveyors carry off the ash to any desired place of disposal. Three per cent of the power generated is required to operate the plant, and one experienced man can fire a whole battery of boilers or kilns. Shale is now being employed in Esthonia for all manner of purposes; thus the gas factory in Reval is using it exclusively for producing gas. It cannot be burnt as fuel in fire boxes, not as they are constructed at present, because of the large quantity of ash, and the factory, therefore is using wood as a fuel. The quantity of gas obtainable from the shale is greater than from coal. The Reval factory has obtained up to the present 120,000 poods of shale. The Port-Kunda cement factory has recently purchased 60,000 poods from the Ministry of Trade and Commerce and has a similar amount ordered. It is intended to employ shale mixed with 50 per cent of coal dust in the manufacture of cement. Experiments in firing locomotives with shale have given very satisfactory results, and the railway shop in Reval is

now reconstructing the fire box on an engine with the intention of employing shale as fuel. During an excursion to the island of Naissaar, undertaken by a commission in order to acquaint themselves with the local conditions, shale was employed exclusively as fuel in place of coal. The experiment turned out quite satisfactorily, a head of steam being obtained equal to that when coal is employed. The difference in cost is remarkable, the price of coal at present being 30 marks a pood and that of shale only 3 marks, so that even if the consumption be more than double, a great saving would be effected. The engineers are of the opinion that when the boxes are made suitable for the employment of shale, it will be much cheaper to use this fuel than coal.

It is reported that war-time experiments in Germany showed that the distillation of lignite at high temperature gave a liquid coal tar which contained certain ingredients suitable as a substitute for gasoline, kerosene, and lubricating oils. Through a new process benzine and kerosene can be obtained from liquid coal tar, which has been distilled from lignite at a lower temperature, and all industries using lignite are urged to set up facilities for generating this liquid coal tar and thus secure synthetic products to supply the lack of the natural products. Colloidal fuel, a composite of pulverized coal and oil, giving ships a wider cruising radius with increased boiler efficiency, was invented by Lindon W. Bates. It has equal or superior steam-making power to the unit of volume compared with standard navy oil fuel and saves from 25 to 35 per cent of expensive oil fuel by incorporating coal into a treated composite where it will remain in a state of suspension. Colloidal fuel requires no different equipment from that now in use on oil-burning ships. It may be made with the smaller sizes of coals too fine to be fired on grates. Thus earth crushed anthracite and washings from rivers may be utilized. It is the most compact fuel known. While oil contains about 148,000 British thermal units a gallon, an average grade of colloidal fuel, made with bituminous coals, contains 160,000 thermal units and grades may be made containing over 180,000 thermal units. In regard to cost, colloidal fuel can compete with straight oil when the cost of oil is over 2 cents a gallon and coal at its usual price. Another invention of this character recently introduced into the United States consists in the introduction of sulfite coal as a by-product from the manufacture of wood pulp. A ton of wood pulp yields 9 to 10 cubic meters of sulfite lye, of which 95 per cent is available for the production of coal, compared with about 60 per cent from other processes. It is estimated that it is possible to produce annually sulfite coal equivalent to 800,000 tons of imported coal. Considerable quantities of cheap alcohol are produced from the wood pulp lye before it is made into coal. An essential feature of the new process is high concentration of the lye before removal from the autoclaves. By concentrating it to 30 per cent, not only is a high percentage of coal-producing substance obtained, but the quantity of solid matter is increased by 50 and even 70 per cent.

MOTOR FUELS. In September it was announced that a gas possessing explosive qualities sufficient to drive an automobile and which might also be used for illuminating was being produced at the Arlington experimental farm of the Department of Agriculture from the distillation of

ordinary field straw. The tests with various straws were continued and efforts made to work out a model plant for the distillation of the gas. Fifty pounds of straw will produce about 300 cubic feet of gas, and the problem of liquefying or condensing the gas in order to enable it to be used practically as a motor fuel is now in process of solution. If a suitable unit can be constructed so that the farmers' initial cost will be small, it seems likely that straw gas may have a certain economic value in sections of the country where the raw material is considered as waste and is burned or left to rot on the fields. The high prices and increasing demand for gasoline have led to experiments in England for a suitable substitute motor fuel, and the British government is conducting wide researches to discover a liquid fuel that will combine satisfactory features from both a scientific and a practical viewpoint. Omnibuses were successfully run in Paris on a mixture of benzol and alcohol. Benzol being a coal-tar product resulting from fractional distillation and usually extracted or "washed" from coal or household gas, the supplies of benzol are dependent on the supplies of bituminous coal and habitually contingent on the good will of the gas companies. The alcohol used was extracted from vegetable matter, and consequently there is no limit to the available supply. The experiments have contemplated a liquid fuel containing as large a proportion of alcohol as possible. Nevertheless, it appears that neither benzol nor alcohol burns so quickly as gasoline, and the use of a mixture will necessitate the structural modification of the ordinary gasoline engine. It is reported by the London Automobile Association that natalite (See YEAR BOOK for 1918, p. 128) a new motor fuel, is well spoken of, and has had many favorable reports upon its practicability as a gasoline substitute. It is a by-product of the Natal sugar industry, and is reported to be a mixture of power alcohol and ether, capable of great development, in view of the large tracts of waste vegetation available in South Africa. In addition to natalite, which is made in Natal from the refuse of the sugar-cane mills and used as a motor fuel in South Africa, there has recently been produced another motor fuel to meet the shortage and high cost of gasoline in that country. The basis of this new fuel, which is called "acetol," is alcohol and ether, which comprises 90 per cent. The other ingredients are secret. It is said that this fuel apparently solves the question of the air-cooled engine. No carbon sediment is formed in the cylinder, and the fuel is claimed to be a non-injurious to the carburetor and engine. No special carburetor is required. Acetol mixes with gasoline. The inventor claims that it has a wider explosive range than the ordinary marketed gasoline, that is, both a weaker and an over-rich charge in the cylinder heads will fire when gasoline fritters out or chokes. It is said that acetol can be manufactured much more cheaply than the present cost of gasoline in South Africa. There is a movement in Australia to endeavor to replace petrol, which is used for internal-combustion engines, by industrial alcohol, attention having been called to the fact that in Natal a patent spirit called natalite is being marketed at a price much below that at which petrol can be sold. There are, it is claimed, opportunities for utilizing vegetable products in that country from which alcohol can be distilled, producing an industrial spirit at

prices much below those at which petrol is now being sold. Provided works are established near, it will be found a profitable enterprise for farmers to grow certain crops, which can be designated, for the production of industrial spirit.

ALCOHOL. The extraction of alcohol from coke-oven gas on a commercial scale was proved possible at a meeting of the Cleveland Institute of Engineers at Middlesbrough, England, by Ernest Bury, who showed that he had succeeded in extracting ethyl alcohol and its derivatives. The practical working of Mr. Bury's process at the Skinningrove plant, where 5800 tons of coal are carbonized a week, revealed an average yield of 1.6 gallons of alcohol to the ton of coal carbonized.

DYESTUFFS. The coal tar color industry has become so firmly established in the United States that it would require a special article to describe its development. That this is a fact is shown by a statement in the autumn by the Bureau of Foreign and Domestic Commerce that the exports of aniline dyes amounting to \$10,183,948 in the fiscal year 1919, has been increased to \$17,130,397 in 1920, a gain of 68 per cent. With the return to peace it is evident that whatever the demand for dyes made in Germany may be, that country will never regain its lost supremacy in the world trade in dyestuffs. The United States was first to establish a domestic industry sufficient to meet the demands of the home market. This was done on private initiative and capital. The British government has established a definite policy, backing it financially, to develop this industry and maintain it so that England will not again be dependent on outside sources for its colors and dyes. Although the British production is constantly increasing, it has not been able to overtake the increasing demand. A recent estimate gives the total output as equal to about 80 per cent of the dyes actually consumed in the United Kingdom. France, Italy, and Japan are producing some dyestuffs, but due to lack of raw materials and to other difficulties incident to establishing the manufacture, these countries can not yet supply their own textile factories with the quantity and variety of colors needed. Germany, it is now conceded, will not be the strenuous competitor she was formerly in the foreign trade. Switzerland is the only country, other than the United States, now making aniline colors sufficient to meet its own requirements and to export on a large scale, and the Swiss are dependent on other countries for the raw materials. The condition of indigo is of interest. Imports of natural indigo declined from 996,069 pounds, worth \$1,242,885 in 1919, to 126,539 pounds, valued at \$165,332 in 1920; but the imports of synthetic indigo increased from 594,107 pounds, invoiced at \$308,582 in 1919, to 1,014,100 pounds, valued at \$530,285 a year later. This was expected, as synthetic indigo is superior commercially to the vegetable product, the color being more even, and the cost of production prior to the war less than that of the natural indigo. As the bulk of the synthetic product was made in Germany, when imports were cut off by the war, the trade in the natural product revived, but will not be able to hold its place under peace conditions in competition with the synthetic indigo, more especially as the latter is now being produced on a commercial scale in the United States. It is announced that after experimenting for two years the British Dyestuffs Corpora-

tion has discovered at its Huddersfield laboratories the secret of manufacturing alizarin cyanine green on a commercial scale; which dye was discovered in 1894 and was made exclusively by Germany before the war. Its special characteristic is that when applied upon wool, chromed or unchromed, fine green shades are produced which remain fast.

PAPER. The output of the paper-making industry throughout the world continues below the requirements for the numerous purposes to which paper is at present applied, due to the great scarcity of paper-making raw materials. In Great Britain the sources of supply have been from Sweden and Norway, but in these countries there is a short supply of wood pulp and the high cost of labor in forests and in pulp factories has greatly increased the price of pulp. The United States gets its paper largely from Canada, but there is not enough to supply the demand. In Germany manufacturers have been forced to increase the price of paper to an amount where the demand is seriously affected. Straw is now being largely used in that country as a source of paper. From India it is reported that grasses have been studied in the Forest Research Institute, but certain practical difficulties persist so that while these grasses promise a large source of supply for the future, they cannot at present be recommended as a practical proposition. Eventually the difficulties will be overcome, but at present the field for a new source of supply is held by bamboo. It can now be said that there remain no practical difficulties in transforming bamboo into pulp; and that there is the promise of a large supply under conditions which, compared with a material like wood, are permanent, for while wood takes from 30 to 50 years to grow, bamboo renews itself annually. Other sources that have been mentioned during the year include papyrus, which grows in great abundance in the Belgian Congo, principally along the lower Luabala River. It is planned to establish near the river a large plant which will have an initial production of 20,000 tons of pulp. In Spain, paper makers are turning their attention more and more to esparto to supplement the import supply. From England there is information that a new process for making paper out of peat pulp has been invented by A. L. Burlin, who announced at the Manchester College of Technology that the various kinds of paper he has produced by his process, which depends upon freshly cut peat containing 75 per cent of moisture, consist of colored packing paper, sugar bags, wall papers, bookbinders' cloth paper, artificial leather, cream and white paper. Plans for the establishment of a large paper mill in Southern Saskatchewan to utilize the vast quantities of waste straw in the province are reported. A new process of making paper has been discovered by a German inventor who uses the rank grass that grows in swamps. He claims to have made the best quality of craft paper from the leaves and stalks of these plants, and the highest grade of art paper from the roots, from which sugar and alcohol also are obtained. The company holding the patents have received a contract from Roumania to clear the river banks and beds of swamp grass. For this it is being paid by that government and it will use the grass thus obtained for the manufacture of paper.

DIAMONDS. It is reported from Germany that the firm of Alfred Nobel, formerly makers of

dynamite and other high explosives, are manufacturing synthetic diamonds. No details are available as to the nature of the process, though it is believed to differ considerably from those previously known. Not only have many diamonds of good size been produced but it is claimed also that the cost is such that it will be possible to make them profitable. In quality the artificial stones are said to be equal to any which come from mines. An important discovery of diamonds comes from the Gold Coast of Africa, somewhere on the eastern side of the Abomo Su on the road from Asumafa to Abomoso. The diamonds were found in panning gold and concerning their origin it is said that the general character of the diamondiferous gravel and the concentrates therefrom suggests their derivation from a granite-pegmatite area, but much of the quartz and the gold are undoubtedly of local origin. Much more work needs to be done before the origin and full distribution of the diamonds can be proved, while their economic value can be ascertained only after inspection by diamond appraisers.

ARTIFICIAL SILK. The scarcity and high prices of silk and other textiles are the cause of a renewed impetus that has been taken in the fabrication of the chemically produced textile material known as artificial silk. There are five kinds of artificial silk: nitrated silks, collodion silks, viscose silks, acetate silks, and gelatine silks. At Lyons, France, a renewed interest was given to the use of chemical textiles by the invention of a new process, the product of which is called silk cellulose. This form of cloth is claimed to possess a brilliancy comparable to silk, a remarkable solidity and durability, a touch similar to silk, and absolute imperviousness to water; at the same time it is no more endangered by fire than the ordinary natural silks. While the thread of the viscose silks is relatively coarse and thick, the new silk permits making threads of considerable fineness and is particularly remarkable for the quality of velvets that can be made from it. The new process differs radically from the old processes. Instead of converting a thick liquid (the viscose) into thread, it appears that it is possible to preserve the wood fibres and convert them into a brilliant and solid cellulose. As a result of this there is obtained a greater molecular concentration and a regular geometric form in the elements that make up the thread; all of which greatly increases the strength and durability of the cloth. The Dupont Company and the Comptoir des Textiles Artificiels of Paris have entered into an agreement for the formation of a new company for the manufacture of artificial silk, it was announced in April, to be known as the Dupont Fibre Silk Company. The manufacture of artificial silk is being undertaken in Spondon, near Derby, England. Samples of silk thread produced there have been submitted to weavers, who say that it is of such texture and quality that when converted into articles of clothing they will have the appearance and finish of natural silk. When fully developed this factory will produce nine tons of artificial silk a day. Other products which the company is manufacturing, or intends to manufacture, include non-inflammable films, synthetic perfumes, and aspirin. Announcement has just been made that an Italian company will soon begin the construction of new plants for the manufacture of artificial silk. These plants will

probably be located at Turin, Naples, Orbasano, and Bra. In the first two instances sites have already been purchased, and it is expected that they will give employment to 10,000 workers. The artificial silk factory at Tomaszow, Poland, was founded before the war and manufactured silk with the aid of collodion, the fundamental raw materials of which are cotton, ethylic alcohol, ethylic ether, and sulphurous and nitric acid. Great obstacles have been met with in the re-starting of the factory, on account of the lack of raw materials in the home market. The pre-war output amounted to 1500 kilos of silk daily and was steadily increasing. The factory will employ upward of 1000 hands and will bring a considerable amount of foreign money into the country, as large quantities of silk will be exported. It is proposed to start with an output of about 500 kilos a day.

EXTRACTING WOOL GREASE. A plant has been established in Melbourne, Australia, for exploiting a new process of extracting grease, the base of lanoline, from wool, and for the manufacture of special neutral wool-scouring and other soaps. In the new process no sulphuric or other acid is used, and the product is wholly animal and pure. The process has been tested sufficiently to prove that by it lanoline can be produced in commercial quantities at a very low cost.

RUBBER. It is reported that the discovery of a new process of vulcanizing rubber has been made in the Manchester, England, College of Technology. The importance of the discovery is in the fact that it is a method of cold vulcanizing. It makes use of two gases, hydrogen disulphide and sulphur dioxide, which react on each other to produce water and free sulphur. It is found that when crude rubber, either in a solid form or in solution, is treated with these two gases the sulphur produced by their interaction vulcanizes the rubber.

SUGAR. The failure of the Central Europe crops of beet sugar owing to the world war, naturally led to efforts for its cultivation elsewhere, and early in the year the movement toward the production of beet sugar in Great Britain assumed more definite shape. A corporation was formed with a capital of £1,000,000, of which half was issued. The British government took a small block of stock and guaranteed a dividend of 5 per cent for 10 years upon private capital invested, and will receive no interest on its own investment until a 5 per cent cumulative dividend upon such capital has been realized. The factory will be at Kelham, near Newark, where a site has been secured. With the government support as above mentioned, there is no reason why the enterprise should not prove a success. That the production of sugar from the sap of the nipa palm, a tropical plant growing over extensive areas, is commercially possible, was developed by laboratory experiments conducted at the Bureau of Science, Manila. The industry is in an experimental stage in the Philippines, but from the experiments made it is estimated that there would be at least 12 per cent of recoverable sugar in the sap, and the average annual yield of 4000 gallons of sap an acre under management should produce about 4000 pounds of sugar. Nicolas Kopeloff and Mrs. Lillian Kopeloff, bacteriologist and assistant bacteriologist at the Louisiana Sugar Experiment Station in New Orleans, by making bacteriological examinations at every stage of the sugar-making

process, have found that sugar deterioration can be prevented by substituting dry or superheated steam for water in the final process of washing sugar in the drums in which sugar is dried. These centrifugals in their whirling suck up air from the floor which may be contaminated with germs. It is also common practice to make the color of the sugar lighter by washing the crystals with water, which may be contaminated with molds and bacteria. It is found that dry steam is successful in killing over 99 per cent of these avid molds and bacteria. While the practice of steaming sugars is not a new one, the results are shown to have a direct practical value in eliminating losses. Fully 1 per cent of the Cuban crop, or about 70,000,000 pounds of sugar a year, and worth at least \$1,600,000, it is estimated, has been destroyed by the tiny organisms which may be eliminated by the proposed method and the product saved.

MALT SUGAR SYRUP. While malt sugar has been known to chemists its production on a commercial scale is now beginning. The shortage of sugar has developed a market for it and the prohibition law has made available both the raw material and the machinery needed for its manufacture. Malt sugar syrup is made from the same grains as beer, and may be made from corn or potatoes or any plant containing starch. Barley, which was used until recently in the manufacture of beer, can be used now to produce malt sugar syrup. Up to a certain point the process of making malt sugar syrup is the same as the process for making beer. Evaporating pans are the principal additional equipment required by brewers. The product looks like maple syrup. It can be used for everything that cane sugar is used for. While its use may be not quite as convenient as sugar, it is a most excellent substitute for table use when sugar is not to be had, as it not only provides sweetness but is equal to sugar in food value. For cooking and baking and for making candy it is not only equal to sugar in convenience and food value, but is superior for some uses because it will not crystallize so readily.

FURFURAL. A substance obtained from corn cobs that can be made into a great many dyes, several paints, lacquers and other useful commodities, is the result of experiments made by the Bureau of Chemistry of the United States Department of Agriculture to discover the best methods for the utilization of corn cobs. Furfural has been a comparatively rare product, and was sold chiefly in small quantities for scientific purposes. Specialists of the Bureau of Chemistry say that it can be manufactured from corn cobs at a cost of perhaps 15 or 20 cents a pound. The previous scarcity and high price have prevented commercial use of furfural to any considerable extent. Its most important known use is, as an intermediate for dyes. A whole series of dyes may be prepared by interaction with various coal-tar products. Shades covering a very wide range have already been made and tested. A plant handling 100 tons of cobs a day would recover about a ton and a half of furfural as a by-product. A considerably larger quantity can be obtained from the corn adhesive by a comparatively simple process.

MANUFACTURE OF GLYCERIN. A war secret that has come to light is the following description of a German patent: The transformation of sugar into glycerin was accomplished by the

biochemical method. It had been known for a long time that in the ordinary fermentation of sugar with yeast small quantities of glycerin would be produced, amounting to about 3 per cent of the sugar. By adding alkalis to the liquid in fermentation the production of glycerin was increased. It was found that almost any salt with an alkaline reaction could be used for that purpose. Experiments were made with sodium acetate, bicarbonate, and dibasic phosphate, and with ammonium carbonate. The yield of glycerin was increased to 12.7 per cent, but the alkaline mash was found to be an excellent breeding place for all kinds of acid-forming bacteria which would pollute the glycerin. This was remedied by the use of sodium sulphite, which acts as a poison to the bacteria of lactic acid and others, but does not, even in large quantities affect yeast cells. When sodium sulphite was employed as an antiseptic the yield of glycerin was increased proportionately to as much as 23 to 36.7 per cent of the sugar.

A NEW SOLVENT. A new chemical reagent has been worked out in the chemical laboratories of the University of Wisconsin and its discovery announced by Victor Lenher. The new solvent is selenium oxychloride, and it is made of a commercial by-product which now goes to waste. As a chemical reagent this substance possesses the property of acting as a solvent for some of the most insoluble substances, as rubber, asphalt, and the bituminous material in soft coal. It is an excellent solvent for the unsaturated hydrocarbons, such as acetylene, benzene, toluene, etc., which dissolve readily in it, while paraffin hydrocarbons, such as gasoline, kerosene, and the mineral waxes, vaseline and paraffin, are unaffected. The vegetable oils are acted on, many with violence, and linseed oil forms a thick mucilaginous and rubber-like mass.

LITERATURE. The development of a greater interest in chemistry in Canada, the result unquestionably of the organization of the Canadian Institute of Chemistry in 1919, has further resulted in the publication of a *Canadian Chemical Journal* in Toronto.

CHESS. Jose R. Capablanca captured the world's chess championship in 1920 as the result of forfeiture on the part of Dr. Emanuel Lasker of Berlin after they had signed articles to meet at Havana, Cuba. Following this occurrence Capablanca went to Europe in an endeavor to get the famous master to change his mind, carrying with him the offer of a purse of \$20,000 subscribed by admirers of Capablanca. Negotiations were going along smoothly when suddenly Dr. Lasker made financial demands that it was impossible to meet.

In the United States the game received a new impetus through the visit of Samuel Rzeschewski, the Polish child prodigy, who gave several marvelous exhibitions of his skill, notably at West Point and later in New York City.

Frank J. Marshall won a masters' tournament held at Atlantic City, Charles Jaffe finishing second. The New York State title went to Jacob Bernstein. Columbia University carried off the laurels in a college competition with Harvard, Yale, and Princeton while in the Triangular College Chess League Cornell triumphed over the University of Pennsylvania, City College of New York, and New York University.

CHEVROLET, GASTON. Champion automobilist was killed at Los Angeles, Cal., November

25. His death occurred at the Los Angeles Speedway in the course of the 250-mile race for the 1920 championship, which he had won at the moment of the accident. He was born in France, Oct. 26, 1892, came to the United States in 1901, and worked in the automobile industry at Detroit, Mich., till the outbreak of the war, during which he was assigned to duty there. He entered the races as a mechanic in 1912 and won the second place in the 100-mile contest at Kalamazoo, Mich. He finished in nine races in 1915. At the Kansas City race of July 22, 1917, he broke his arm and did not race again until 1919, when he entered two races at Sheephead Bay, in New York.

CHICAGO, ILL. See CITY PLANNING; MUNICIPAL GOVERNMENT.

CHICAGO, UNIVERSITY OF. An institution of higher learning founded in 1891 at Chicago, Ill., largely through gifts by John D. Rockefeller, who has continued to aid the university. In the summer session of 1920 there were enrolled 2080 graduate students, 1402 undergraduates, and 2150 professional students, a net total of 5406. In the autumn of 1920, the enrollment was as follows: Graduate, 670; undergraduate, 2713; professional, 1620; university college, 1306; a net total of 5988. There were 377 members of the faculty. Productive funds of the institution amounted to \$28,364,303.51 and the income for the year was \$3,329,114.27. The library contains 599,492 volumes. President, Harry Pratt Judson, LL.D.

CHILD LABOR. During the war and also during 1919 child labor increased to a large extent owing to the scarcity of labor in carrying on the war, but after the war when employment was getting harder to find, it was expected that child labor would decrease. This has not proved true, although it has not increased in 1920. At the end of the year fewer permits were being issued for child labor and it was expected that during 1921 it would decrease materially. In its international aspect the problem was handled by the International Labor Office of the League of Nations at Geneva, Switzerland, and progress was reported from a number of countries that have passed laws restricting child labor. This has taken the form of compulsory attendance at schools up to age of 14 to 16, the restriction to an eight-hour day which affects both adults and children, and the prohibition of night work for workers under 14 to 18 years of age.

FIFTEENTH NATIONAL CONFERENCE ON CHILD LABOR. On April 15, 1920, the Fifteenth National Conference on Child Labor convened in New Orleans for the purpose of considering "The National Child Labor Committee at Work." The speakers told of the work of the committee and in most cases suggested further steps to be taken, and increased effort in certain directions. Mr. Wiley H. Swift in the course of an address said: "We began to study intently life in the back country, the rural child, and our discoveries have been astounding. The problem of child care in this country is not primarily a city problem. It is a rural problem. We are brought to a very deep realization of the fact that an intelligent handling of the question of the employment of children demands: (1) That the rural child be included. It is as much a crime to work a child to his hurt on a farm as in a mill. (2) That steps be taken to insure good health of children. It is a bad thing to have a sick child go to work

in a mill or a store. (3) That proper schools be provided and that children be placed in them. Ignorance is ignorance whether in the city or in the country. In either place it is a weight hanging to the feet of liberty. (4) That provision be made for the best care of all defective, neglected, dependent, and delinquent children." The other speakers more or less emphasized the same points. It seems that the realization of conditions of child labor in rural communities has just been reached, and that the principal effort of the committee will be extended in that direction during the coming year. The 16th annual report of the committee for the year ending Sept. 30, 1920, shows that its work during that period has had its principal success in Kentucky. The committee made an investigation of the child labor conditions in that State and then made a report to the Legislature which was acted upon favorably. See *State Legislation* below. Investigation of conditions in Tennessee was also carried on at the invitation of Governor Roberts, and report made. This report will be acted upon at the next session of the Legislature.

FEDERAL LEGISLATION. The Supreme Court has not yet handed down a decision on the constitutionality of the Federal Child Labor Taxing measure which it has under consideration. A previous law was declared unconstitutional in 1918. The new law contains substantially the same prohibitions, but enforcement is effected through the Federal Taxation Power. (For a summary of this law see YEAR BOOK for 1919.) It is entirely uncertain as to what the decision of the Supreme Court will be.

The President's Industrial Conference of December, 1919, and January, 1920, in its report, "urges upon all States not having adequate legislation upon child labor and compulsory education that they give these topics prompt and sympathetic consideration." Also, that "the fact that the former Federal child labor law has been declared unconstitutional should not be interpreted as registering or encouraging popular sentiment against such legislation, but rather as occasion for arousing public sentiment in the interests of the rights of childhood."

STATE LEGISLATION. The most important legislation of the year was in Kentucky where (1) The Governor appointed a Children's Code Commission as authorized by statute and the commission is now at work. (2) The total appropriation for the State health work was more than doubled, and a bureau established to promote county organization. (3) Resolutions were passed as a step toward amending the constitution in such a way that the offices of State Superintendent of Public Instruction and County School Superintendent can be taken out of party politics. (4) The child labor and compulsory education laws were improved in several important respects. (5) A Board of Charities and Correction was created. There had been none before. (6) A Domestic Relations Court for Louisville was created. In Alabama the appropriation for the Child Welfare Department was increased from \$12,500 to \$30,000. Louisiana passed a bill to provide for mothers' pensions. Massachusetts prohibited the operation, cleaning, or repair of freight elevators by children under 16 years. Mississippi made compulsory school attendance a State-wide measure, and increased the required school term from 60 to 80 days a year. New York created a children's code com-

mission to revise and standardize child labor laws of the State, and extended medical inspection provisions to include children employed in mercantile establishments. Virginia passed a measure providing for an eight-hour day for children under 16 years in canneries, factories, mercantile establishments, etc. Measures considered unfavorable to the child labor movement as lightening the restrictions on child labor were passed in Delaware, Maryland, and Virginia. Due to the fact that only 11 of the State Legislatures convened for regular sessions during 1920, State legislation on child labor has been comparatively small. A great many of the legislatures will be in session early in 1921 and a number of bills dealing with this matter will be presented at that time.

CONDITIONS OF CHILD LABOR IN THE UNITED STATES. Reports for the first six to eight months of 1920 from 27 States show the following statistics. A decrease in child labor is reported in Alabama, District of Columbia, Florida, Kentucky, Maine, Missouri, New Jersey, South Carolina, Washington, West Virginia, and Tennessee. Increases are reported in Connecticut, Illinois, Iowa, Kansas, Louisiana, Maryland, Minnesota, Nebraska, New Hampshire, New York, Pennsylvania, Texas, Wisconsin, Oklahoma, and Vermont. In Boston, the only Massachusetts figures now available, there was an increase of 14 per cent in the number of children going to work up to June. Since then there has been a decrease of 17 per cent over the same period last year. In five of the 10 States reporting a decrease a change in child labor or school laws is given as the reason for the decrease. Florida: enforcement of child labor law and the compulsory education law have resulted in decrease. Maine: new school law which went into effect July, 1919, has resulted in decrease, but the exceptionally small amount of child labor at present is partly due to the closing down of industries. Missouri: the new continuation school law together with enforcement of Federal law have resulted in the decrease. South Carolina: steady decrease since 1914 in cotton mills is due to State 14-year limit, and enforcement of Federal law. In 1914 there were 8380 children in South Carolina cotton mills alone, 3435 of them under 14. In 1920, according to the state factory inspectors, there were only 3721 children in the mills, none of them under 14. The total cotton mill population has increased by 13,000 since 1914. West Virginia: New child labor law is cause of decrease. In Alabama, the decrease is due to better law enforcement under the new Department of Child Welfare.

The causes of increase of child labor are so varied that they cannot be summarized although high wages, high prices, and poverty are probably the chief causes. High wages: In Chicago in one school district, 70 per cent of the children received an initial wage of \$10 a week or over, this summer. The average wage for the group was \$11.65 a week, which sum was an average adult wage ten years ago. High cost of living: In Louisiana "by far the larger number give as a reason the high cost of living. A few have admitted that they were going to work because of the higher pay they could get now, and in some instances during the recent strikes children gave as a reason for applying for work that their fathers were on strike." Demand for labor is given as a cause in Wisconsin, where there was a

20 per cent increase from January to September, 1920. Lack of enforcement of law: In Texas it is reported that the compulsory school law is not enforced.

There is every indication that the closing down of industries has caused a decrease in the number of permits issued in the last two or three months of 1920. But it is evident that in the larger industrial centres the increase of permits given out in the first part of the year was so great that it has not been offset by the present decrease. In New York City the total increase for the first six months was 5283; there was a decrease of 2930 in the next three months, making the total increase over last year 2353. In Chicago there was a 10.5 per cent increase for the first six months that is far from being offset by the decrease in the next three months. On the contrary, many industries are once again opening up after having been closed for a period. Although 1920 has been a year of low adult employment, it has been a year of increased child employment, probably due to the cheaper wages at which the children may be obtained. In New York City the Vocational Guidance and Employment Service for Juniors has been organized to cope with the problems resulting from unemployment, i.e., children going to work because of poverty in their families and children already at work being thrown out of employment. In Detroit the supervisor of compulsory attendance in the schools has asked the Public Welfare Commissions to provide scholarships for 1000 children now at work, so that they may be returned to school and their places in industry taken by the adults unemployed. The following figures give some idea of the extent of child labor in big industrial centres: Chicago: 27,806 children between 14 and 16 held work permits on July 1, 1920; New York City: 41,901 children, 14 to 16 secured permits during the first nine months of 1920 against 49,291 in the whole of 1919; Connecticut: average number of children securing work permits each year is 10,000; Massachusetts: 30,000 children 14 to 16 at work (estimated) and 80,000 under 18 years; Baltimore County, Maryland: 15,903 permits issued in the first ten months of 1920; New Jersey: average number of permits issued per year, for last four years, is over 19,000. The above figures do not cover unregulated industries, of course. Agriculture and domestic service are almost never regulated; street trades are seldom included as boys receive special permits for street work wherever there is any regulation.

FOREIGN. A royal order dated February, 1919, was made governing child labor in Belgium and possessions. This provides that children under 14 years may not be employed unless they possess a school-leaving certificate, and even then not under 13 years; that the employment of children under the age of 16 or girls under 21 on work designated as unhealthy, is prohibited; that children under 16 and girls under 21 shall not be employed for more than 12 hours in any one day, and that this period shall be interrupted by periods of rest every hour and a half; and that children under 16 shall not be employed after 9 P.M. or before 5 A.M.

A decree of December 19, 1918, in Czechoslovakia prohibits employment under 14 years, and further provides that male workers up to 16 years and female up to 18 years shall only be employed on work which is not injurious to their

health. A decree of March, 1919, in Austria further controls child labor in that country. The International Labor Office of the League of Nations at Geneva, Switzerland, is making efforts to have child labor legislation introduced into a number of countries which do not now have it. Legislation in England, following the recommendations of the joint industrial conference of employers and employees, is being enacted.

Further information on the subject of child labor may be had from the U. S. Department of Labor, Children's Bureau, Washington, D. C., and from the National Child Labor Committee, 150 E. 22nd St., New York City. The latter organization had in 1920 some 14,932 members, a marked increase from 1919. It publishes *The American Child*, a quarterly journal of general child welfare.

CHILD WELFARE. See CHILD LABOR.

CHILDREN'S COURTS. See JUVENILE COURTS.

CHILE. A South American republic on the western coast, extending along the Pacific to the south from Peru. Capital, Santiago.

AREA AND POPULATION. The length of the country from the Peruvian border to the southern limit of South America is 2628 miles and the average width from the crest of the Andes to the ocean is 177 miles. There are 23 provinces and one territory with an estimated total area of 289,829 square miles. The population in 1907 was 3,249,279. The population, Jan. 1, 1918, was estimated at 3,945,538, a density of 3.61 to the square mile. The populations of some of the principal towns in 1918 were: Santiago, 415,641; Valparaiso, 212,659; Concepcion, 72,785; Iquique, 46,941; Talca, 42,563; Chillan, 39,691; Antofagasta, 66,584. The great majority of the people are of European origin, only one-fourth being of pure Spanish stock. The Indians consist of three classes: The Changos, in the north coast region; the Araucans (about 101,000) on the western slopes of the Andes and in the valleys; and the Fuegians, who are mostly nomads, in the region around Tierra del Fuego. In 1919 the primary schools numbered 3174 with 7164 teachers and about 300,000 pupils.

TACNA AND ARICA. These two provinces have for many years been subject of dispute between Chile and Peru. They have been occupied by Chile since the treaty of 1884, but their possession was to be settled by popular vote in 1894. For various reasons this was not disposed of and the question was still unsettled in 1920. It was one of the points that required adjustment by the League of Nations, but its discussion was deferred when the subject came before the Geneva Assembly in December. The questions at issue and the arguments of the respective disputants will be found in the YEAR BOOK for 1918 under the title PERU. The region is shown on maps of Chile as the northernmost province of that country and on maps of Peru as the southernmost province of Peru. It comprises an upland tract rich in nitrate, but much of the land is infertile. In the eastern part there are valuable deposits of silver, copper, tin and other minerals. Railways connect points in the interior with the coast. Latterly the harbor of Arica has been improved and the nitrate industry has developed considerably.

PRODUCTION. The agricultural region is in the centre of the country and comprises about

42,184,000 acres, the number of farms in 1918 being nearly 100,000. The leading crops in respect to acreage in 1917-18 were in the order of their importance, wheat, wine, beans, barley, potatoes, oats, and corn. Their product in 1917-18 was as follows: Wine, 45,448,392 gallons; wheat, 12,584,606 cwt.; barley, 1,438,624 cwt.; beans, 1,386,288 cwt.; oats, 922,176 cwt.; corn, 734,472 cwt.; peas, 291,656 cwt.; potatoes, 236,122 tons. The livestock, Jan. 1, 1919, were as follows: Cattle, 2,225,323; sheep, 4,434,115; goats, 451,941; horses, 411,477; pigs, 326,337. (See AGRICULTURE.) By far the most important mineral product commercially is sodium nitrate to which Chile owes in large measure her prosperity. It is found chiefly in the desert of Atacama which is about 500 miles long and from 2000 to 6000 feet above the level of the sea. In 1918 the product amounted to 2,859,303 metric tons and the exports to 2,919,177 metric tons; in 1919, to 36,494,173 Spanish quintals. There are rich deposits of iron and copper. Other metals obtained are gold, silver, cobalt, and manganese, and among the non-metallic minerals, coal, salt, sulphur, and guano. The following figures for mineral products were published in 1920 by the Pan-American Union: The value of the mining output of Chile during the 10 years from 1909 to 1918, expressed in Chilean gold pesos, was as follows: 1909, 261,100,000; 1910, 300,400,000; 1911, 329,800,000; in 1912, 372,700,000; in 1913, 393,500,000; 1914, 353,700,000; 1915, 297,900,000; 1916, 491,300,000; 1917, 768,700,000; and in 1918, 772,200,000.

The Pan-American Union also published the following information in regard to factories: In 1918 there were in operation in the republic 7481 factories with an aggregate capital of 635,868,547 pesos, currency. During that year the combined output represented a value of 780,496,724 pesos, the raw material used, 409,604,937 pesos, the fuel consumed 19,594,911 pesos, and the number of employees 148,684. The production in 1918 was about 60,000,000 pesos more than in 1917, and the capital invested 23,585,215 pesos more. Of the material consumed in 1918, imported material entered to the amount of 124,074,978 pesos.

COMMERCE. The following figures were published in 1920 by the Chilean Bureau of Statistics: The total foreign trade for the year 1918 was 1,235,699,482 gold pesos, the imports being 436,074,065 pesos, and the exports being 799,625,417. In 1917 the imports were 355,077,027 pesos and the exports 712,289,028, or a total of 1,067,366,055 pesos. There was therefore for the year 1918, as compared with 1917, an increase in imports of 80,997,038 pesos and in exports of 87,336,389 pesos, or a total increase in the foreign trade of 168,333,427 pesos. The balance of trade in 1918 amounted to 363,551,352 pesos. In figures of United States currency, estimating the Chilean gold peso at 36.5 cents (18d sterling), the foreign trade for the year 1918 was: Imports, \$159,167,034; exports, \$291,863,277; total, \$451,030,311. On the same basis the figures for the year 1917 were: Imports, \$129,603,115; exports, \$259,985,495; total, \$389,588,610. The imports for the year 1918, by countries of origin, were as follows:

	1918
United States	\$74,259,940
United Kingdom	29,727,640
Peru	11,588,045
Argentina	11,806,836

India	6,828,620
France	5,087,814
Spain	4,420,889
Japan	4,293,245
Mexico	2,666,328
Australia	1,348,896
Bolivia	1,326,661
Italy	1,301,898
Sweden	1,178,265
Brazil	788,610
Ecuador	603,382
Cuba	566,450
Switzerland	374,546
Netherlands	256,456
Uruguay	217,830
Norway	212,376
Guatemala	172,151
Salvador	127,339
Costa Rica	130,183
China	110,262
Denmark	81,643
Panama	67,073
Portugal	36,198
Belgium	3,601
Germany	10,768
Other countries	133,589
Total	\$159,167,034

The exports for the year 1918, by countries of destination, were as follows:

	1918
United States	\$178,483,083
United Kingdom	66,475,572
Argentina	9,618,099
Peru	6,632,168
Japan	3,018,836
Bolivia	2,905,132
France	1,548,062
Panama	1,064,704
Egypt	962,411
Brazil	892,087
Polynesia	869,485
Spain	771,462
Australia	654,212
Mexico	609,096
Sweden	607,461
Java	551,180
Cuba	500,100
Italy	474,928
Ecuador	347,690
Uruguay	312,597
Cape Colony	175,606
India	124,626
Canada	86,954
Other British possessions	883,748
Other countries	396,616
Foreign merchandise exported	13,141,060
On orders	258,802
Total	\$291,863,277

In 1919 the foreign trade was as follows: Exports, 316,977,143 pesos; imports, 401,324,195 pesos.

FINANCE. The annual statement of the Minister of Finance of Chile, as published Sept. 13, 1920, showed that the budget prepared for 1921 reached 296,225,349 paper pesos and 55,654,835 gold pesos. (The paper peso fluctuates in value, averaging 10.75 cents on Oct. 21, 1920, while the gold peso is established at 36.5 cents.) This budget was estimated as sufficient to cover all expenses and leave a surplus of 74,000 paper pesos. The finances of the year 1919 showed a deficit of 20,000,000 gold pesos and 37,000,000 paper pesos. For the year 1920 the total authorized expenses, including pending appropriations, amounted to 337,472,120 paper pesos and 68,557,458 gold pesos, whereas the estimated receipts amounted to 146,144,603 paper pesos and 111,551,167 gold pesos. Taking into consideration laws pending, the deficit for 1920 would probably amount to 89,518,842 paper pesos.

COMMUNICATIONS. The railway mileage in 1918 was 5607 which consisted of the Longitudinal Railway running from north to south over a distance of 2831 miles and the Arica to La Paz

railway (271 miles), and 2445 miles of privately owned railways. The post offices in 1918 numbered 948 and the telegraph lines had a mileage of 21,213, of which about three-fourths were owned by the government. The merchant marine in 1918 consisted of 95 steamships and 35 sailing vessels, and the vessels entered had a tonnage of 12,514,594 and those cleared had a tonnage of 12,625,686.

DEFENSE. Compulsory military service lasts from the 18th to the 45th year inclusive. At the age of 20, recruits are trained for one year and they then serve for nine years in the reserve of the active army. After that, until the end of their 45th year they are in the second reserve which serves as the second line army. The total strength of the Chilean army in 1919 was 1374 officers and 19,487 men. In December, 1918, the organization of an air force was begun under British instruction, a number of seaplanes and airplanes having been purchased from the British government. The principal vessels of the Chilean fleet are the *Capitan Prat*, a pre-dreadnought, and the *Esmeralda* and the *O'Higgins*, both of which are armored cruisers. The first-named has a displacement of 6966 and the other two of 7030 and 8500 respectively. There are besides a number of torpedo-boats, destroyers and other small craft. See NAVAL PROGRESS.

GOVERNMENT. The executive authority is vested in a president elected for five years by indirect vote and not eligible for reelection. The legislative power is vested in a congress consisting of the Senate and the Chamber of Deputies. The Senate has 37 members, elected by provinces for six years and the Chamber 118 members, elected by departments for three years. There is a state council consisting of five members nominated by the President and appointed by Congress, and there is a Cabinet or Ministry divided into the following departments: Interior; Foreign Affairs; Justice and Public Instruction; Finance; Defense; Industry; Public Works and Railways. The President in 1920 was Señor Dr. Juan Luis Sanfuentes, who assumed office, Dec. 23, 1915. On June 25, 1920, a new presidential election was held, but its results were disputed and a Court of Honor was created to decide the question in October. The Court decided that the majority of electoral votes had been given to Arturo Alessandri, the head of the Liberal and Radical coalition.

HISTORY

PRESIDENTIAL ELECTIONS. The candidate of the Liberal Alliance, Arturo Alessandri, who was nominated April 25th, at a meeting of the Radical, Democratic, and a part of the Liberal parties, secured as a result of the popular vote, 177 electors, against 174 for Luis Barros-Borja. According to law a joint session of the Congress should pass upon the election a month after its correction, but the Congress delayed its decision and a Court of Honor was constituted to review the returns. Two members of that tribunal resigned and there was doubt whether the decision of the Congress would not have to be awaited, but on October 4th, the Court of Honor rendered its decision which gave Alessandri a majority of one electoral vote. Congress accepted the decision of the Court and proclaimed Alessandri the duly elected President for the five year period beginning December 26th. The new President was a representative of the middle class and was reputed to have great popularity

among the people at large. He had been in the course of his career a representative in Congress and several times member and once chief of the cabinet. He was committed to the acceptance of a variety of reform measures, including decentralization of the administration; allowing the provinces to elect their own officers; stabilizing exchange; woman suffrage, subject to certain qualifications; a proportional tax on incomes; extension of the protection of labor. As to the long-standing dispute with Peru, he declared that his efforts would tend to put an end to the old question within the bases on which both countries signed the treaty of Ancon, carrying out the plebiscite established therein in accordance with the precedents that international law fixed for these acts. Both countries, he said, had an interest in solving the question.

MINISTERIAL PROGRAMME. The new Ministry presented its programme to Congress, December 28. It included certain proposals for the restriction of the production, importation, and sale of alcoholic beverages. The measures were so far as possible to avoid injuring the capital invested, and they looked to a more or less exclusive production of wine, instead of stronger liquors. The programme also referred to the desirability of woman suffrage, and the equality of women under law in administration, trade, and industry. Other features dealt with economic conditions including the necessity of greater production and of a higher degree of coöperation between capital and labor with a view to reducing the cost of living; a minimum wage scale; the arbitration of labor disputes; the creation of a ministry of labor and social welfare and of a ministry of agriculture; the passage of laws stabilizing the market; and the increase of the state revenue by 100,000,000 pesos to meet increasing expenses; the revision of the tariff schedules; a tax on private wealth and increased taxes on inheritances; and on imported tobaccos and liquors.

OTHER EVENTS. The Swedish Council of State approved a convention for arbitration of any future differences with Chile, providing that disputes should be submitted to the Council of the League of Nations. In November plans were announced for fortnightly sailings of the vessels of a Swedish shipping company between Sweden and Chile. An extraordinary earthquake occurred December 9th, in the course of which mountains in the Andes sank for a distance of about 160 feet. It was accompanied by the eruption of two volcanoes. There were not many casualties, owing to the fact that the region was thinly populated. It occurred in the neighborhood of the lower Franeura River, latitude 39.20, longitude, 71.41.

CHINA. Down to Feb. 12, 1912, the oldest monarchy in the world; on that date declared a republic; situated in the far east of Asia on the Pacific Ocean. Capital, Peking.

AREA AND POPULATION. China proper contains 18 provinces. The territory of the republic also includes the so-called new dominion of Sinkiang or Hsinchiang; Manchuria, Mongolia, and Tibet, but over Tibet and Inner Mongolia only a loose authority is exercised, while Outer Mongolia was recognized as self-governing in October, 1912. See the YEAR BOOK of 1917 for a summary of changes after 1897. The estimates of population vary all the way from the neigh-

borhood of 300,000,000 to over 430,000,000. The former American Minister at Peking estimated the total population, exclusive of Tibet and Mongolia at 325,000,000. The Chinese Maritime Customs estimates it at the high figure of 439,405,000, including Mongolia and Tibet, but excluding Manchuria which was placed at 19,290,000. The area including all the divisions above named was estimated at 3,913,560 square miles. No later figures by provinces and other divisions are available than those published in preceding YEAR BOOKS which are repeated here for convenience. They date back to Feb. 27, 1911.

The 18 provinces of China Proper	Area: English sq. miles	Population (estimated)	Capital (Seat of Tutukh)
Chili	115,800	22,970,000	Tientsin
Shantung	55,970	25,810,000	Ch'i-nan
Shansi	81,880	9,420,000	T'ai-yuan
Honan	67,940	22,875,000	K'ai-feng
Kiangsu	38,600	15,380,000	Nanking
Anhui	54,810	14,075,000	Anch'ing
Kiangsi	69,480	16,255,000	Nanch'ang
Chékiang	36,670	13,950,000	Hangchow
Fukien	46,320	8,560,000	Foochow
Hupei	71,410	21,260,000	Wuchang
Hunan	83,880	20,580,000	Ch'angsha
Shensi	75,270	6,725,000	Hsian
Kansu	125,450	3,810,000	Lanchow
Szechwan	218,480	54,500,000	Ch'engtu
Kwangtung	99,970	23,700,000	Canton
Kwangsi	77,300	5,425,000	Kuei-lin
Kweichow	67,160	9,265,000	Kuei-yang
Yunnan	146,680	8,053,000	Yunnan
Total	1,532,420	302,110,000	
New Dominion: Hsinchiang	550,340	2,000,000	Tihuaifu (Urumchi)
Dependencies: Manchuria	863,610	
Fengtien	5,830,000	Mukden
Kirin	5,350,000	Kirin
Heilungchiang	1,560,000	Taishihar
		12,740,000	
Mongolia	1,367,600	1,800,000	Urga *

Grand total	3,913,560	320,650,000	

* The seat of the Bogdo Khan. † The seat of the Dalai Lama.

Peking, the capital, has an estimated population of over 1,000,000. The principal ports with their populations estimated for 1918 are as follows:

Aigun	18,546	Soochow	500,000
Sansing	15,465	Hangchow	684,137
Harbin	28,600	Ninpo	670,000
Antung	51,834	Wenchow	212,699
Dairen	54,715	Santiao	8,000
Newchwang	58,061	Foochow	624,000
Chinwangtao	5,000	Amoy	114,000
Tientsin	800,000	Swatow	85,000
Chefoo	54,450	Canton	900,000
Tsingtau	50,175	Kongmoon	70,000
Chungking	437,600	Samshui	8,000
Wanhien	70,000	Kiungchow	58,527
Changsha	535,800	Pakhoi	20,000
Ichang	55,000	Wuchow	40,000
Shasi	105,000	Nanning	50,000
Hankow	1,443,950	Lungchow	13,000
Kiukiang	36,000	Mengtsz	10,000
Wuhu	99,584	Szema	15,000
Nanking	376,291	Tengyueh	10,000
Chinkiang	168,309	Shanghai	1,000,000

The following information concerning the foreign population of China was supplied by the Bureau of Foreign and Domestic Commerce in December, 1920. The following table indicates, by nationalities, the foreign population and business firms resident in China in 1913, 1918, and 1919:

Nationality	1913	Persons		1913	Firms	
		1918	1919		1918	1919
American	5,340	5,766	6,660	131	234	314
Austrian	419	271	27	22	16	5
Belgian	178	360	391	18	20	20
Brazilian		16			1	
British	8,966	7,958	13,234	590	606	644
Danish	854	475	546	14	23	27

The figures for the American population are defective owing to the omission of American residents to register at the various consulates. These had increased much more than the figures indicate. The British population increased from 8966 in 1913 to 13,234 in 1919, and this undoubtedly was a true reflection of the actual British residents in China. The increase in the Japanese and Russian population was expected and was not thought to be overestimated.

The increase in American firms from 131 to 314 was more nearly correct than the statistics in regard to the population. See ANTHROPOLOGY.

RELIGION AND EDUCATION. Ancestor worship prevails throughout. There are three forms of native religion: Confucianism, Taoism, and Buddhism. Mohammedans are found in all the provinces and are the most numerous in Kansu, Sinkiang, Chili, and Yunnan. Their number was estimated in 1909 at from 5,000,000 to 10,000,000. The majority of the people are Buddhists. At the end of 1916 the Roman Catholic natives numbered 1,790,220; Protestants, 511,142; Orthodox Greek, at the end of 1915, 5587. Under the new republic provision was made for compulsory primary education, and for the establishment of various technical colleges and higher normal schools. These measures were in 1920 partially executed, but had been arrested by the disturbed conditions of the country and by financial difficulties. The schools of all kinds in China were estimated in 1916 at 129,739 with 4,294,251 pupils.

PRODUCTION. The interests of the country are chiefly agricultural and the holdings are for the most part small. Cultivation is in a backward state and primitive tools are used. The method is rather intensive than extensive. The leading crops are wheat, barley, corn, millet, and other cereals; peas and beans, rice, sugar, indigo, cotton, tea, and silk. Of the live stock, pigs are raised in especially large numbers and are an important export. There is an abundant growth and great variety of fruit trees, and the raising of vegetables has been carried to a high degree of perfection. The chief area of cotton production is the Yangtse Valley. Tea is cultivated in the West and South. The soya bean is the chief product of Manchuria. One of the most successful industries is the culture of silk, China supplying about 25 per cent of the world's stock of raw silk. In 1918 an international committee was established for the promotion of silk culture with a promise of government aid and since that time the scientific study of the subject has been carried on in schools opened for the purpose. A number of cotton, wool, flour, and rice mills have

latterly been established. As to mineral resources, China is considered one of the chief coal countries of the world, the coal area being placed at 133,513 with an average annual production estimated at 15,000,000 tons. Iron also is abundant, the average annual production being about 468,638 tons and the Taysh deposits being classed among the richest in the world. Petroleum is worked on the Upper Yangtse and in the Province of Chensi. The copper resources of Yunnan are reputed to be among the richest in the world. Tin is mined extensively and is an important export. Other mineral products exported which are of considerable quantity are gold, silver, and lead. See AGRICULTURAL EXPERIMENT STATIONS.

COMMERCE. The following commercial statistics were supplied by the United States Bureau of Foreign and Domestic Commerce on the basis of returns from the Chinese Maritime Customs. They are given in Haikwan taels, which in United States money were as follows for the years to which the figures apply: 1913, \$7415; 1918, \$1,193; and for 1919, \$1,359. The following total shows the gross value of the foreign trade for 1913, 1918, and 1919.

Year	Imports Haikwan taels	Exports Haikwan taels	Total Haikwan taels
1913	586,290,431	419,483,420	1,005,773,851
1918	577,643,803	508,633,752	1,086,277,555
1919	679,529,544	663,341,274	1,342,870,818

It is to be noted that the trade of 1913 exceeded that of any previous year. The year 1919 was a prosperous one. Conditions in the Northern China provinces were generally good, and the crops were excellent. The contribution to the export trade from that region was exceptionally large. The Northern Manchurian ports showed a revival of trade in the beginning of the year, but it was checked by the lack of proper means of transport and other reasons. The principal sharers in the trade during the three years above mentioned were Japan, Hongkong, the United States, and the United Kingdom. The percentages were as follows: Japan, 1913, 20 per cent; 1918, 40 per cent; 1919, 37 per cent. Hongkong, 1913, 29 per cent; 1918, 26 per cent; 1919, 22 per cent. The United States, 1913, 7 per cent; 1918, 13 per cent; 1919, 17 per cent. The United Kingdom, 1913, 12 per cent; 1918, 7 per cent; 1919, 10 per cent. The table on page 145 shows the values by countries for those three years.

As will be noted therefrom, Germany and certain other European countries prominent in the trade of China in 1913 had disappeared from the returns for 1918 but reappeared in those for

Countries	Imports			Exports		
	1913	1918	1919	1913	1918	1919

1919. The net value of Chinese trade with foreign countries in 1919 exceeded that of 1918 by \$494,893,935 and that of 1913 by \$1,014,713,240. Exports practically balanced imports for the first time. The most important group of items in the imports was cotton textiles which came to \$285,009,632 as compared with \$180,595,845 in 1918. There was not, however, a corresponding increase in quantity on account of the high prices. The total value of the metal imports in 1919 was \$76,931,631, a great increase over 1913, and there was a corresponding increase in quantity. The imports of machinery in 1919 greatly increased over those of any previous year. Silk is the chief item in the export trade and the largest sharer among the countries of destination has been France. In 1919, however, Japan received 10,226,134 pounds, Hongkong 10,550,799 pounds, and France 9,721,733 pounds. Next in numerical order was the United States which received 8,285,868 pounds. Between 1913 and 1919 there was an enormous increase in the export trade in beans in spite of the large consumption in China, where one of the chief industries is the manufacture of bean-cake and bean-oil. The only important export that had fallen off from the pre-war level was tea. The leading countries of destination for the exports of tea are Great Britain, and the United States. Next to these comes Japan. Exports other than those mentioned that shared a large development in 1919 were eggs, the egg industry having developed more than almost any other during the war period; wood-oil; wheat and flour; and meats, on which an especially heavy demand was made by the Allied countries during the war. The chief metal exports were antimony, pig-iron, iron ore, and tin, the exports of antimony during the war being especially heavy.

RAILWAYS. The report on the government railways issued by the Ministry of Communication of the Republic of China for the calendar year 1918 stated that of 6836 miles of railway in China in that year, over 4000 miles of main and branch lines were owned and operated by the government, these comprising 14 railways in 14 out of the 18 provinces. In addition there were 11 provincial and private railways (some owned by mining companies) aggregating 425 miles and five concession lines aggregating nearly 2300 miles.

The need of additional construction in China was shown by the fact that taking the 18 provinces as a whole, there were in 1918 about 460 square miles of territory and 107,000 population per mile of railway. These figures might be

compared with 40 square miles and 8000 population for India, and 12 square miles and 3800 population for the United States, but owing to the extensive systems of waterways in China which serve the people so generally these average figures always will be higher there than in other countries.

The report also states that the construction cost for the government lines had averaged \$126,000 per mile, ranging from \$80,000 to \$145,000. There were only 13 miles of double track, but sidings and industrial lines raised the trackage to a total of nearly 4300 miles. The equipment included 653 locomotives. Chinese railway equipment must be purchased abroad, therefore it is the policy to extend the life of the engines as long as possible by means of extensive repairs and renewals, rather than to purchase new ones. Operating expenses were 44 per cent of operating revenues. The traffic consisted of 25,475,379 passengers and 18,551,684 tons of freight.

In addition to the complications of international financial, industrial, and political conditions, the famine of 1920 had its effect on the railway situation inasmuch as it seemed likely to reduce earnings and some \$300,000,000 of Chinese Government Railway bonds were held abroad. In 1918 gross operating revenues of the Chinese government railways amounted to \$77,650,000. When revenues derived from government service, and similar items are subtracted, the actual commercial revenue was about \$70,000,000. Of this \$25,000,000 was passenger revenue and \$40,000,000 freight revenue, leaving \$5,000,000 to come from several miscellaneous sources. Out of this \$40,000,000 of freight revenue nearly \$20,000,000 came from agricultural and animal products. Naturally with famine there would be a decrease in passenger revenue and in revenue from agricultural products and with such shrinkage of revenue would go inability to meet interest charges. The traffic in agricultural products on lines like the Peking-Mukden and the Shanghai-Nanking, which run from regions of plenty to regions of want, was heavy, for there was a considerable purchasing power in these districts. While traffic for 1920 held up reasonably well the prospects for the following year were not favorable.

It was realized that new railway construction would in a large measure alleviate the situation, and the Ministry of Communication authorized the building of two short railways, as a beginning. One of these, the line from Shih-chia-chuang to Tsangchow, would connect the Province of Shansi with Tientsin more directly, and

pass through one of the worst famine districts. Another line proposed was from Cheefoo to a connection on the Shantung line, probably at Weihai. Work was to be pushed on the extension of the line under construction toward Suiyuan on the Mongolian border. It was hoped that funds would be available from the Dutch-Belgian loan for the continuance of work on the Lung-Hai line, for this also traverses a famine district. The Siema-Carey Grand Canal project and several other railway contracts quiescent for some years, which ought to be awakened to activity in this emergency, if prosecuted would serve materially to relieve the situation and not only afford return but would keep alive a large rural population in North China.

On the technical side of railway operation and maintenance a number of important innovations were considered during the year. An important change in railway methods in China was announced to begin Jan. 1, 1921, when the railways would assume full responsibility for shipments. Previously, except on the Shanghai-Nanking line, all shipments had been at owner's risk, necessitating sending along a watchman with every consignment, or the use of a forwarding company as an agent. Through billing of goods was to begin on the same date, auditing of invoices to be made in the clearing house located in the Ministry of Communications.

The engineering conference assembled to consider and prepare standard specifications for steel in rails and the tensile strength of bridge materials failed to arrive at satisfactory results on account of the diversity of characteristics in the products of the various manufacturing nations represented in the Chinese railway system. The result was that it would remain with the Ministry to decide upon its own specifications.

SHIPPING. During 1918, 193,567 vessels of 80,247,706 tons entered and cleared Chinese ports. Of these, 3119 were American; 31,034 British; 365 French; 464 Italian; 24,961 Japanese; 1949 Russian; and 130,802 Chinese. In the direct foreign trade the vessels entered had a tonnage of 9,549,571, and cleared of 9,396,183, the leading nationalities being in order of numerical importance, the Japanese, British, and Chinese.

DEFENSE. Provision for a form of conscription came into force Jan. 1, 1916. This provided nominally for about 250,000 men but the actual number did not exceed 180,000. In the disorganized state of the administration, the military governors became virtually independent of the central authority and recruited an army according to their own desires. No means of determining the number exactly were available but the total was placed as high as 1,200,000 in 1919. The largest vessel at the beginning of 1920 had only a displacement of 4300 tons. There were besides this three cruisers of 3000 tons each and two of about 2600 tons. There were also a number of gunboats, torpedo boats and other small craft.

GOVERNMENT. The executive authority is vested in a president and vice-president, and the legislative in two houses, the Senate with 264 members and the House of Representatives with 596. After the setting up of the republic, Yuan Shih-kai was elected first president, Oct. 6, 1913. He died June 6, 1916, and was succeeded in the presidency by Li Yuan-hung. On Oct. 10, 1918, Hsu Shih-Chang was inaugurated. In the meanwhile, owing to the usurpation of the local governors, the central government lost all real au-

thority and for some years past a condition of civil war has prevailed. The governors had not acknowledged the Peking government and in the South a separate administration was set up under Dr. Sun Yat-sen. The cabinet appointed January, 1919, was reorganized in July, 1919, and at the beginning of 1920 was constituted as follows: Premier, Chin Yun-Peng; Minister of the Interior, T'ien Wen-Lieh; Minister of Foreign Affairs, Lou Tseng-Tsiang; Minister for War, Chin Yun-Peng; Minister of the Navy, Sa Chen Ping; Minister of Finance, Li Ssu Hao; Minister of Education, Fu Yu-Fen; Minister of Justice, Chu Shen; Minister of Communications, Tseng Yu-Chun; and Minister of Agriculture and Commerce, T'ien Wen-Lieh.

HISTORY

THE GOVERNMENT'S DIFFICULTIES. After sharp conflict between the different groups a new cabinet was formed under the former acting-president, General Chin Yun-Peng, who also held the portfolio of war. It at once encountered the opposition of the Conservatives who demanded negotiation with Japan and the Foreign Minister resigned February 19th in consequence. At the end of February the Prime Minister resigned for the same reason, but afterwards reached a compromise on the subject and retained office. He resigned finally, however, early in May and was succeeded by Admiral Sa Cheng-Ping.

A party known as the Anfu which was accused of being pro-Japanese and seemed to be under Japanese protection revolted against the government in the North, but was defeated in July. The government ordered the troops disbanded, but instead of that, they were incorporated in the armies of rival military governors and the central government was powerless to enforce its decision. Meanwhile, the ministry was pursuing a policy of reconciliation with the independent government in the South. The financial difficulties of the central government were extremely serious at the very time when the famine was threatening the lives of some 20,000,000 people in the provinces of Chili, Shantung, and Honan. In September after the Peking government showed a desire to come to terms with the government of the South, the Sun Yat-sen was involved in difficulties with revolutionists in its own territory. Dr. Sun Yat-sen, president of the southern republic, declared that the condition of China was worse than it had ever been before, Northern China being completely at the mercy of pro-Japanese reactionaries and a military government backed by an army of 300,000 men having practically become the master of the situation. He went on to say that the only salvation for China was a revolution that would drive out the reactionaries. No improvement in the situation had taken place at the close of the year. There was still a revolutionary government in Canton and another under Sun Yat-sen which persisted in its plan to overthrow the central government which it stigmatized as pro-Japanese. The militarist party still seemed to be in control. The plan for a new constitution was apparently abandoned. Although the pro-Japanese or Anfu had been defeated in July there was still some danger from that quarter, and the Japanese were accused of harboring the fugitive leaders.

On November 6th the Prime Minister, granting for the first time an interview to the journalists, announced that a commission would be ap-

pointed for the settlement of the difficulties between the North and South; that a truly representative Parliament would be elected; a constitution drafted; the civil and military administrations separated; and the reduction of the armies continued. He also declared that the whole financial system would be reorganized.

RELATIONS WITH FOREIGN POWERS. The consortium of foreign bankers to coöperate in financing China which was begun in 1919 completed its arrangements early in the year. The loan of each group required the approval of the foreign department of its government. Japan retained the right to object to any loans that seemed to her to endanger her national existence or to affect her sovereign power. A meeting for the purpose of organizing the loan was held in New York, October 11, by the delegates of the interested Powers, namely the United States, France, Great Britain, and Japan. It completed its work, October 15, the delegates disclaiming any intention of obtaining a hold upon the territories of China. In October the Chinese government deprived the Russian legation and consulates of their official status—the latter being representatives of the old Kerensky party. This action was disapproved in the United States and the American State Department approached the governments of other Powers with a view to taking action against the measure, which was thought to be the result of Bolshevik propaganda. The Chinese minister to the United States, Dr. Wellington Koo, declared that there was no basis for this belief. In answer to questions through the American minister, the Chinese government declared that it would protect Russian interests and had no intention of cancelling Russian concessions. On this subject the former American minister to China, Dr. P. S. Reinsch, declared that British, American and French advisers had counseled China to suspend the payment of the Boxer indemnity to Russia and withdraw recognition of Russian diplomatic representatives in China. It was urged that the Russian officials in China had long ago ceased to represent any government. Another question that aroused in the United States some fear in regard to the influence of Bolsheviks in China was the negotiation undertaken for the resumption of trade with Siberia. In 1920, the Chinese government sent a commission of inquiry to Siberia and Manchuria to investigate conditions on the Chinese Eastern Railway, and it made its report in October. According to this, the Japanese had instigated attacks on the railway by bandits for the purpose of destroying Chinese authority and had done all that they could to interfere with the policing of the road. The ill-feeling toward Japan (see preceding YEAR BOOK, article CHINA) continued throughout the year.

FAMINE CONDITIONS. At a meeting of representatives of the various relief societies at Peking, December 10, the economic condition of the country was reviewed. It was said that there was danger that at least 15,000,000 people would die of starvation in the course of the coming winter. The government was largely blamed for this state of affairs. It was accused of being absorbed in political projects and paying no attention to the needs of the country, which therefore had to be supplied by outside aid. It was said that the administration was exceedingly corrupt, but that the financial difficulties were chiefly due to the militarist policy which sacri-

ficed everything to the maintenance of a huge army estimated at that time at 1,270,000 men. For keeping up this great force more than three quarters of the annual revenue were required and according to some of the critics the cost exceeded the entire revenue. One of the chief difficulties of the situation was the dishonesty of the minor officials which prevented the relief funds from reaching their proper destinations. The situation was complicated by the existence of the rival republic in the South. At that time the chances seemed to be in favor of General Chang Tso-lin in the approaching elections, but in the event of his success, the difficulty would probably be increased as adding to the power of the military party.

The press at the close of the year abounded in items concerning the scarcity in China which was said to be threatening famine in a region inhabited by a population of 87,000,000, that is to say, five entire provinces in Northern China. It was said that a season of extreme drought had left vast areas without food and that families were committing suicide rather than face certain starvation, and selling or drowning their children, and that everywhere might be seen bands of starving people roaming the country in search of food. President Wilson on December 8th appointed a national commission to investigate the subject, with Mr. Thomas W. Lamont as chairman. At the close of the year it was said that there was a probability that 15,000,000 people would starve to death before the winter was over.

CHOSEN. SEE KOREA.

CHRISTIAN ENDEAVOR, UNITED SOCIETY OF. This inter-denominational society of young people was founded in 1881 for the purpose of training young converts for church membership and church work. Statistics for 1920 show 73,681 societies, of which 46,910 were in the United States, 4079 in Canada, and 22,599 in foreign countries, besides 65 floating societies, and 28 army societies. In 1920 there were enrolled 185,857 Comrades of the Quiet Hour, or young people who give a definite time to prayer and meditation every day, and 56,046 members of the Tenth Legion, or young people who give one-tenth of their income to religious work. There were also enrolled in 1920, 5590 Life-Work Recruits, or young persons who are ready to give themselves to full-time Christian service, and 27,889 Christian Endeavor Experts, who have passed an examination in Christian Endeavor principles and methods.

The programme for 1920-21 consists of five points: (1) A 50 per cent gain in membership; (2) the organization of a society in every church in the country; (3) a definite goal in every State for denominational missionary gifts; (4) a field-secretary for at least part time in every State and province; and (5) an alumni Fellowship in every union. Besides these, four other goals have been added in a Loyalty Campaign: (A) An increase of 600,000 new members in the societies; (B) the enrollment of 600,000 Endeavorers for systematic Bible study, the study of missions, church history, stewardship, personal evangelism, social service, or Expert Endeavor; (C) 600,000 vacant seats filled at church services; and (D) 600,000 young people urged to accept Christ and unite with the church.

Reports from foreign countries show steady progress and even in areas devastated by the war the movement has not suffered extinction.

In Germany, before the war, there were 500 societies. By the end of 1920 there were nearly 1000 societies. In Budapest, Hungary, the union has for years conducted a large hospital. Finnish secretaries have carried the message in 1920 to Esthonia, where a great revival broke out, and other Balkan provinces, and large societies have been formed there. In Poland also the societies are flourishing. Mexico has reestablished the union of societies and has held a successful convention, and leaders in Brazil are planning an All-South American convention in 1922. In the United States more than 20 field-secretaries are now employed by the various State unions. A great world's convention is planned for New York City July 6-11, 1921, the chairman of the convention committee being Hon. Frederick A. Wallis, commissioner of immigration at the port of New York. In 1920 there were 190 Alumni Fellowships with a membership of nearly 11,000, whose annual contributions make possible the financing of Christian Endeavor both at home and abroad.

In 1920 the officers were: President, Rev. Francis E. Clark, D.D., LL.D.; Associate President, Rev. Daniel A. Poling, LL.D.; General Secretary, Edward P. Gates; Treasurer, Alvin J. Shartle; Editorial Secretary, Rev. Robert P. Anderson. Headquarters are maintained at 41 Mt. Vernon Street, Boston, Mass.

CHRISTIANS. The last quadrennial convention of this denomination was held in 1919, to which the following statistics were reported: 105,310 communicants, 1204 churches, 957 ministers, and 963 Sunday Schools with 76,055 pupils. National headquarters of the denomination are at The Christian Publishing Association, Dayton, Ohio. During 1920 the Midwest Christian Convention, including the states of Ohio, Indiana, Michigan, Illinois, Pennsylvania, Wisconsin, and Kentucky has been organized. This places the entire church in five territorial conventions: New England, Southern, Metropolitan, Midwestern, and Western Conventions. Each State has its State association and the territory within each State has its several district conferences.

The Forward Movement of the church has occupied its attention in a five point programme during the year. The financial goal has been \$5,000,000. In the Southern Christian Convention the per capita quota has been \$70 per member. A Christian Temple is being erected at Winona Lake, Indiana, to accommodate the general meetings of the denomination at this religious centre. During the year the Commission on Christian Unity has sent communications appealing to the other denominations of the country in the interest of the union. A system of summer schools has been arranged for the season of 1921 to avoid conflict and rotate a part of the same faculty for all. These will be held at Craigville, Mass.; Virginia Beach, Va.; Defiance, Ohio; Winona Lake, Ind.; Merom, Ill.; and Albany, Mo. The Educational Board has inaugurated a system of scholarships for ministerial students. In conjunction with the Home Mission Board and the Forward Movement Committee a special drive is being made to secure candidates for the ministry. A plan is being put into operation for the installation of Field Secretaries to cover all of the territory of the church. These will be especially trained for their work and periodic conferences held for the development of their efficiency. The regular Home Mission con-

tributions of the church exceeded all former annual records by 18 per cent. By the addition of the Forward Movement receipts for this department the increase was 150 per cent. Special demonstration specialized work has been inaugurated at the University of Illinois, Americanization at Haverhill, Mass., and in the lumbering camps of the Pacific Coast. The church sent out the largest number of new foreign missionaries in its history during the past year. They were sent to Japan and Porto Rico. A Council of College Presidents is being formed to plan a programme for their mutual work and unify their tasks. The first session will be held at Palmer College, Albany, Mo., this spring and annually thereafter. The group is at present in a drive for \$1,000,000 for endowment. Franklinton Christian College, a school for the negroes, has been under the management and faculty of white people until this year. The Afro-Christian Convention has now assumed the responsibility for the institution and members of their own race constitute the faculty. After the first half-year the change promises a great improvement. The Women's Missionary organizations of the church have been active and successful above all former efforts. No department of the church has created a greater volume of propagandic literature. They have assumed entire responsibility for points in both the Home and Foreign Mission fields.

The official organ of the denomination is the *Herald of Gospel Liberty*, while the *Christian Missionary* is the official organ of the Department of Missions.

CHRISTIAN SCIENCE. The annual meeting of the Mother Church of this denomination was held in Boston, Mass., in June, 1920. There were gathered there more than 5000 persons from all parts of the world. All reports showed considerable progress during the year. The delegates, with much enthusiasm, reaffirmed their loyalty to the Manual and the Board of Directors. The directors are Adam H. Dickey, James A. Neal, Edward A. Merritt, William R. Rathvon, and Mrs. Annie M. Knott. John W. Doorly, the retiring president, announced the officers for the following year: President, Willard P. Emery, of Detroit, Mich.; treasurer, Edward L. Ripley; clerk, Charles E. Jarvis; first reader, John Randall Dunn of St. Louis, and second reader, Miss Margaret Glen of New York City. Progress was reported in Stockholm, Geneva, Amsterdam, and Copenhagen. Growth of the movement was also announced in Australia, England, Holland, Sweden, Norway, and Italy. The German government, in 1919, had forbidden the Christian Scientists to hold public services, and a report from the church in Dresden, Saxony, said that since the overthrow of the old régime, services had been renewed with marked evidences of interest. President Emery in his opening address said, "Never has there been a time so rich in opportunity for the Christian Scientist to show the world that he has a practical, livable, useful, true understanding of divine principle to apply to his everyday affairs. We must all share in the establishment of right and peace." The report of the clerk showed that during the year 2373 lectures on Christian Science were delivered by the members of the Board of Lectureship to an approximate aggregate of 1,891,958 persons in 21 countries besides the United States. War relief work is being carried on in France, Swit-

zerland, and Italy by local churches, and general relief work in Germany to help in feeding the population. On Oct. 1, 1919, the Christian Science Benevolent Association opened a sanatorium in Brookline, Mass., for purposes of healing the sick. During the year ending May 31, 1920, the trustees under the will of Mary Baker Eddy expended "for the purpose of more effectually promoting and extending the religion of Christian Science," the sum of \$351,953.75. This money was used to assist needy churches and societies throughout the country. The treasurer's report for the year ending May 31, 1920, showed total receipts of \$438,336.87 and total expenditures of \$583,382.47. Total receipts for the real estate fund were \$72,812.83, and total disbursements were \$70,448.87. The sum of \$521,886.40 was received for the construction and maintenance of the sanatorium. Reports from various churches and societies in this country and abroad were read during the course of the meeting. The First Church in London reports that "a striking feature of the past year has been the large and overflowing congregations which have attended the Sunday morning and Wednesday evening meetings." Very favorable reports were also read from other Christian Science churches in London, Durban, Natal, South Africa, Melbourne, Australia, Hull, Yorkshire, England, Berlin and Dresden, Germany. The report on publications shows that no important works have been published during the year, although many pamphlets, booklets, and reprints were issued.

The Christian Science Publishing Society in Boston publishes the *Christian Science Sentinel*, *Christian Science Journal*, *Christian Science Quarterly*, and the *Christian Science Monitor*, besides 67 pamphlets on various phases of Christian Science.

CHRISTMAS ISLAND. An island in the Indian Ocean, 200 miles southwest of Java, known for its extensive deposits of phosphate of lime; area about 43 square miles; population in 1918, 2181. The inhabitants are mostly engaged in the phosphate industry which is the sole source of the island's wealth. In 1918 the exports for phosphate amounted to 53,370 tons as compared with 89,889 tons in 1917. Tonnage entered and cleared in 1918, 71,926. There is a railway on the island. Politically, Christmas Island has been incorporated with the settlement of Singapore since 1900.

CHURCHES OF CHRIST IN AMERICA, FEDERAL COUNCIL OF. See FEDERAL COUNCIL OF CHURCHES OF CHRIST IN AMERICA.

CHURCHILL, WILLIAM. Editor, anthropologist and philologist, died at Washington, D. C., June 9. He was born at Brooklyn, N. Y., Oct. 5, 1859, graduated at Yale College, 1882, and then passed several years in the Southern Seas where he was consul-general at Samoa and Tonga. From 1902 to 1915 he was an editor on the staff of the *New York Sun*. He was a prominent member of the National Geographic Society and of other learned bodies and the editor of the Malayo-Polynesian department of the *Standard Dictionary* in 1912. His writings include elaborate works on the study of Polynesian languages and many articles for the learned periodicals on anthropological and philological subjects.

CILLEY, JONATHAN PRINCE. Soldier, died April 7. He was born at Thomaston, Md., Dec. 29, 1835; graduated at Bowdoin College in 1858, and was admitted to the bar in 1860. He entered the Civil War as captain of Maine infantry in 1861 and served to the close of the war, having distinguished himself for gallant services. After the war he resumed the practice of law and was a member of the Maine House of Representatives, in 1869. In 1894 he was editor of the *Maine Bugle*.

CINCINNATI MAY FESTIVAL, See MUSIC, *Festivals*.

CINCINNATI, UNIVERSITY OF. A co-educational municipal institution at Cincinnati, Ohio, founded in 1871. In the summer session of 1920, there were 749 students and in the autumn regular session there were enrolled 3686 students, of whom 861 were in the Liberal Arts, 945 in the Engineering College, and 134 in the Graduate School. Besides the departments above mentioned, there are a teacher's college, law school, medical college, school of nursing and health, and academic and commercial evening courses. The members of the faculty numbered 370 and 12 were added in the course of the year. The income from productive funds was \$116,118 and the total income throughout the year was \$702,016. The library contained 150,100 volumes and 79,000 pamphlets. The gifts of the year included endowments from the Carnegie Corporation, the Rockefeller Foundation, and from Mrs. Mary M. Emery, Mrs. C. R. Holmes, Mrs. Henrietta Fleischman, Mr. and Mrs. Charles P. Taft, and a gift from general public subscription. President, Frederick Charles Hicks.

CITY GOVERNMENT. See MUNICIPAL GOVERNMENT.

CITY-MANAGER PLAN. See MUNICIPAL GOVERNMENT.

CITY PLANNING. The number of cities engaged in city planning continues to increase as well as the scope and thoroughness of the work. For tangible results in the city planning field, zoning was far in the lead during the first year, both as regards studies undertaken and schemes either adopted or made ready for final action. The greater progress in zoning than in other matters affecting the city plan is largely due both to the growing realization of the fundamental character of zoning as affecting almost all other phases of city planning, and to the fact that putting zoning plans into effect causes no direct drain upon the city treasury, while large expenditures are required for street widening, opening new streets, enlarging electric and steam railway facilities, establishing parks, civic centres and the like. Zoning is a sort of self-denying ordinance, or the adoption of a series of regulations essential to the establishment and orderly development of a city plan. By restricting certain portions of the city to residences of different classes, others to business, and still others to manufacturing, by prescribing the height to which buildings may be carried in different parts of the city, by limiting the percentage of the area of lots which may be built upon—or in other words, by the establishing of use, height, and area districts—the needs of various parts of cities in the way of street widths, character of

surfaces, and various public utilities may be intelligently planned to meet requirements years hence.

CITY PLANNING COMMISSIONS. Provision for comprehensive city planning was so universally neglected until within the past 10 to 20 years that when it began to be taken up the creation of an entirely new branch of city government seemed to be the only possible thing to do. City planning naturally falls in the engineering department of the city so far as the design and actual planning is concerned, but the final adoption of plans must rest with the legislative or ordinance making departments. City planning powers in the United States have not yet been given to engineering departments and until recently city councils have taken no cognizance of the subject. Under such conditions and in view of the large amount of educational and publicity work required before not merely the general public but also the local governing body could be brought to the need for a city plan, the usual American method has been followed in the city planning as in other new fields, that is, special commissions have been created to make city planning studies, formulate plans, win public interest and support, and finally to inspire city councils with sufficient interest and confidence in the wisdom of the plan to secure their adoption by those bodies. Many, in fact probably the majority, of the existing city planning commissions have only advisory powers. But in a growing number of cases, through either general enabling State legislation or as a part of carefully phrased new city charters, city planning commissions are given a certain measure of joint jurisdiction with city councils over city planning. This may go as far as to provide that no public improvement affecting the general plan of the city—such as changes in the street system, waterfront, railways, parks, or location of public buildings—shall be made by the city council without having been first passed upon by the city planning commission. In some cases the control goes farther than this; in fact, there may be a certain measure of coordinate jurisdiction by the city planning commission and the city council, although the body possessing powers of appropriating money for public improvements, the city council, has the final say as to changes in the city plan. The present strong tendency, and the method that meets with general approval among those who have given the subject careful attention, is to vest in city planning commissions at least broad powers to make city planning studies and submit to the city council a comprehensive scheme for the future development of the city plan. To coordinate the work of the city planning commission with that of the more firmly established branches of the city government it is quite common to make two or more of the regular city officials ex-officio members of the city planning commission. Frequently and quite logically the city engineer or commissioner of public works is made a member. Whether this is done or not, most of the city commissions that are making real progress are provided with a city planning engineer who has one or more assistants, according to the size of the city and the volume of work being attempted. The number of city planning commissions in the United States is not definitely known, but may number 200 since the early part of 1920. Pennsylvania alone had 26 commissions, and for some years past it

has been compulsory for every city in Massachusetts and for every town of more than 10,000 population to have a commission while similar commissions are compulsory or permissive for some classes of cities in many other States. According to a statement issued late in 1920 by Flavel Shurtleff, secretary of the National Conference on City Planning, at least 32 cities started active city planning programmes during the year. The list follows: Auburn, Me.; Fall River and Springfield, Mass.; Newport, R. I.; Bristol, Conn.; Perth Amboy, N. J.; Chester, Pa.; Norfolk, Va.; Atlanta, Ga.; Memphis and Knoxville, Tenn.; New Orleans, La.; Columbus and Youngstown, Ohio; Anderson, Muncie, Terre Haute, Indianapolis, and Marion, Ind.; Rockford and Decatur, Ill.; Grand Rapids, Kalamazoo, and Lansing, Mich.; Oklahoma City, Okla.; Kansas City, Wichita, and Topeka, Kan.; Phoenix, Ariz.; Kansas City, Mo.; Spokane and Tacoma, Wash. The diversity of practice in appointing new commissions is shown by the following regarding some of the commissions created in 1920: Atlanta, Ga., has created a city planning board of 25 members; a new commission at Davenport, Iowa, consists of 12 citizen members with the mayor and city attorney as members ex-officio; at Kansas City, Mo., the new commission has eight members, and there is also an advisory city planning board, consisting of ex-officio and other members, the former including the city engineer and the landscape architect of the park department, while the latter include the members of the Board of Control of the Kansas City Railways Co.; across the river in Kansas City, Kan., a commission of seven members, one from each ward of the city, was established; a new commission at Los Angeles has 51 members "men and women." Chambers of commerce or similar commercial bodies often do the large amount of pioneer work required in many cities before city authorities, who should lead the way, have the conviction or the courage to create a city planning commission. Thus, late in 1920 a committee of the Commercial Club of Duluth, Minn., submitted a report advocating the creation of a commission from which the following is taken: "A city planning commission must have authority to act. The commissioners should be chosen by the judges of the District Court from men who are free from political affiliations and who are not influenced by selfish motives in seeing the city develop along practical and economic lines. The commission would employ a city planning expert as is done in Chicago, Cleveland, Portland, Washington, etc., who will prepare the plans, arrange the zones and advise the commission on all architectural engineering, landscape, water front, main arteries, streets, parks, etc.; he will employ his own experts, and will co-operate with and receive all assistance from the city engineer's and water and light department engineer's offices. He will also act for the city as between the electric light, street car and telephone companies, coöperate with the traffic squad of the police department and with the fire department and the mail carriers' division of the post office, unite all the requirements of these bodies and consider the same in relation to alterations of the present main arteries and future extensions, the platting of new districts and subdivisions. Such a commission can organize the development of zones so that property-owners will feel reasonably sure of the maintenance of

their property values. There is no such assurance at present." The proposal that the members of the commission should be appointed by the "Judges of the District Courts" and the reasons therefore given in the quotation are eloquent testimony as to the lack of confidence in the regularly constituted authorities of our cities to conduct municipal affairs in a businesslike manner. In the tentative draft of the new city charter for Montreal, Canada, nearing completion in the latter part of 1920, provision is made for a city planning commission along the lines laid down in the model city charter framed by the municipal programme committee of the National Municipal League a few years ago. The tentative scheme for Montreal provides for a city planning board of five members to include the director of public works and the director of public utilities and three citizens chosen for their knowledge of city planning. All acts of the city government affecting the city plans would be submitted to the board for report and recommendation before adoption by the city council. The planning board would be required to submit annually to the city council a report summarizing the board's activities for the fiscal year covered, together with a plan for improvement of the city plan year by year during the three ensuing years, with cost estimates. During the past year the city planning board of St. Paul, Minn., put at the head of its board one of the principal members of the city engineering staff of St. Paul who gave up his old position for the new. The board has been in existence about a year and through the good showing that it has made has obtained an appropriation of \$50,000 for use during two years in order to make surveys and an improved city plan.

CARRYING OUT CITY PLANS. The Chicago Plan Commission leads the country in the progress it has made in carrying out the city plan formulated with great care a dozen years ago. A summary of the work done during the 10 years 1909-19, published in 1920, showed 12 major public improvements promoted by the commission and already under way. Including money contributed from all sources these improvements will cost about \$230,000,000, including \$61,500,000 provided by bonds voted by the people; over \$8,000,000 to be met by special assessments; \$162,000,000 to be spent by various railway companies, and \$5,300,000 to be expended by the Forest Preserve Commission. The improvements include street widening and extensions, and street double decking; railway passenger and freight terminals with street approaches; lake front improvements; railway electrification; the acquirement of 14,250 acres of forest preserve; and the development of an outer highway system. The "Plan of Chicago" was made under the leadership of the late Daniel H. Burnham with the encouragement and financial aid of the Commercial Club and was presented to the city with the request that a commission should be created to continue the study and to recommend what part of the plan should be carried out from time to time. The Chicago Plan Commission was appointed Nov. 1, 1909, and made a part of the city government. It has some 300 members, including engineers, architects, business men and city officials. A managing director is employed. City planning work at St. Louis, mentioned in earlier YEAR BOOKS, is being continued with vigor. Progress on the major street plan, con-

sisting of street widenings and openings, was reviewed by Harland Bartholomew, engineer, City Plan Commission, in *Engineering News-Record*, May 13, 1920. Yearly appropriations for the commission for nine years past ranged from \$5000 to \$25,000, that for 1919-20 being \$19,160. Two studies for rapid transit improvements in St. Louis, one made by the City Plan Commission and the other by the St. Louis Department of Public Utilities, are summarized in the *Electric Railway Journal* for Jan. 8, 1921. Both plans are based on traffic investigation studies made by the City Plan Commission. At Detroit the city council has approved a part of the work for the Dix-High-Waterloo thoroughfare proposed by the city plan commission to relieve traffic congestion. This would form a cross-city boulevard across the city from east to west about a mile north of the Detroit River approximately 12 miles long and crossing through the eastern market place and directly in front of the Michigan Central Railroad station. High Street and its extensions in the more congested sections of the city would be widened to 80 feet, which, in accordance with recent standards, is considered sufficient for the newest types of auto trucks and other commercial vehicles. The consideration that should be given to modern motor vehicles in city planning studies was discussed in a paper on "The Urban Auto Problem" by Ernest P. Goodrich before the National Conference on City Planning at Cincinnati in May, 1920. Among other things, Mr. Goodrich suggested heavier pavements, the equivalent of greater street widths in some special cases by providing trafficways at several levels which would segregate the different classes of traffic; private rights of way for automobile trucks carrying freight to railway stations; rounding off street corners and setting back buildings at important intersections, and for extremely heavy traffic "pairs of one-way streets in lieu of extra wide thoroughfares." At the same conference William J. Wilgus read a paper on the "Relation of Railroad Terminal Problems to City Planning." Summarizing, he urged that "passenger and freight terminals for serving the community should be so located, in liaison with suitable lines of urban distribution, that the business and residential sections shall be given ample opportunity for healthy expansion, that congestion will be avoided on the city streets; that full opportunity will be given for the esthetic development of the community, and the delays and cost to the public will be reduced to the minimum." Inner and outer railway belt lines were suggested.

An element of city planning, in this case on a large scale, is illustrated by the plan for the further development of rapid transit for New York City, designed to provide for the needs of the next 25 years. This plan, which was submitted by Daniel L. Turner, chief engineer of the Transit Construction Commission of New York City in the latter part of 1920, provides for 830 miles of single track at an estimated cost of \$350,000,000. Special features of the plan are 21 two-track subaqueous tunnels, three cross-town moving platforms, and two-story subways having eight and six tracks. (For extensive extracts from the report, with map, see *Engineering News-Record*, Oct. 14, 1920.) Taking a still broader view of city transportation needs by considering the whole metropolitan district of New York, an evening was given to the presenta-

tion and discussion of a paper by Henry M. Brinckerhoff before the New York Section of the American Society of Civil Engineers on Nov. 17, 1920. The study took into account the rapid transit needs of the 5,830,000 population (census of 1920) in New York City and the city of Yonkers, and the 1,720,000 population in the five trans-Hudson counties of New Jersey, making a total population of 7,550,000. By 1945 Mr. Turner, in the report mentioned above, estimated that the population of New York City alone would be 9,000,000. The growth to the west, now largely cut off by the Hudson River barrier, should be provided for according to the views presented by Mr. Brinckerhoff. Suggestions were presented for east and west rapid transit routes extending from Long Island across the East River, Manhattan Island, the Hudson River, and well to the westward into New Jersey. As a means of breaking down the "artificial political Chinese wall," the boundary between the State of New York and the State of New Jersey, Mr. Brinckerhoff suggested adding "a 49th State to the Union" and naming it the "State of Manhattan." He would let New York City, Jersey City, and Newark keep their own local governments, but would "place matters of common interest to the whole metropolitan area, such as transportation, water, sewerage, and port development, in the hands of a governmental body representing the people of all metropolitan New York." At a subsequent 1920 meeting of the same engineering society, the needs of the metropolitan port of New York were considered (see *Engineering News-Record*, Nov. 25 and Dec. 23, 1920, for the rapid transit and port discussions).

ZONING. Besides zoning plans completed during the year, zoning work was begun in a number of cities, of which only a few can be mentioned. At Philadelphia, under the new charter, the mayor appointed a zoning commission of 18 members, of which seven were heads of departments, nine represented various local organizations, and two were unattached. The City Planning Commission of San Francisco completed a tentative zoning ordinance about the middle of the year after considerable study and mapping work done under the direction of the city engineering department. Six use zones were proposed: (1) For single family dwellings; (2) for all classes of residences and various other buildings not considered detrimental to a residence section; (3) a commercial district in which residences allowed in (1) and (2) would be permitted; (4) light; and (5) heavy industrial districts; (6) slaughter house and unrestricted sections. At Portland, Ore., a zoning ordinance dividing the city into eight use and six height districts and containing restrictions as to the area of lot that may be occupied by each building was adopted early in the year by the city council, but was defeated on referendum vote at the November election. The popular majority against the ordinance in a total vote of over 60,000 was less than 1000. The defeat of the scheme was attributed in part to division of interest with the scores of names and measures to be voted for on the same ticket. After the election petitions were filed with the city council by 149 city precincts that voted yes, asking that they be allowed to come under the zoning ordinance. Meanwhile, the city has the advantage of the building code which provides that before permits for buildings of several classes can be granted, hearing must

be given to all the property owners within 200 feet of the proposed building. A zoning ordinance adopted at Niagara Falls provides for the future division of the city into eight use districts and places a limit upon the height and bulk of buildings thereafter erected in the various districts and upon the areas of yards, courts, and other open places. Under the ordinance the city council will create a zoning commission of five members to plan the districts provided for in the ordinance and to see that the terms of the ordinance are carried out. Any proposed amendment to the zoning ordinance must go to the zoning commission, be reported upon by it, and must be acted upon by the city council within 30 days and no amendment to the ordinance can be adopted by the council contrary to the recommendation of the zoning commission except by unanimous vote of the council. Violations of the zoning ordinance are made misdemeanors subject to fine or imprisonment or both. At Milwaukee a city zoning ordinance was framed by the Board of Public Land Commissioners, which is in effect the city zoning and planning commission, and submitted to the city council. It provides for use, height, and area of buildings. A report embodying a tentative zoning plan for Lakewood, Ohio, notable for its exposition of zoning principles, especially for a city that is chiefly residential in character, was made to the local authorities late in the year by Robert H. Whitten, advisor to the City Planning Commission of Cleveland, Ohio. The city is divided into six classes of use districts, of which two are residential and four are business and industrial. There are four classes each of height and area districts. The height and area districts are superimposed over the use districts so that each portion of the city is in some one of the six classes of use districts, in some one of the four classes of height districts and also in some one of the four classes of area districts. The boundaries of the various classes of districts are all shown on a single map. (See *Engineering News-Record*, Oct. 21, 1920.) Acting under Congressional authorization of March 1, 1920, requiring that a zoning plan be prepared and go into effect on September 1st following, a zoning scheme for the District of Columbia was prepared within the time stated by a Zoning Commission consisting of the commissioners of the District of Columbia, the officer in charge of public buildings and grounds of the District of Columbia, and the superintendent of the United States Capitol Building. An appropriation of \$5000 was made for the work. The chairman of the committee was Col. C. W. Kutz, engineer commissioner, District of Columbia, and Harland Bartholomew, engineer of the St. Louis City Plan Commission, was consultant. The enforcement of the zoning plan is vested in the Commissioners of the District of Columbia. The plan provides for residential, first and second commercial, and industrial districts; height districts with limits of 35, 55, 85, and 110 feet; area districts for detached and semi-detached houses in which rear yard and one side yard are required and buildings may occupy 40 per cent of an interior lot and 50 per cent of a corner lot; area districts for row houses and small apartments in which a rear yard is required and buildings may occupy 60 per cent of an interior lot and 70 per cent of a corner lot; areas for larger apartment houses, stores, and shops, located in the commercial district, in

which commercial buildings may occupy 100 per cent of the first floor level but other buildings may not occupy more than 75 per cent of an interior lot or more than 90 per cent of a corner lot; an area district consisting of high valued downtown area territory in the second commercial district and the industrial districts in which a rear yard is required on interior lots above the first floor and a lot occupancy of not more than 90 per cent is permitted.

LEGAL DECISIONS UPHOLDING ZONING. An important decision was rendered by the New York State Court of Appeals upholding the zoning regulations adopted in 1916 by the New York City Board of Estimate and Apportionment. The portion of the zoning ordinance of East Cleveland, Ohio, which prohibits the building of apartment houses in certain areas of the city was upheld in the Court of Common Pleas of Cuyahoga County. Excerpts from the East Cleveland decision are given in *Engineering News-Record*, May 20, 1920. The decision of the New York Court of Appeals held that the zoning regulations in question cannot be considered as "an incumbrance since it was a proper exercise of the police power" which "within constitutional limitations depends largely upon the discretion and good judgment of the municipal authorities with which the courts are reluctant to interfere." This decision was rendered in a suit brought by the Lincoln Trust Co. against the Williams Building Co. to secure cancellation of a land purchase contract on the ground that, owing to the zoning regulations, an unencumbered title could not be given. The Court held that the contract in question was deliberately entered into and that it was not "claimed that defendant was misled, deceived, or improperly influenced in making it." A decision having at least an indirect relation to zoning handed down by the State Supreme Court of Minnesota on Jan. 23, 1920, in a mandamus suit brought by the Twin City Building Investment Co. against James G. Houghton, inspector of buildings, to compel the inspector to grant a permit for an apartment house, established the validity of a Minnesota statute of 1915 authorizing Minnesota cities of the first class (Duluth, Minneapolis, and St. Paul) to establish restricted residence districts and exclude apartment houses therefrom by condemnation proceedings. The Court said in part: "It is time the Court recognized the esthetic as a factor in life. Beauty and fitness enhance values in public and private structures, and it is not sufficient that the building is fit and proper standing alone; it should also fit in with surrounding structures. People are beginning to realize this and are calling for city planning by which individual houses may be segregated from industrial and mercantile districts and also from hotel and apartment districts. The act in question responds to this call. . . . We think there is a public use served by the taking authorized by the law of 1915. It does not seem to impinge any inhibition of the State or Federal constitution."

For many other details see Theodora Kimball's "Review of City Planning in the United States, 1919-20" (January, 1921, "National Municipal Review," New York City), and a pamphlet edited by Miss Kimball from information largely gathered by the Detroit City Plan Commission, entitled "Municipal Accomplishment in City Planning" and a list of Published City Reports

in the United States (National Conference on City Planning, Boston).

CIVIC FEDERATION, NATIONAL. See NATIONAL CIVIC FEDERATION.

CIVIC SERVICE REFORM LEAGUE, NATIONAL. This organization, founded in 1881, is devoted wholly to governmental administrative efficiency in the United States. The Thirty-Ninth Annual Meeting of the League was held at Springfield, Mass., on Feb. 26, 1920, at which addresses were given by Hon. Montgomery Schuyler, former minister to Ecuador, Oscar K. Davis, Ellery C. Stowell, William G. Rice, President of the New York State Civil Service Commission, Richard H. Dana, the President of the League, and Hon. Robert Catherwood. Mr. Dana pointed out the recent achievements of the League: For the national service it has aided in securing needed experts on war problems; it has deflated several bills exempting numerous positions from the merit system; it has brought to public attention the incompetency of the explosive inspectors, and of the War Risk Insurance Bureau; it has secured reorganization in the National Civil Service Commission; it has secured a merit system for the appointment of the 9000 presidential postmasters; and it has secured needed reforms in several of the states. The League has been especially active against several "spoils" provisions in bills introduced into Congress. One of these was the 1920 Census bill with its Veteran Preference rider, and another was the Volstead Bill with its provision for prohibition enforcement officers. Modifications were gained on each of these bills. The League has protested strongly against the exemption from the merit system of Deputy Collectors of Internal Revenue, but to no avail.

The Committee on Foreign Service continued to push its recommendations, notably, that the age limit for entering the foreign service be reduced so as not exceed 30 years; the salaries be increased; embassies and consulates be purchased in the principal cities; that the State quota system of appointment be abolished; and the Americanization of the consular service be completed by the appointment of salaried vice-consuls to act in the place of foreigners now serving. Statistics gathered by the committee show that in 1918 there was \$8,874,345,044 of foreign trade (exports and imports) for which there was a total appropriation for the Foreign Service department of \$686,886.09 or \$77.40 per million dollars of foreign trade.

In 1919 a noteworthy addition to the original program of the League was that of applying the merit system to higher directing officials and injecting into the whole of the public service scientific business managers and efficiency experts. This program was pushed actively during the past year. The officers for 1920 were: President, Richard H. Dana; treasurer, A. S. Frisell; secretary, George T. Keyes; and chairman of the executive committee, Arthur R. Kimball. Headquarters are maintained at 8 W. 40th St., New York City.

CLAASSEN, ARTHUR. American conductor, Died in San Francisco, March 16. He was born in Stargard, Germany, Feb. 19, 1859. He received his musical education from Müller-Hartung and A. W. Gottschalk in Weimar, where his first compositions also attracted the attention of Liszt. Having been operatic conductor at Göttingen and Magdeburg, he came to America in 1884

as conductor of the Brooklyn Arion, which under his leadership soon became one of the finest singing societies in the East. This post he held for 25 years, appearing also frequently as conductor-in-chief of many great singing festivals. In 1910 he removed to San Antonio, Texas, where he founded the Symphony Orchestra and the Beethoven and Mozart Societies (both choral), all of which became important factors in raising the musical standards of the South. He has written a number of fine male choruses a *capella*; a *Festival Hymn* for soli, chorus, and orchestra; a symphonic poem, *Hohenfriedberg*, and other works for orchestra.

CLAIRE, HENRY LEWIS. British surgeon, died January 24. He was born at Dublin, Ireland, 1858, and was educated at Trinity College, Dublin. He held several appointments in the Jamaica medical service, where he was president of the Jamaica branch of the British Medical Association. In 1913 he was president of the first West Indian intercolonial division on tuberculosis at Trinidad and was appointed surgeon-general and chief medical official of health for the colony of Trinidad and Tobago in 1907, which position he was holding at the time of his death. His publications included various reports on public health.

CLARKE, THOMAS SHIELDS. Painter and sculptor, died in New York City, November 15. His work had been displayed at many of the large exhibitions in America. He was born at Pittsburgh, Pa., on April 25, 1860; graduated at Princeton in 1882 and studied in France and Italy. His work won medals in exhibitions at London, Madrid, Berlin, Paris, and at the Chicago exposition. He was a member of the Royal Society of Arts of London and other well known art societies. In New York, San Francisco, Chicago and other cities there are many works of his in bronze and marble, among which may be mentioned the "Cider Press Monument" in Golden Gate Park, San Francisco, Cal.

CLARK UNIVERSITY. A non-sectarian institution for graduate study only at Worcester, Mass., founded in 1889. In the fall of 1920 there were 50 students enrolled in the graduate department and 205 in the collegiate. There were 27 members in the faculty. The endowment funds of the institution amounted to \$4,239,350, and the income for the year was \$191,620. There were 91,000 volumes in the library. President, Wallace W. Atwood.

CLASSICAL LITERATURE AND SCHOLARSHIP. See PHILOLOGY, CLASSICAL.

CLAY, CECIL. British social leader and humorist, died in London, May 26. He was born in 1847. For many years he was a familiar figure in London club-land. He was educated at Harrow and Oxford where he distinguished himself chiefly in athletics. His father was a politician of some note and a friend of the eminent men of his time. Young Cecil early showed an especial gift for conversation and became a prominent and attractive figure of society. He wrote for the stage *A Pantomime Rehearsal* which enjoyed much popularity and which was frequently repeated. His first wife was Rosina Vokes whom he accompanied to America, and his second wife, Miss Grace Toulmin, the niece of Sir Charles Young, who wrote *Jim the Penman*.

CLAY PRODUCTS. The value of the clay products marketed in the United States in 1919

was estimated by the United States Geological Survey, at \$260,790,000, the highest yet recorded. This is an increase of \$40,216,000 compared with 1918 and \$28,277,000 compared with 1917, and is nearly \$100,000,000 greater than the value ten years ago. The value of brick and tile products constituted 71 per cent and that of pottery products 29 per cent of the total. The removal of war-time restrictions, the partial return to normal conditions, and the crying need of the country for buildings of all kinds, which consume the greater proportion of the clay products, caused the great increase in the output and value of the clay products marketed in 1919, though the increase in the selling price no doubt helped to increase the value. Every kind of clay product except fire brick made a gain in quantity as well as in value, and the increase in the output of almost every product was greater proportionally than the average increase in price. The increases in 1919 were made in spite of a shortage of labor, fuel, and transportation and the timidity of capital to invest in new buildings on account of the high cost of construction and the consequent small returns. The large decrease in the output and value of fire brick, which was used in immense quantities in the manufacture of munitions during the war, was only natural. Another cause for the decrease, however, was the strike in the steel industry, the principal consumer of fire brick.

CLEGHORN, JAMES. British surgeon, died, June 14. For some years before his death he had been surgeon-general in the Indian medical service. He was born in 1841 and graduated at Edinburgh University and at the Royal College of Surgeons, Edinburgh. Having entered the Indian medical service in 1865, he became director-general and sanitary commissioner. In 1897 he was the delegate of the Indian government to the Venice plague conference. His publications included many papers in the medical journals.

CLEOPATRA'S NIGHT. See MUSIC, Opera.

CLERY, JAMES ALBERT. British surgeon, died February 10. For some years before his death he was surgeon-general of South Africa. He was born in Ireland, Dec. 21, 1846, and educated at Trinity College, Dublin. Having entered the army in 1871, he served in the Nile expedition, in the Sudan, and in the Boer War, winning medals and frequent mention in despatches. He retired in 1906.

COAL. The following table prepared by the United States Geological Survey in 1920 shows the world's production from 1910 to 1919:

THE WORLD'S PRODUCTION OF COAL,
1910-1919
(Metric tons of 2,205 pounds)

Year	Production in part estimated	Per cent. produced by United States
1910	1,160,000,000	89.2
1911	1,189,000,000	87.9
1912	1,249,000,000	88.8
1913	1,341,000,000	88.5
1914	1,208,000,000	88.5
1915	1,190,000,000	40.5
1916	1,270,000,000	42.1

1917	1,386,000,000	44.2
1918	1,332,000,000	46.2
1919	1,170,000,000	42.1

The figures after 1913 are not final on account of the interruption in the compilation of government statistics, especially in central and eastern Europe. The following table shows the production of the United Kingdom, France, Belgium, Germany and the United States in 1913 and 1919, respectively, in millions of metric tons.

	1913	1919
United Kingdom	292	237
France (present boundaries)*	44	22
Belgium	23	18
Germany (present boundaries) ^b —		
Bituminous	173	109
Lignite	87	94
United States	517	494

* Includes Alsace-Lorraine. ^b Excludes Alsace-Lorraine and the Saar.

From 1913 to 1919 the output of bituminous coal in the four countries shown in the above table fell from 532,000,000 to 386,000,000 of which decrease, nearly 40 per cent was in Germany and about 20 per cent in the United Kingdom and Belgium. The output of the Saar Valley fell from about 12,000,000 in 1913 to 8,000,000 in 1919, or a decrease of over 30 per cent. In France the reduction was largely due to the destruction of the mines. The output of lignite in Germany in 1919 was greater than before the war being 94,000,000 as compared with 87,000,000 in 1913, but was less than in 1918. After the dissolution of Austria-Hungary the resources of coal and lignite of which the output was about 55,000,000 tons before the war, passed over to Czecho-Slovakia, whose production in 1919 was about one-third less than the same regions produced in 1913.

It was estimated that the total coal production of the world in 1919 had fallen back to the level of 1910. It showed a considerable decline since 1918, estimated at 162,000,000 metric tons.

In connection with the turning over to the Allies of supplies of coal and the reduction of its coal fields Germany was face to face with many fuel problems during the year, important among which was the question of adequate coal for the operation of the various manufacturing industries. Various solutions were proposed, some of which looked to the nationalization of the mines and mineral industries. Towards the end of the year it appeared that a sort of super-trust system devised by Herr Stinnes, a German capitalist with vast holdings in industrial projects and a man of great political influence and strength, was meeting with very favorable consideration. This plan as advocated by Herr Stinnes and his followers provided for coöperative trusts of related industries, such as coal mines and iron and steel works; controlled by boards in which the consumers would have the majority.

A subcommittee composed of Stinnes and two other mine owners at the end of the year were in conference in Essen, the heart of the western mining district, to consider industrial problems. It was stated that the result of this conference was that the two opposing groups, one favoring government ownership, the other favoring coöperative trusts, had reached the understanding that the most complete and economical utilization of all industrial products in the interest of the whole nation must be secured at all costs.

In the opinion of many this would be best secured by the adoption of Stinnes' plan.

There was advanced, however, as an alternative proposition which was also under discussion, a scheme for socialization of the mining land only, with the mines to remain as before, in private hands. Numerous objections to the proposition were advanced, but being in the nature of a compromise, its adoption was looked upon as a possibility.

PRODUCTION IN 1920. Revised estimates of anthracite production in the United States in 1920 prepared by the United States Geological Survey cover the entire Pennsylvania output, including river anthracite and the product of Sullivan county, and also embrace mine fuel and sales to the local trade. A total output of 89,100,000 tons was indicated for 1920, divided as follows:

January	7,588,000	July	8,261,000
February	6,525,000	August	8,025,000
March	7,857,000	September	4,646,000
April	6,225,000	October	8,069,000
May	7,959,000	November	7,453,000
June	8,171,000	December	8,321,000
Total for year		89,100,000	

COAL INDUSTRY IN 1920. Although the coal strike of 1919 ended in the middle of December of that year its effects were felt throughout the early months of 1920. There was only a fair production of coal in January, February, and March, and not enough to replenish the depleted stocks after the end of Federal control of the railways February 29th. There was improved bituminous production under private operation in March. Production, however, fell to a very low figure in April after the outlaw strikes of the switchmen early in that month, and production continued at a low rate. Matters were made worse by the dislocation of coal cars throughout the country as the result of the heavy western movement of eastern cars during the strike. Car shortage reached a very high figure at the mines. The stocks were estimated on March 1st as amounting to only 24,000,000 tons. The Transportation Act of 1920 enabled the Interstate Commerce Commission to aid in relieving the situation. The law provided that whenever, in the opinion of the Commission, an emergency existed the Commission might authorize a departure from the scheme of transportation. The Commission on learning that such an emergency existed took active steps to remove the difficulty. The following recommendations for the future were proposed by A. G. Gutheim in an address before the American Economic Association, December 28:

"First—The bituminous coal mining industry is developed far beyond the present or immediate future demands of our domestic and foreign trade in bituminous coal.

"Second—Our railroad facilities are probably adequate to-day to handle our necessary annual bituminous output produced with fair uniformity of rate throughout the year, and will certainly be adequate when post-war rehabilitation of the properties is completed.

"Third—Our railroad facilities are not, and without great waste of investment never can be, adequate to handle currently our necessary bituminous coal production when obtained by weekly peaks of 13,000,000 tons and valleys of 7,500,000 tons in a 12-month period, as has been the case these past two years.

"Fourth—While the powers of the Interstate

Commerce Commission are sufficient to force transportation for such extremes of production the exercise of such powers necessarily involves discrimination against other traffic and should be avoided if at all possible.

"Fifth—While our present railroad regulation can force production, it can control distribution but slightly, and prices not at all.

"Sixth—Extreme variation in rates of production not only unduly burdens the transportation machine, but invites further overdevelopment of mining, with the consequence of great irregularity in miners' working time.

"Seventh—So long as regulatory powers exist to force coal production at the expense of other industry, similar power should exist to compel proper distribution of such production should necessity therefor arise.

"Eighth—Provision should be made, by additional legislation if necessary, for the securing and compilation by proper governmental authority, of current and complete statistics of production, distribution, consumption and stocks of bituminous coal.

"To conclude, let it be kept in mind that production, transportation, distribution, and consumption are the four big factors in the bituminous coal industry, and should be reasonably well balanced. Of course, such disturbances as war and nation-wide strikes constitute emergencies which require corresponding treatment. But under ordinary conditions proper coördination of these four big factors is possible and the result should be better conditions of mining and rail-roading, lower costs of production and transportation, and better prices and distribution to the consumer. These are the ends toward which we should aim."

COST OF PRODUCTION IN ENGLAND. In a statement given out in 1920 the Mines Department of Great Britain issued the following summary of the current costs of production of coal:

Costs of production	Per cent disposable commercially	
	s.	d.
Wages	26	3.06
Stores and timber	5	5.64
Other costs (management, salaries, insurances, repairs, offices, selling and general expenses, etc.)	2	6.15
Royalties	0	7.62
Total costs	34	10.47
Deduct proceeds of miners' coal	0	1.72
Net costs	34	8.75

See AGRICULTURE; also GREAT BRITAIN; and WAR OF THE NATIONS.

COAL STRIKES. See STRIKES AND LOCK-OUTS; GREAT BRITAIN and UNITED STATES.

COASTLAND. (*German KUSTENLAND*). A region in the former kingdom of Austria under the Austro-Hungarian monarchy, comprising the crownlands of Istria, Gorz, Gradisca, and Trieste. Area, 3078 square miles; with a population in 1910 of 893,797; estimated 1913 at 938,008. The important seaport Trieste is its largest city, with a population before the war of 246,500, including its territory. Other cities are Pola, a former Austrian naval base, 59,300 and Gorz (Goritz), 32,600.

COATES, ALBERT. See MUSIC, *Orchestras*.

COCHIN-CHINA. The southernmost division of the French colonial possessions of Indo-

China (q.v.); with an area estimated at 20,000 square miles, which is divided into 17 provinces. The total population in 1914 was placed at 3,050,785, of whom 11,251 were Europeans (exclusive of the military). The capital is Saigon which in 1919 was estimated at 64,496. The largest city is Cholon with about 190,085 of whom 97,211 were Chinese. The chief product is rice; of late years the rubber product has become important. Other crops are corn, bananas, oranges, sweet potatoes, and other vegetables, betel-nuts, pepper, tobacco, coffee, and sugar-cane. Stock-raising and fishing are important interests. In 1918, 9018 steamships of 1,086,000 tons entered at the port of Saigon. Total exports in 1918 were, 280,363,349 francs, and imports, 165,071,936. In 1919 the budget balanced at 9,085,358 piastres. The colony is under a resident-governor and a colonial council of 18 members. It is represented by one deputy in the French parliament.

COE COLLEGE. An institution of the higher education at Cedar Rapids, Iowa, founded in 1881. The enrollment of students at the summer session in 1920 was 227 and for the regular fall session, 617. The faculty numbered 36. The productive funds amounted to \$1,000,687, and the income for the year was \$182,000. The library contained 16,000 volumes. President, J. A. Marquis, D.D., LL.D.

COINS, FOREIGN VALUE OF. The estimates of the value of foreign coins for the beginning of 1921 shown on page 157 were issued by the United States Director of the Mint.

COKE. The outstanding features of the coke industry in 1919 were the great slump in demand that followed the armistice and a remarkable increase in the proportion of by-product coke as compared with beehive coke. According to preliminary estimates made by the United States Geological Survey, the total production of coke in 1919, including beehive and by-product but excluding gashouse coke, was 44,821,000 net tons, a decrease, when compared with the production in 1918, of 11,657,000 tons, or 21 per cent. The decrease was confined almost entirely to beehive coke, the production of which fell off 36 per cent. The output of by-product coke decreased only 3 per cent. The output of by-product coke consequently exceeded that of beehive coke for the first time. In 1918 about 46 per cent of the total coke made in the United States was produced in by-product ovens and 54 per cent in beehive ovens. In 1919 the proportions were reversed, 56 per cent coming from by-product and only 44 per cent from beehive ovens. The year 1919 thus marked a turning point in the history of coke manufacture in the United States. The revised total output of beehive coke during 1920 is placed at 20,825,000 net tons.

Preliminary returns made by operators of by-product coke plants indicate that the total output of by-product coke during the calendar year 1920 was approximately 30,680,000 net tons. This was an increase of 5,500,000 tons, or 22 per cent over the output reported in 1919, when 25,143,542 tons were produced. Nearly every State reported a substantial increase in production. More than 850 new ovens were put in operation and 580 more were reported under construction at the close of the year. On the basis of 1919 practice the coal charged to produce the coke recovered would be about 43,800,000 net tons. The total production of all coke in 1920 (excluding gas house coke) was 51,505,000 tons, of which

Country	Legal standard	Monetary unit	Value in terms of U. S. money	Remarks 1
Argentina Republic.	Gold	Peso	\$0.9648	Currency: Paper, convertible at 44 per cent of face value; exchange rate, gold \$0.7725; paper \$0.34.

Switzerland	Gold	Krona	.2680	Exchange rate \$0.1975 = 1 krona.
Turkey	Gold	Franc	.1930	Member Latin Union; gold is actual standard. Exchange value \$0.152.
Uruguay	Gold	Piaster	.0440	(100 piasters equal to the Turkish L.) Exchange rate about \$0.70 = 1 Turkish L.
Venezuela	Gold	Peso	1.0342	Exchange rate \$0.752.
		Bolivar	.1930	Exchange rate about \$0.175.

1 The exchange rates shown under this heading are recent New York quotations and are given merely as an indication of the values of currencies which are fluctuating in their relation to legal standards.

40.4 per cent was made in beehive ovens and 59.6 per cent in by-product ovens.

COLBY, BAINBRIDGE. New York lawyer, appointed Secretary of State February 25th. He was born at St. Louis, Dec. 22, 1869; graduated at Williams College in 1890 and studied at the Columbia Law School, New York City, and practised in New York City after 1892, appearing in a number of celebrated cases including the settlement of the affairs of the Mark Twain publishing house and several important insurance cases. He was a member of the New York Assembly 1901-1902, and became a thoroughgoing supporter of Theodore Roosevelt. At the time of the latter's candidacy for the Presidential nomination in 1912 he had charge of the contests to seat Roosevelt delegates in the Republican National Convention and later he was delegate to the Progressive National Convention (1912). He was nominee for United States Senator on the Progressive ticket in 1914 and 1916. After the nomination of Hughes he refused to follow Roosevelt and went over to the support of President Wilson whose policies he defended in a number of very effective speeches. In 1917 he was appointed commissioner of the United States Shipping Board and became a member of the United States Shipping Board Emergency Fleet Corporation. At the Inter-Allied Conference at Paris in 1917 he was a member of the American mission and he was present at Paris also during the sessions of the Peace Conference. His appointment as Secretary of State was criticized in the press and in political circles generally on the ground that Mr. Colby had shown himself unstable in his political views. In general he had followed the lines that seemed at the time moderately progressive and his changes may be attributed chiefly to that tendency. He has been a witty and effective speaker and inclined in his public addresses to impromptu and somewhat extreme remarks that have been used against him subsequently by his opponents. An instance of this was his emphatic endorsement of the Sinn Fein movement.

COLERIDGE, ERNEST HASTLEY. British author, died, February 19. He was born Dec. 8, 1846, and educated at Balliol College, Oxford, where he was a tutor from 1872 to 1893. He edited the letters of Samuel Taylor Coleridge and selections from his unpublished notebooks; *Life and Correspondence of John Duke, Lord Coleridge* (1904), and the *Poetical Works of Lord Byron*. in seven volumes, (1898-1903).

COLGATE UNIVERSITY. A non-sectarian institution of higher learning at Hamilton, N. Y., founded in 1819. The enrollment for the fall of 1920 was 692 and the members of the faculty numbered 41. The income from endowment and student fees was \$243,694. The library contained 90,567 bound volumes, and 125,000 pamphlets. President, Elmer Burritt Bryan, LL. D., L. H. D.

COLLEGES, AGRICULTURAL. See AGRICULTURAL EDUCATION.

COLLINGS, JESSE. British publicist, died at Birmingham, England, November 20. Throughout his career he devoted himself to a crusade for the creation of a peasant proprietary and was known as the pioneer of small holdings. He was born in Devonshire, in December, 1831, in humble circumstances, but he succeeded at the

age of thirty-three in becoming a successful merchant in Birmingham, of which city he became mayor at the age of forty-seven. In 1880, he was elected to Parliament and carried through a bill for the extension of allotments. In 1886, he brought in a motion in favor of small holdings that resulted in the overthrow of the Conservative ministry. He founded the Allotment and Small Holdings Association and gave himself to the cause with great devotion. To him was attributed the party cry of "Three acres and a cow." He was made Privy Councillor in 1892. He was member of Parliament from 1886 until his retirement in 1918.

COLLINS, GILBERT. Jurist, died in Jersey City, N. J., January 29. He was born at Stonington, Conn., Aug. 26, 1846, and admitted to the bar in Jersey City in 1875. In 1884-6 he was mayor of that city and from 1897-1903 justice of the supreme court of Jersey City. In politics he was a Republican.

COLLISSON, WILLIAM ALEXANDER HOUSTON. British clergyman, died February 1. He was born at Dublin, Ireland, May 20, 1865, and educated at Trinity College, Dublin, where he studied music. He organized a series of popular concerts at Dublin and afterwards at Belfast and London. He was ordained in 1898 and after holding many charges became pastor of All Saints at Twickenham in 1912. His compositions include a variety of comedy operas, cantatas and songs, and he wrote *Dr. Collisson in and on Ireland*.

COLMAN, SAMUEL. Painter, died March 27. He was born at Portland, Me., March 4, 1832, and studied painting in New York City and in European countries. Among his principal pictures are the "Ships of the Western Plains," "Moonrise in Venice," "Spanish Peaks, Colorado," and the "Mosque of Side-bou Hac." The last two were placed in the Metropolitan Museum of Art and in the New York Public Library.

COLOMBIA. A republic of South America, situated in the northwestern part of the continent. Capital, Bogota.

AREA AND POPULATION. Owing to boundary disputes with other countries the estimates of area vary. A provisional estimate made after the boundary agreement with Ecuador in 1917 placed it at 435,000 square miles; the estimate at the census of 1912 was 440,846 square miles which corresponds closely to more recent estimates. The independence of Panama was recognized by the Colombian government in the treaty with the United States signed, April 6, 1914, in return for the sum of \$25,000,000 and the reservation of certain rights in the Canal Zone. According to the census of 1912, the total population was 5,071,101 and the average density per square mile was 11.5. There are 14 departments, seven commissaries and two intendancies. The above figures for population do not include about 30,000 uncivilized Indians. The capital, Bogota, had a population in 1912 of 139,277. The chief commercial towns with their populations are as follows: Barranquilla, 64,554; Manizales, 34,720; Medellin, 47,354; Cartagena, 36,632; Cali, 27,747; Bucaramanga, 19,735; Cucuta, 20,364. Barranquilla is an important port of shipment being connected with the coast by a railway 17 miles in length; Medellin is a mining centre; and Bucaramanga and Cucuta are both important coffee centres.

EDUCATION AND RELIGION. Instruction is free, but not compulsory. According to the reports in 1920 there were 4422 primary schools with an attendance of 333,658 pupils. In 1917 there were 384 secondary and professional schools with 33,115 pupils and 98 art and trade schools with 7044. There are two normal schools in each department, with the exception of Santander which has three and Huila which has none. The professional schools include an agricultural school, law school, medical school, and schools of engineering, etc. There are also night schools for workingmen in Bogota and other cities. In 1919 the expenditures for public instruction amounted to 1,096,810 pesos. There is a university at Bogota, one of the oldest on the continent, having been founded in 1572. The other universities are under the control of the departments. They are situated at Medellin, Cartagena, Popayan and Paato. At Medellin there is also a well-known school of mines which is under national control.

PRODUCTION, ETC. The staple product is coffee; of late years the cotton industry has been increasing in importance. Tobacco also is grown. Wheat is grown on the Bogota plateau to supply the flour mills in and near that city. The cattle industry was flourishing in the years following the war and new grazing lands were developed in various parts of the country. The principal cattle regions of Colombia at present are the Magdalena, Cauca, and Sinu River Valleys. There are immense tracts of land in the southeast part of the country capable of development for this industry, but they are impracticable at present on account of lack of transportation facilities. The various placer and quartz gold mines were active during the year 1918, but mining costs were augmented considerably by the difficulty of obtaining skilled workmen, the high cost of machinery and supplies, and the increasing cost of local labor. The actual value of the gold produced was slightly over \$6,000,000. The drilling for petroleum was carried on exclusively by a single American corporation in 1918, but there were several which carried out active exploration work and were quietly engaged in preparing for active operations as soon as the relaxation of commerce restrictions should make it possible to bring equipment from the United States. In the meantime American and other foreign oil interests had been actively leasing the petroleum rights on the best privately owned lands having clear titles, and geologists had been carefully studying and mapping those sections of the country showing indications of oil.

The petroleum industry has grown to become of great prospective importance.

The restrictions placed upon exports by the belligerent powers cause a brisk demand for all Colombian manufactured products, but many manufacturers, for the same reason, encountered great difficulty in obtaining raw materials, especially in the match, soap, and ice industries. There was a considerable rise in prices of these articles, but the removal of restrictions caused a slight decline, though not, by any means, to previous levels. While Colombia is far from being an industrial country, its manufacturing plants are increasing in number each year and their products are improving in quality. The three principal manufacturing centres are Bogota, Barranquilla, and Medellin, and the lead-

ing products are (in the order of their importance): Cotton textiles, shoes, cigarettes and cigars, beer, flour, chocolate, soap, and matches. Straw hats (so-called Panama hats) are also largely manufactured in the interior.

The foreign trade of Colombia for 1918 resulted in a favorable trade balance of around \$10,000,000 (practically all in credits in New York), though both imports and exports were below normal, in tonnage if not in values. As nearly as can be approximated from the data available the total exports were about \$32,000,000 as against imports of \$22,000,000. The chief export is coffee. In 1918 from the port of Barranquilla were shipped 82,500,000 pounds valued at \$11,700,000 to the United States alone, being about 78 per cent of the total exports to the United States. The chief imports in 1918 were dry goods, drills and sheetings, machinery, hardware, builders' hardware, iron sheets, rods and wire, paper, cement, resin, paints and oils, caustic soda, medicines, automobiles, office fixtures and appliances, and wines and liquors. Foodstuffs were in demand, but receipts were below normal on account of the above mentioned conditions.

FINANCE. The Colombia peso, worth 97 cents at par, rose for the first time to a premium over the American dollar in 1918, owing to the increasingly favorable trade balance of Colombia with the United States and the prohibition of gold exports to the United States. The budget estimates for 1920 were: Revenue, 23,855,253 pesos; expenditures, 27,792,581 pesos. The main source of revenue in 1920 was the customs and the next to that was the salt tax. The leading items of expenditures in 1920 were the department of the interior and the national debt service. The consolidated debt in 1920 amounted to 2,848,260 pesos, and the floating debt to 10,840,654 pesos.

COMMUNICATIONS. In 1918 the railways had a total mileage of 740. There were 22,000 kilometers of telegraph lines in 1920. In 1917 the vessels entered at Cartagena numbered 234 with a tonnage of 413,174; of these 113 were American and 36 were British.

DEFENSE. There is compulsory military service for a year or year and a half. The army consists of 12 infantry regiments which form three divisions, and of a cavalry regiment, an artillery section, an engineering battalion, and a transport battalion. The peace strength is placed at about 6000 and the war strength at 55,000.

GOVERNMENT. The executive power is vested in the president, elected by direct vote for four years and not eligible for two consecutive terms, and in a responsible ministry consisting of the following departments: Interior, foreign affairs, finance, treasury, war, public instruction, commerce and agriculture, and public works. The legislative authority resides in a congress of two houses, the Senate and the House of Representatives. The Senate has 34 members elected indirectly for four years and the House 92 members elected by the people for two years. The president at the beginning of 1920 was Señor Marco Fidel Suarez.

COLLISIONS. See RAILWAY ACCIDENTS.

COLORADO. **POPULATION.** According to the preliminary report of the census of 1920, there were 939,629 residents in the State, Jan. 1, 1920, as compared with 799,024 in 1910.

AGRICULTURE. According to the census of 1920, the number of farms was 59,991, an in-

crease of 29.9 per cent since 1910. The following table is compiled from the estimates of the United States Department of Agriculture, covering the years 1919 and 1920:

Crop	Year	Acreage	Prod., bu.	Value
Corn	1920	843,000	17,450,000	\$12,215,000
	1919	704,000	11,757,000	16,695,000
Oats	1920	255,000	8,058,000	4,835,000
	1919	249,000	6,524,000	5,872,000
Wheat	1920	1,240,000	22,821,000	80,808,000
	1919	1,388,000	16,615,000	38,582,000
Barley	1920	190,000	4,674,000	3,506,000
	1919	171,000	3,334,000	4,001,000
Rye	1920	115,000	1,357,000	1,425,000
	1919	135,000	1,188,000	1,544,000
Broom corn	1920	7,000	* 1,800	91,000
	1919	14,000	* 2,400	240,000
Hay	1920	1,608,000	* 3,392,000	41,556,000
	1919	1,560,000	* 3,060,000	56,574,000
Beans	1920	63,000	504,000	1,588,000
	1919	69,000	448,000	1,568,000
Potatoes	1920	78,000	10,920,000	8,786,000
	1919	92,000	11,040,000	18,768,000
Gr. sorghums	1920	255,000	4,335,000	3,641,000
	1919	300,000	4,350,000	5,220,000

* Tons. * Bales.

MINERAL PRODUCTION. The estimates of the United States Geological Survey of mineral production in 1919 and 1920 were as follows:

Gold, dollars	Silver, ounces	Copper, pounds	Lead, pounds	Zinc, pounds
7,613,400	5,572,407	3,600,000	44,600,000	42,000,000
9,867,927	5,639,516	3,310,675	35,859,090	51,445,429

The increase in the output of lead and copper and the maintenance of the zinc production to 80 per cent of that in 1919 can be attributed in part to the fact that the Sunnyside Company's new 500-ton concentration-flotation mill at Eureka, San Juan County, began operations early in 1920 and continued operations steadily throughout the year, producing both lead and zinc concentrate. The three lead-smelting plants at Pueblo, Durango, and Leadville, were operated steadily on ores from Colorado and Idaho and zinc residues from Oklahoma and at a slightly increased capacity over that of the closing days of 1919. The Salida smelter was closed in February but had not been in the market for ores for several months before that date. The zinc oxide plant at Leadville continued operations on low-grade zinc carbonate ores. As a result of reorganization assuring a steady supply of zinc carbonate ores from the Downtown mines, a new block of furnaces was completed in August, but the new block was not placed in operation because of the waning market for zinc oxide. The Ohio zinc oxide plant at Canon City was operated until early in December on zinc carbonate ores from Leadville and from camps in Utah and Nevada. The Empire Zinc Company constructed and set in operation as a trial a very modern zinc oxide plant at Canon City, where is situated also that company's magnetic separation plant, which has been successfully operated for many years on Leadville zinc sulphide ores. The River Smelting and Refining Company's plant at Florence for the treatment of low-grade copper-lead-zinc ores by the matting and fuming process was operated until December. The Cripple Creek gold district, in Teller County, labored under the difficulties of high costs and the unchanging value of gold but produced \$4,500,000 as compared with \$5,796,713 in 1919. Mining at Leadville, where a variety of metals are produced was at a low ebb at the end of 1919, but ore shipments increased during 1920 and four furnaces were operated at the smelter for the greater part of the year. Pyritic ore carrying some gold and several ounces of

silver to the ton was shipped in considerable quantity to the General Chemical Company's sulphuric acid plant at Denver. Lead-zinc sulphide ore was shipped to zinc retort plants and to zinc oxide plants. Some manganese ore also found a market. The Derry Ranch dredge, below Leadville, resumed operations in May after the usual enforced idleness during the winter and was successfully operated until December.

EDUCATION. According to the *Colorado Year Book* of 1920, the schools of the State numbered 3057 with 7279 teachers, and the salaries of teachers ranged from an average of \$68.40 a month in one-teacher schools to \$106.45 a month in high schools. The total enrollment in public schools was 191,199. The institutions of higher learning supported by the State are: University of Colorado, Boulder; State Teacher's College, Greeley; State Normal School, Gunnison; and State Agricultural College, Fort Collins; School for the Deaf and the Blind, Colorado Springs.

CHARITIES AND CORRECTIONS. According to the State board of charities in 1920 the institutions of the State were as follows: State Industrial School for girls, Morrison; State Reformatory, Buena Vista; State Home for Dependent and Neglected Children, Denver; State Home and Training School for Mental Defectives, Ridge and Grand Junction; State Industrial School for Boys, Golden; State Penitentiary, Canon City; State Hospital (Insane Asylum), Pueblo; Soldier's and Sailor's Home, Monte Vista; Industrial Workshop for the Blind, Denver.

ELECTIONS. The vote in the presidential election of 1920 was as follows: Harding (Republican), 173,248; Cox (Democrat), 104,936; Debs (Socialist), 8046; Christensen (Farmer-Labor), 3016; Watkins (Prohibitionist), 2807; as compared with the following vote in the presidential election of 1916: Wilson (Democrat), 178,816; Hughes (Republican), 102,308; Benson (Socialist), 10,049; Hanly (Prohibitionist), 2793. The vote for governor in 1920 was: Shoup (Republican), 174,456; Collins (Democrat), 108,694; and the vote for United States Senator: Nicholson (Republican), 156,577; Scott (Democrat), 112,890; Stevens (Farmer-Labor), 9041; Thomas (Independent), 8665.

OFFICERS. Governor, Oliver H. Shoup; Lieutenant-Governor, George Stephan; Secretary of State, James R. Noland; Treasurer, E. Mulnix; Auditor, Arthur M. Strong; Attorney-General, Victor Keyes; Superintendent of Public Instruction, Mary C. C. Bradford.

COLORADO, UNIVERSITY OF. A co-educational State institution of the higher education, at Boulder, Col., founded in 1876. The enrollment for the summer session of 1920 was 1730, and for the fall session, 2169. The faculty numbered 264, of whom 23 were added in the course of the year. The library contained 116,000 volumes. In 1920 a new Liberal Arts building was in process of construction at a cost of \$400,000 and the Macky Auditorium was being completed, at a cost of \$110,000. The General Education Board of the Rockefeller Foundation offered \$700,000 toward the construction of a medical plant and \$50,000 a year toward its maintenance for a period of years, provided that the State made up the balance, which was estimated at \$1,500,000. President, George Norlin, Ph.D.

COLORADO METHODISTS. See **METHODISTS, COLORADO.**

COLUMBIA UNIVERSITY. A non-sectarian institution of learning, whose principal buildings are at Morningside Heights, New York City. It consists of Columbia College, the undergraduate college of Liberal Arts, whose courses of study lead to the degree of Bachelor of Arts; the School of Law conferring the degree of Bachelor and Master of Laws; the College of Physicians and Surgeons, whose courses lead to the degrees of Bachelor of Science and Doctor of Medicine; the Schools of Mines, Engineering and Chemistry, which confer the several engineering degrees and the degree of Master of Science; the School of Architecture, conferring the degrees of Bachelor of Literature and Master of Science; the School of Business recently opened conferring the degrees of Bachelor and Master of Science; the School of Dentistry, conferring the degrees of Bachelor of Science and Doctor of Dental Surgery; the non-professional graduate faculties of Political Science, Philosophy, and Pure Science, whose courses lead to the degrees of Master of Arts, and Doctor of Philosophy; Barnard College, an undergraduate college for women, whose courses lead to the degree of Bachelor of Arts; Teachers College, including the faculties of education and practical arts, with courses leading to the degrees of Bachelor of Science, Master of Arts, and Master of Science; and the New York College of Pharmacy, conferring the degrees of Pharmaceutical Chemist, Bachelor of Science, and Doctor of Pharmacy. There is also a numerously attended summer school which begins immediately after July 4, and there is a thorough system of extension teaching. At Morningside Heights are situated Columbia College, the library, the schools of Mines, Law, Architecture, and other departments of the university proper, Barnard College, and Teachers College. The medical school or College of Physicians and Surgeons, is on West 59th Street and the College of Pharmacy on West 68th Street. The university conducts a summer camp at Morris, Conn., the site having an area of 585 acres. The total number of students receiving instruction from the university in the fall of 1920 was 23,793 (allowing for duplicates). Of the number registered 2456 were undergraduates (Columbia College, 1752; Barnard College, 704); 6157 graduate and professional students; and 9004 students in extension. In 1920 the summer school students numbered 9780. The attendance at specific schools was distributed as follows in 1920: Graduate faculties, 1121; Law, 543; Medicine, 387; Business, 311; Journalism, 130; Mines, Engineering and Chemistry, 182; Pharmacy, 519; Teachers College, education, 1535; Teachers College, practical arts, 1219. The teaching force numbered 1504. The productive funds in 1920 were \$34,473,304 and the total of gifts was \$2,305,081.

During 1920 the institution lost by death, Alfred J. Moses, Professor of Mineralogy; Francis Sedgwick Bangs, trustee of the university since 1906, Willard T. Barbour, Carpenter Lecturer on English legal history; Frederick B. Jennings, trustee of Barnard College since 1900; Francis M. Burdick Dwight, Professor Emeritus of Law; Miss F. Tallman, Assistant Professor of Religious Education in Teacher's College; Albert H. Stevenson, Professor of Preventive Dentistry; George M. Lefferts, Professor Emer-

itus of Laryngology; Luther Herbert Alexander, Instructor in Romance Languages and Literature in Barnard College. The largest single gift during the year was that from the estate of the late Joseph R. DeLamar for the creation of the DeLamar fund for the benefit of the school of medicine. Among other gifts may be mentioned, Cragin endowment fund, \$56,482; will of Sarah E. Mower, \$53,809; Hugo estate, \$21,037; Borden's Condensed Milk Company, \$16,000; Phoenix estate, \$12,125; Clarence H. Mackay for surgical research, \$12,000; John S. Kennedy estate, \$10,572; T. M. Cheesman estate, \$10,000; Gerard Beekman estate, \$10,000; General Horace W. Carpentier estate, \$20,710; alumni fund committee for deficiency in cost of maintenance, \$69,804.

The library contained 471,000 volumes. Arrangements were made in the spring for the preparation and publication through the Columbia University press of the complete works of John Milton under the editorship of members of the department of English and Comparative Literature. Preparations were being made for the erection of the new building for the school of business which was to be on the corner of Broadway and 116th Street. The resources of Barnard College were largely increased during the year and its budget appropriations for the year ending June 30, 1920, were about \$480,000 and its property was valued at \$6,250,000. Teachers College has also grown rapidly in recent years. Its property was valued at \$8,150,000 and the budget appropriations for the year ending June 30, 1920, were about \$1,690,000. President, Nicholas Murray Butler, LL.D.

COMMISSION-MANAGER. See **MUNICIPAL GOVERNMENT**.

COMMISSION PLAN. See **MUNICIPAL GOVERNMENT**.

COMMUNITY MUSIC. See **MUSIC, General News**.

COMMUNITY SERVICE. This organization is the outgrowth of the War Camp Community Service, and its object is, through non-sectarian and non-partisan channels, to provide healthy recreation for communities, and especially where those communities are industrial. With the giving of more leisure time to the workman and the passing of the saloon, new interests are necessary for the workman, in order to avoid this feeling of "unrest" that has been passing over the country since the war. During the year Community Service sent trained organizers into many communities, first to study the situation and see what was needed, and then organize the community to the filling of those needs. Both capital and labor have supported this effort. Social gatherings for purposes of entertainment and lecture, besides the organization of many sports has been the result. National headquarters of Community Service are maintained at 1 Madison Ave., New York City.

CONGO, BELGIAN. A colony of Central Africa belonging to Belgium; formerly the Congo

Free State founded in 1885 by Leopold II, king of the Belgians, but since 1908 annexed to Belgium and directly under the Belgian government. Area and population estimates vary. Area, from 909,654 square miles to 913,127 square miles. Population, from 9,000,000 to 15,500,000, the latter being the estimate of Sir H. Johnstone. The prevailing element in the native population is the Bantu stock, estimated at 7,000,000. At the beginning of 1919 the European population was placed at 3831 of whom 2340 were Belgians. The leading cities are Boma, the capital, Matadi, Banana, Leopoldville, Stanley Pool, Elizabethville, Kambove, Bandundu, and Niangara.

PRODUCTS. The chief products are rubber, palm-nuts and palm-oil, white copal and cocoa. Coffee is grown successfully and there is an abundance of ivory. In the native villages, rice, cotton and tobacco are largely grown. Cattle-raising flourishes in the regions that are not infested by the tsetse fly, and mining is carried on, the chief mineral products worked being gold, diamonds and copper. Coal, iron, tin, and manganese are also found. In 1918 about 8000 natives were employed in the gold mines. There are important copper mines near Kambove.

COMMERCE. Total imports in general trade in 1918 amounted to £2,014,301 and in special trade £1,504,190. According to the Board of Trade returns the imports into Great Britain from Belgian Congo in 1919 amounted to £878,235 and the exports from Great Britain to Belgian Congo amounted to £1,226,130. Of the special imports in 1918, the share of the United States was valued at 501,404 francs.

COMMUNICATIONS. The Congo is navigable for nearly 100 miles above its mouth, that is, to Matadi, and there are fifteen government steamers in this section. It becomes navigable again above Stanley Pool for a distance of nearly 1600 miles, that is as far as Stanley Falls. Its tributaries are also navigable for a considerable distance. The railway mileage on Jan. 1, 1920, was 1250, the longest lines being those from Bukama by way of Elizabethville to the frontier of Rhodesia (456 miles), the Kindu-Kongolo line (327 miles), and the Matadi-Leopoldville line (248 miles). Within the Congo railway system are included two sections of the Cape-to-Cairo railway. The distance to Cape Town from Elizabethville on the Cape-to-Cairo railway is estimated at 2300 miles. In 1918 the post offices numbered 49 and the telegraph lines had a mileage of 2065.

GOVERNMENT. The colony is under a minister appointed by the king and a colonial council of which he is president and which consists of 15 members of whom nine are appointed by the king. The colony is governed locally by a governor-general, aided by several vice-governors-general. The governor-general at the beginning of 1920 was M. Henry.

CONGO FREE STATE. See CONGO, BELGIAN.

CONGO, FRENCH. See FRENCH EQUATORIAL AFRICA.

CONGREGATIONALISM. Statistics to Jan. 1, 1920 show that this denomination has in the United States, 5959 churches, 713 home missionary churches, 808,122 members, 728,619 Sunday school pupils, 1460 men's organizations, with 86,897 members, 2693 young people's societies, with 104,388 members. Statistics for the number of churches and members of the denomination

show a loss as compared with those of Jan. 1, 1919, but among the Sunday schools and other organizations there is a marked increase. Total benevolent contributions for 1919 amounted to \$3,756,986, a marked increase over 1918, while home expenditures for the year amounted to \$12,195,872. The Congregational national missionary societies are as follows: the American Board of Commissioners for Foreign Missions, the Congregational Home Missionary Society, the American Missionary Association, the Congregational Educational Society, the Congregational Church Building Society, the Congregational Sunday School Extension Society, and the Congregational Board of Ministerial Relief. The women are represented by the Woman's Home Missionary Federation and three (regional) woman's boards of missions. The American Board of Commissioners had in 1919, through its 22 missions, 114 stations and 1630 outstations in Africa, Balkans, Turkey, Ceylon, China, Japan, Mexico, Spain, Czechoslovakia, and among the Philippines. Receipts for this work were \$1,580,530. Missionaries numbered 703, and native laborers 5858, serving 86,886 communicants, and through 1138 Sunday schools, teaching 61,877 pupils. Native contributions amounted to \$470,667. The American Missionary Society maintains 194 churches, with 13,980 members and 53 schools with 12,096 pupils. Total receipts were \$779,700.28. The American Home Missionary Society carried on its work in 28 states and territories employing 1502 missionaries and caring for 1973 churches and stations. Of these churches 359 held services in a foreign language. Twenty-two languages were represented. Total receipts for the year amounted to \$695,365.47. The Congregational Church Building Society received during the year some \$431,749 from which loans were made to many churches for building purposes. The Congregational Board of Ministerial Relief paid in pensions \$101,705.66 during the year, while receipts totaled \$226,876.66. The Woman's Board of Missions employed 133 missionaries, besides 650 native teachers. It conducts 34 boarding schools for girls, its educational work includes normal and kindergarten training schools and more than 300 elementary schools. Receipts for the year totaled \$287,321. The denomination assists in the maintenance of nine theological seminaries, the principal, over which the church has direct control, is the Hartford Theological Seminary. The denomination also assists in the maintenance of 40 colleges throughout the United States.

The financial drives inaugurated in 1918 and 1919 have progressed well. The Five Year Tercentenary Campaign for seven million dollars the first year and two million dollars a year after that, worked out successfully. It is now planned to raise fifty million dollars to carry on missionary and educational work. The general administration of the church is under the control of the national council with headquarters at 289 Fourth Ave., New York City. The officers of this council for 1919-1921 are: Moderator, Rev. Henry C. King; assistant moderators, Rev. Robert A. Hume and Rev. W. N. de Berry; secretary, Rev. Hubert C. Herring; treasurer, Rev. Frank F. Moore.

Figures from foreign countries, some of which are of 1917 and others of 1919, show that in England, Wales, Scotland, Ireland, and the Chan-

nel Islands, there were 4992 Congregational churches, chapels and stations with a membership of 492,968; in Canada there were 159 churches, etc., with a membership of 13,315; in Japan there were 138 churches, etc., with a membership of 18,383; in Australia there were 489 churches, etc., with a membership of 21,772, and in South Africa there were 290 churches, etc., with a membership of 20,920 persons.

CONGREGATIONAL METHODISTS. This denomination was originally a part of the Methodist Church, South, but in 1852 a group of ministers in Georgia decided that certain features of the episcopacy and itineracy of that church were objectionable, and broke off relations. The new church was then organized. The objections were governmental and not doctrinal, so that the Methodist doctrines were strictly adhered to, while the government became that of the Congregational Church. The movement spread rapidly for a number of years, so that churches were organized in all the Southern States, and most of the Northern. But in 1887 a large number of members transferred to the Congregational Church, and since that time more and more have left the denomination. Since 1906 more than 25 per cent of the members have been lost, so that at present it looks as though the final result would be dissolution. Some missionary work has been carried on in India, while churches in the United States have been assisted financially. The latest available statistics are for 1919 which show that the denomination had 196 churches, with 220 ministers, and 10,969 church members and probationers. There were 182 Sunday schools, with 1146 officers and teachers, and 8785 pupils. The only periodical is the *Messenger*, published semi-monthly at Ellisville, Miss.

CONGRESS. See UNITED STATES; also LABOR LEGISLATION.

CONNECTICUT. POPULATION. According to the preliminary report of the census of 1920, there were 1,380,631 residents in the State, Jan. 1, 1920, as compared with 1,114,756 in 1910.

AGRICULTURE. According to the census of 1920, the number of farms was 22,655, a falling off of 15.5 per cent since 1910. The following table is compiled from the estimates of the United States Department of Agriculture, covering the year 1919 and 1920:

Crop	Year	Acreage	Prod., bu.	Value
Corn	1920	44,000	1,804,000	\$2,526,000
	1919	50,000	2,900,000	5,220,000
Buckwheat	1920	5,000	85,000	136,000
	1919	4,000	80,000	160,000
Oats	1920	24,000	744,000	558,000
	1919	25,000	775,000	682,000
Rye	1920	7,000	140,000	244,000
	1919	11,000	220,000	440,000
Tobacco	1920	24,400	*36,112,000	12,639,000
	1919	25,000	*39,000,000	18,057,000
Hay	1920	868,000	*475,000	14,120,000
	1919	860,000	*534,000	14,168,000
Potatoes	1920	24,000	2,760,000	4,140,000
	1919	25,000	1,750,000	3,412,000

* Pounds. • Bales.

TRANSPORTATION. The railways of the State are as follows: Hartford and Connecticut Western; New London Northern; New York, New Haven, and Hartford (New York to Springfield, and Boston, Mass.); Norwich and Worcester (operated by the New York, New Haven, and Hartford); and South Manchester. The railway mileage in 1918 was 999.

FINANCE. The latest figures for finance, as supplied by the *State Register and Manual* for 1920, were: Receipts for the fiscal year ending June 30, 1919 (9 months), \$8,014,484; expenditures, \$10,450,605; sinking fund, \$8,332,255. The total indebtedness of the State was \$11,791,100.

CHARITIES AND CORRECTIONS. The State institutions of charities and corrections are as follows: Fitch's Home for Soldiers and Soldiers' Hospital, Noroton Heights; State Hospital, Middletown; State Hospital, Norwich; Farm for Inebriates, Norwich; State Prison, Wethersfield; School for Boys, Meriden; Industrial School for Girls, Middletown; State Reformatory, Cheshire; Training School and Hospital, Mansfield; State Tuberculosis Sanitariums at Hartford, Meriden, Norwich, Shelton, and Niantic.

ELECTIONS. The vote in the presidential election of 1920 was as follows: Harding (Republican), 229,238; Cox (Democrat), 120,721; Debs (Socialist), 10,335; Christensen (Farmer-Labor), 1947; Cox (Socialist-Labor), 1491; as compared with the following vote for president in the election for 1916: Hughes (Republican), 106,514; Wilson (Democrat), 99,786; Benson (Socialist), 5179; Hanly (Prohibitionist), 1789; Reimer (Socialist-Labor), 606. The vote for governor in 1920 was as follows: Lake (Republican), 230,792; Tyler (Democrat), 119,912; Peach (Socialist), 10,154; Krone (Farmer-Labor), 1896; Pryor (Socialist-Labor), 1517; and the vote for Senator: Brandegee (Republican), 216,792; Lonergan (Democrat), 131,824.

OFFICERS. Governor, Marcus H. Holcomb; Secretary of State, Frederick L. Perry; Treasurer, G. Harold Gilpatric; Comptroller, Morris C. Webster; Attorney-General, Frank E. Healy; Adjutant-General, George M. Cole.

JUDICIARY. Supreme Court of Errors: Chief Justice, George W. Wheeler; Associated Justices, John K. Beach, Edwin B. Gager, William S. Case, Howard J. Curtis.

CONSUMPTION. See TUBERCULOSIS.

CONTINUATION SCHOOLS. See EDUCATION IN THE UNITED STATES.

COOKE, MAEJORIE BENTON. Author, died April 26. She was born at Richmond, Ind., and began writing for the magazines at an early age. She also won success for her monologues which she delivered throughout the country after 1902. She was the author of *Modern Monologues* (1903); *Plays for Children* (1905); *The Girl Who Lived in the West* (1910); *Cinderella Jane* (1906); *The Cricket* (1918); three one-act plays by her were produced on the stage.

COOLIDGE, CALVIN. Vice-President elect; in 1920 Governor of Massachusetts. He was born at Plymouth, Vt., July 4, 1872; graduated at Amherst College, Massachusetts and studied law at Northampton, Mass., beginning practice there in 1897. He held the offices of councilman (1892), city solicitor (1900-1), city clerk (1904) in that city, and was the chairman of the city Republican commission in 1904. In 1910-11, he was mayor of Northampton, having meanwhile served as member of the general court for a year (1907-08). In 1912-15, he was a member of the State Senate, of which he was president during the latter part of the period. He was lieutenant-governor from 1916-18 and was elected governor for two terms, 1919 and 1920.

COOLIDGE, THOMAS JEFFERSON. Former United States minister to France, died at Boston, November 17. He was born at Boston, Aug. 20, 1831; graduated at Harvard, 1850, and began business in an important firm of East India merchants. He was afterwards president of several railway and other companies, and was a member of the Pan-American Congress in 1889, minister to France, 1892-3 and a member of the joint high commission to settle disputes between Great Britain and the United States in 1898-9.

COOLIDGE PRIZE. See **MUSIC, Chamber-Music.**

COOPER, EMMA LAMPERT. Artist, died in New York City, July 30. She graduated at Wells College at Aurora, N. Y., and studied art in New York City and in Paris and in other cities of Europe. She was the recipient of many medals and a prominent member of various art associations. Her chief subjects are street-scenes, landscapes, and interiors. She particularly excelled in water color.

COOPERATION. The Coöperative Movement, the "democratic association of men and women consumers, organized for the purpose of supplying their own economic needs" is rapidly becoming in the United States, as it already is in Europe, an important phase of the movement toward industrial democracy. Its principles of democratic control, fixed return on capital, the division of profits in proportion to patronage and not in proportion to money invested, and open membership are in substance the principles of industrial democracy. The movement began with the coöperative retail distribution of the necessities of life—bread, groceries, milk, clothing—but it very shortly developed to include many other enterprises—restaurants, canneries, housing societies, insurance societies, schools—and took over the wholesale as well as the retail distribution of products. Coöperative banks and credit unions, recreational organizations, motion picture shows, and opera houses have been developed in various parts of the world, and it is now estimated that there exist over 120,000 coöperative organizations including several hundred million consumers. In Europe one-third of the population is embraced in coöperative societies. Coöperators have found, however, that full opportunities for free development can be reached only when they control the sources of supplies, and there has accordingly developed a further extension of coöperation to include the production of those articles required by the consumers. The possibilities of coöperative production are perhaps best demonstrated by the activities of the British Coöperative Wholesale Society, which raises wheat on its own land in Canada, transports it in its own ships, and manufactures flour in its own flour mills. It also manufactures many other things, including clothing, shoes, paints, cutlery, lard, bacon, and cocoa.

The movement is largely made up of working people, and, in accordance with its principles, is entirely managed by them. It is everywhere closely allied with the labor movement. Where coöperation is practiced on a large scale, it affords some interesting lights on the problems of adjustment between employer and employee, since under coöperation the members of societies, who are for the most part employees, become also employers of labor. For a discussion of the position of labor under coöperation, see Leonard Woolf, *Coöperation and the Future of Industry.*

Coöperation is based on the fundamental theory that the present competitive system of distribution, with its motive of profit, is wrong. Coöperators believe in the management of the processes of production, manufacture, and distribution by the people. Unlike some of the other advocates of democratic control of industry, they believe in management by the people as consumers, rather than by the people as workers. It is not the fact that a man works in a certain factory that gives him the right to know how it is managed and to regulate the disposition of its profits, according to their view, but the fact that he uses the products of that factory. They envisage the development of coöperation to include not only trade but industry, finance, and agriculture as a part of the function of distributive societies, and thus to bring about the "Coöperative Republic," which, they believe, "will lead to the solution of the social question." For the consumers' organizations, their development, and activities in various countries, see **INTERNATIONAL COöPERATIVE ALLIANCE.** See also **AGRICULTURAL EXTENSION WORK.**

COURLAND. Formerly one of the Baltic provinces of European Russia; after the war a part of the state of Latvia. It lies to the north of the Russian province of Kovno and is situated on the Baltic Sea and the Gulf of Riga; area 10,435 square miles; population, estimated Jan. 1, 1915, at 812,300. Capital, Mitau or Mitava, with a population of 46,800; largest city, Libau, with a population of 90,700. It was part of Russia after the third partition of Poland in 1775. See **LATVIA.**

COPPER. THE INDUSTRY IN 1919. The principal features of the American copper industry during the year 1919 are shown in a statement of the United States Geological Survey as follows:

The smelter output in 1919 was about 1,310,972,000 pounds, a decrease of 597,561,000 pounds from that of 1918. The production of refined primary and secondary copper from domestic and foreign ore and metal was 1,863,580,000 pounds, which was 612,497,000 pounds less than the production in 1918. Refined primary copper amounting to 326,043,000 pounds was produced from ore or other material imported from foreign countries, principally Chile, Peru, Mexico, and Canada. The discrepancy between the smelter production and the refinery production is due to the fact that 562,000,000 pounds of blister copper and other material was in process of refining at smelters and refineries or in process on Jan. 1, 1919, and though it was smelted in 1918 was not refined until 1919. In 1919 the imports of copper in all forms amounted to 429,388,000 pounds, and the exports of copper in all forms amounted to 516,628,000 pounds, which was 231,062,000 pounds less than the exports in 1918 and 616,205,000 pounds less than those in 1917. The exports in 1919 were less than in any year since 1907. On Jan. 1, 1919, the stocks of refined copper were 180,000,000 pounds, and on Jan. 1, 1920,

they were 631,000,000 pounds, an increase during 1919 of about 451,000,000 pounds. The stocks on Jan. 1, 1920, were several times greater than they have ever been before. In addition to the stocks of refined copper in hand about 310,000,000 pounds of blister copper and material was in process of refining at smelters and refineries or in transit on Jan. 1, 1920. This estimate does not include blister in foreign smelters destined for the United States for refining nor material in transit to the United States from such smelters. The apparent domestic consumption in 1919 was about 876,564,000 pounds, which is 785,106,000 pounds less than that in 1918 and less than the domestic consumption in any year since 1914.

Many causes contributed to decrease the smelter and refinery production, the domestic consumption, and the exports, and to increase the stocks, but the principal cause was a poor market. The industry was working at maximum capacity when the war demand for copper ceased, and it was then, of course, forced to continue production only at the rate required to supply the ordinary commercial and industrial demand. The war demand was stopped so suddenly as to disturb greatly the trade and industrial conditions, and the prospects for the immediate future appeared so uncertain that few industries were able to continue production without first decreasing it greatly and reorganizing, to some extent, their industrial mechanism. Under the peace-time conditions the demand for copper was small and the average price soon fell from 24.7 to about 15 cents a pound. This price was far below the actual cost of the production of a very large part of the previous year's output. All smelters and mines were forced to decrease production. Some were shut down entirely; others were operated at the minimum capacity that would keep the organization intact and the equipment in proper order. Much of the copper in stock could not be profitably held, and the placing of a large part of it on the market kept the price down, though it showed a tendency to rise when the readjustment set in. The price during the year showed many fluctuations but averaged only 18.6 cents a pound, which was about 24 per cent less than the average price in any year since 1915, though the cost of labor and supplies had risen as much as 150 per cent during that time. The labor troubles in other industries decreased the demand for copper, increased the cost of supplies used by the copper industry, and materially increased the cost of production. By the time the price of copper had risen high enough to permit the industry to meet these unfortunate conditions foreign exchange began to fall so rapidly that foreign buyers were unable or reluctant to purchase American copper, and finally the exchange between the United States and foreign centres dropped so low that they could no longer buy it. These conditions almost ruined the foreign market for American copper, and the demand and the price in the domestic market were less than they had been at any time for several years. On the whole, the year was an unsuccessful one, and in view of the conditions it is remarkable that the industry remained as stable as it did.

CONDITIONS IN 1920. During 1920 the American copper industry experienced reduced production and demand for the metal with falling prices and decreased exports. Labor troubles also figured but with little incentive for producers to

run their plants to anything like capacity they were not serious features of the year. The commercial situation not only in America but in Europe, where there were revealed large stores of scrap or unused copper or copper alloys, was appreciated early in the year and was reflected in a decline of prices and diminished demand. The larger producers cut down their output materially in some cases, working at about one-half the rate of 1918, while in general the tendency was to carry on the least expensive workings and only essential developments. The accompanying table of prices in New York and London from the *Engineering and Mining Journal* (New York) represents the market conditions. It will be seen that by October radical reductions were found to be inevitable and after slight price changes during that month, in November there was a decline from 15 to 13.5 cents which provoked some buying among large consumers with adequate resources, but in view of the generally poor conditions of manufacturing industry did not stimulate the market. In fact at the end of the year secondary copper and copper alloys from munitions and other activities were offered by the government at low prices, while as suggested, European consumers were well supplied with large amounts of old copper as well as brass and other alloys obtained of course from munitions manufactured and salvage. In fact it was stated that in England a single firm had salvaged at least 300,000,000 pounds of copper from brass, copper shell bands, and other articles which were available for general consumption at a low price. However, even with general low prices not only for salvaged metal but for exports from America, industrial Europe was in no position to utilize supplies however cheap, and of course the same conditions were more or less true in the United States. As a result there was in progress a general stabilizing of the industry after its great war activities and the closing out of accumulated stocks. Apparently the producers were waiting for industry to absorb the various supplies on the market and then when the inevitable demand came with the development of industry particularly in electric railway and electric power development there would be a large demand for copper which would be met by various properties working to something like full capacity. In this connection reference might be made to the development and construction work in progress during 1920 in Peru where the Cerro de Pasco Mining Company began the construction of a new \$9,000,000 smelter with a capacity of 2500 tons at Oroya, besides additions to its existing plant. The Peruvian Copper and Smelting Company was also engaged in the development of its extensive copper deposits at Yauricocha and Felicidad.

The preliminary estimate of the smelter production of copper from domestic ores during the year 1920 made by the United States Geological Survey, Department of the Interior, was about 1,235,000,000 pounds, compared with 1,286,000,000 pounds for 1919.

The production of refined copper from foreign and domestic ores for 1920 was about 1,573,000,000 pounds, which was approximately 195,000,000 pounds less than for the year 1919.

The apparent domestic consumption was about 910,000,000 pounds, in 1919 it was 877,000,000 pounds.

The stocks of raw and refined copper at the end

UNITED STATES PRODUCTION, STOCKS, IMPORTS, EXPORTS, AND CONSUMPTION OF
COPPER, 1918-1920

(From Engineering and Mining Journal)

	1918 Pounds	1919 Pounds	1920 Pounds
Smelter output from domestic ores	1,908,500,000	1,288,000,000	1,235,000,000
Refinery production of new copper from domestic and foreign ores	2,432,000,000	1,768,000,000	1,573,000,000
Stocks at the end of the year, at smelters and refineries	742,600,000	904,000,000	*873,000,000
Imports	575,805,115	429,387,594	*407,437,515
Exports	747,689,580	516,627,775	*548,695,851
Apparent domestic consumption	1,662,000,000	877,000,000	*911,000,000

* Amount contains 683,000,000 lbs. of refined copper and 190,000,000 lbs. of blister copper. * Total for ten months ending Oct. 31, 1920, from records of the Bureau of Foreign and Domestic Commerce. * Estimated.

of 1920 were about 874,000,000 pounds, representing a decrease of 30,000,000 pounds from those held at the end of 1919.

The total imports of raw and refined copper for the 10 months ended Oct. 30, 1920, according to the Bureau of Foreign and Domestic Commerce, were 407,437,515 pounds.

Exports of copper for the same period were 543,695,851 pounds, compared with 516,627,775 pounds for the entire year 1919.

The continued decreased production, the large stocks, and the low domestic consumption were due entirely to the generally depressed conditions of industry throughout the world, which did not permit the absorption of as great quantities of copper as had been hoped for.

Low exchange and the great stocks of scrap and secondary copper available both in the United States and abroad also decreased the demand for new copper.

The salient features of the copper industry during 1920 were a small hesitating demand, decreased production, continued small exports, particularly during the last half of the year, and labor troubles. See AGRICULTURE.

COPYRIGHT. Registrations for the fiscal year 1919-20 according to the report of the Register of Copyrights were 126,562 as compared with 113,003 for the year before. Of these, 39,090 were classed as books, but included pamphlets, leaflets and contributions to periodicals. Of this number 37,710 were printed in the United States and 939 printed abroad in a foreign language. The remainder, namely 441 consisted of English books, registered for ad interim copyright. The chief classes numerically of the remaining registrations were music compositions; periodicals; prints and pictorial illustrations; photographs; dramatic or dramatic and musical compositions; works of art, models or designs; maps; motion picture photo-plays. The renewals numbered 2112 as compared with 1906, the year before. The fees paid during the year amounted to \$126,492. The total number of articles deposited during the period from July 1, 1897, to June 30, 1920, was 4,426,091.

On Dec. 18, 1919, the act for the retrospective protection of books by foreign authors was ap-

proved by the president. This provided that all works made the subject of copyright by the laws of the United States first produced or published abroad, during the war whose authors are citizens or subjects of a foreign state which grants similar protection in the case of the United States, shall be entitled to the protection conferred by the copyright laws of the United States. On Feb. 9, 1920, the British government granted "similar protection" for works by citizens of the United States and on April 10, 1920, the President by proclamation extended to the subjects of Great Britain and all her possessions with the exception of Canada, Australia, New Zealand, South Africa, and Newfoundland, the benefits of the United States copyright laws. In the fiscal year 1919-20 a public printing bill was under consideration providing that no government publication or any portion thereof should be copyrighted.

In respect to international copyright, the Register of Copyrights in his annual report made the following recommendations:

The present unequal and inadequate exchange of literary-property protection is a matter of nearly 30 years' standing and requires radical change in order to effect satisfactory solution. There seems to be a general agreement that the fundamental obstacle to a better arrangement is the requirement of American manufacture of books and prints. It is generally agreed that copyright protection should not be subject to this kind of condition. It is the principal obstacle to entry by the United States into the International Copyright Union. The desire has been expressed that the United States should become a member of this union. To do so, however, would require not only the abrogation of the typesetting clause, so far as foreign books are concerned, but the abolition as well of the necessity for deposit of copies and registration. American book publishers believe that an accessible, official registration in the United States of all works in which copyright is claimed is desirable for their business interests. By express provision of law the present certificate of copyright registration is required to be "admitted in any court as prima facie evidence of the

facts stated therein"; and this is a great convenience. So far, also, as books, music, and prints deposited in the Copyright Office are added to the collections of the Library of Congress, their use therein advertises the existence of such works, and the copyright proprietor receives the advantages which may come from the distribution to some 2500 libraries of the printed title cards for copyrighted books.

Possibly some middle course might be adopted for foreign books; e.g. the substitution for the deposit of copies for registration of some arrangement for the regular and systematic filing in the Copyright Office of the printed bibliographical records of works published in foreign countries, and the preservation and indexing of such foreign book catalogues in this office. The information thus made available to American publishers might be sufficient for their needs. So far as American copyright works are concerned, the Catalogue of Copyright Entries now compiled and printed under provisions of law supplies a complete, well arranged and indexed record of all works copyrighted in the United States and the current issues of this catalogue could be supplied to designated offices in other countries.

If some such arrangement could be substituted for the present requirement of deposit of copies and formal registration of books by foreign authors printed abroad, and the manufacturing conditions of the copyright statute of March 4, 1909, be abrogated, at least so far as foreign works are concerned, the United States might enter the International Copyright Union. If something of this kind can not be agreed upon, special arrangements should be entered into with the English-speaking countries to expressly guarantee full protection in all these countries for the works of authors, playwrights, composers, and artists (who are citizens or subjects of any one of them) from the date of the production or first publication of such works in any one of the countries.

This assured protection for all intellectual works throughout all the English-speaking and reading nations should be free of any technical or merely formal requirements, except such as are mutually agreed upon as desirable.

CORBET, EUSTACE KYNASTON. British colonial official, died March 21. He was born in Lincolnshire, June 22, 1854, and educated at Balliol College, Oxford. From 1885 to 1891 he was secretary to the Khedive of Egypt and for the next six years judge in the native court of appeal, after which he became procureur-général of the native courts of Egypt (1898-1908). For the next five years he was director of the Egyptian educational mission in England. He wrote a verse translation of Lessing's poem, *Nathan der Weise*.

CORBETT, HUNTER. Missionary, died at Chefoo, China, January 12. He was born at Leatherwood, Pa., Dec. 18, 1835, graduated at Jefferson College, 1860, and at the Princeton Theological Seminary, 1863. From that time he was foreign missionary in China. In 1906 he was moderator of the Presbyterian General Assembly. Among his writings may be mentioned: *Ten Commandments*; *Benevolence*; and a work on church history, written in Chinese.

COEN. Data on the corn production of the world in 1920 were very incomplete. Preliminary estimates by the International Institute of Agriculture, Rome, for seven countries, including the United States and Argentina, and represent-

ing about 76 per cent of the world's supply, indicated a production of 3,578,935,000 bushels as compared with 3,262,098,000 bushels in 1919.

Estimates of production given for various countries were as follows: Argentina, 1919-20 crop, 258,686,000 bushels; Uruguay, also the 1919-20 crop, 2,784,000 bushels; Hungary, 50,329,000 bushels; Bulgaria, 39,650,000 bushels; Czechoslovakia, 6,138,000 bushels; Italy, 86,609,000 bushels; Indo-China, 5,732,000 bushels; and the Union of South Africa, 36,059,000 bushels. The total yield of Canada was placed at 13,696,000 bushels of husked corn in addition to the usual large tonnage grown for fodder and silage, which for the past year was placed at 5,407,000 tons.

As estimated by the Department of Agriculture, the United States produced 3,232,367,000 bushels as compared with 2,858,509,000 bushels in 1919 and the average of 2,760,484,000 bushels for the five-year period 1914-18. The area devoted to corn in 1920 was given as 104,601,000 acres or 4,529,000 acres more than were grown in 1919, but 2,624,000 acres less than the average acreage for the five-year period mentioned. The average yield per acre was 30.9 bushels or 2.3 bushels above the average yield of 1919 and 5.2 bushels above the average for the years 1914 to 1918 inclusive. The total production and the average yield for 1920 are the highest ever recorded.

The average farm value on Dec. 1, 1920, was 67.7 cents per bushel as against the corresponding price of \$1.349 the year before, and 94.6 cents, the average for the five-year period 1914-18. On this basis the crop of 1920 was valued at \$2,189,721,000; that of 1919 at \$3,851,741,000, and the five year average at \$2,612,389,000. In quantity and value the corn crop of the United States ranks high above any other crop produced, and makes this country by far the most important corn producing country of the world. The annual production of the United States is from 10 to 15 times as large as that of any other country and represents nearly 80 per cent of the world's yield. Before the European war Austria-Hungary, Mexico, and Argentina producing about 200,000,000 bushels ranked next in production. Roumania and Italy each produce about 100,000,000 bushels and British India, Russia, and Egypt each approximately 75,000,000 bushels.

The great bulk of the crop of the United States is consumed at home, and estimates by the Department of Agriculture indicate that practically never more than 25 per cent is shipped out of the county in which it is grown, and not more than 10 per cent reaches the large primary markets, showing that about one-half of the corn shipped out of the county of production goes into the hands of feeders and other local consumers and does not reach the central markets. During recent years exports from the United States have averaged less than 2 per cent of the total crop, and the last year or two corn has even been imported. In October, 1920, 3,000,000 bushels of corn from Argentina were reported on hand in New York. Before the European war Argentina and Roumania were the chief corn exporting countries, the United States ranking third. From January to June, 1920, about 60,000,000 bushels of corn were shipped by Argentina, mostly to Europe. The chief importing countries are the United Kingdom and the countries of northern continental Europe. The requirements of

the United Kingdom range from 80,000,000 to 100,000,000 bushels annually.

A marked decline in the price of corn took place during the latter half of 1920 and the price at the close of the year was only 25 to 30 per cent above the average price before the war. As the cost of production had been exceptionally high, this decline caused farmers to sustain heavy losses. The decline in price was considered due largely to the record crop of 1920 and the reduction by 50 per cent of the demand for pork on the part of foreign countries.

Corn oil, as pointed out in United States Department of Agriculture Bul. No. 904, is becoming better known for its value for edible purposes and its use in many ways in place of cottonseed oil. It has been introduced recently in Arabia and India and found to be an acceptable and satisfactory substitute for ghee, a kind of butter used in those countries.

The European corn borer quarantine was extended during the year under authority of the Department of Agriculture to additional towns in Massachusetts, New Hampshire, and New York, as supplementary to former orders against localities in these States, and in Pennsylvania to prevent interstate shipments of material in which the borer might be carried. The borer was reported the past year from Canada in localities further west than those in which it occurs in the United States. The insect attacks largely the flint varieties. Experiments conducted by the Department of Agriculture and the Indiana Experiment Station showed that seed corn with 100 per cent germination but infected with harmful organisms as indicated by discoloration at the butts of the ears and kernel tips, and by decay in the cobs, gave yields from 10 to 30 per cent smaller than those secured from disease-free seed corn.

CORNELL UNIVERSITY. A non-sectarian co-educational State institution of higher learning, at Ithaca, N. Y., founded in 1865. For the fall session of 1920 there were 5176 students enrolled and for the summer session, 2174. There were 847 members of the faculty. The income from productive funds was \$738,100; from tuition fees \$975,000, and from State and nation \$1,397,800. The university received from August Heckcher of New York \$500,000 for the endowment of research. There was \$5,700,000 added to the endowment for the increase of teachers' salaries and \$708,000 was received for other purposes. The library contained about 630,000 volumes. President Jacob Gould Schurman having resigned, Dean Albert W. Smith was elected acting-president. See AGRICULTURAL EDUCATION.

CORN OIL. See CORN.

CORN STALK BORER. See CORN.

CORPORATIONS. See TAXATION AND TRUSTS.

CORTHIS, ANDRE. See FRENCH LITERATURE.

COSTA RICA. A republic of Central America lying between Nicaragua and Panama, with the Caribbean Sea on the east and the Pacific Ocean on the west and south. Capital, San José.

AREA AND POPULATION. Estimates of area vary, the closest figure apparently being 18,691 square miles. Another estimate places it at about 23,000 square miles. The population according to the estimate of Dec. 31, 1918, was 459,423, of which the greater part were in the

provinces of San José and Alajuela. The vital statistics in 1918 were as follows: Births, 18,412; deaths, 14,034. The immigrants in that year numbered 857 and the emigrants 2157. The city of San José had a population of 38,016. Most of the people of European descent live at or near the capital and in the towns of Cartago, Heredia, Alajuela, Liberia, Punta Arenas, and Limón. The colored population, mostly British West Indians, numbers about 18,000.

EDUCATION. Primary education is free and nominally compulsory. In 1918, there were 315 elementary schools with 950 teachers and an enrollment of 25,857 pupils. There are a lyceum and a college at San José and a normal school at Heredia; there is also a college in each of the towns, Cartago, Alajuela, and Heredia. There is a medical faculty, and schools of law, pharmacy, and dentistry.

PRODUCTION. The chief occupation is agriculture and the chief products are coffee, bananas, and forest products, including rich supplies of rosewood, cedar, mahogany, and other cabinet woods. In 1919 the coffee was exported to the amount of 30,784,184 pounds. Bananas were produced to the amount of 7,129,655 bunches. Aside from agriculture and fruit-raising, the most important industry is gold and silver mining in the districts on the Pacific slope. There is a considerable cultivation of corn, sugar cane, rice, and potatoes, and some tobacco is grown.

COMMERCE. The following estimates in regard to commerce are supplied by the Pan-American Union.

The total foreign trade in 1919 was 54,337,255 colones (colon equals \$0.4653), which compared with the 29,728,809 colones foreign trade of 1918, shows an increase of 24,608,446 colones. In 1919 the imports were 16,167,718 colones, as against 8,032,306 colones in 1918, or an increase of 8,135,412 colones; the exports, 38,169,537 colones, as against 20,696,503, or an increase of 17,437,034 colones. The chief exports of 1919 were coffee, 13,963,473 kilos, worth 25,103,804 colones; bananas, 7,270,624 bunches, worth 1 colon per bunch; woods, balso, cedar, cocobolo, mahogany, etc., 6,740,721 kilos, worth 578,219 colones; hides and skins, 476,683 kilos, worth 385,694 colones; cacao, 1,698,122 kilos, worth 1,158,411 colones; sugar, 2,043,815 kilos, worth 529,428 colones; gold, 1,557,473 colones; silver, 21,456 colones, and coined silver, 100,000 colones.

The following table taken from the *Statesman's Year Book* for 1920, shows the value of the chief imports and exports in 1917 and 1918.

	Imports	
	1917	1918
Cotton goods	\$54,918	\$94,075
Cattle	25,292	94,600
Coffee bags		28,077
Flour	111,859	58,835
Lard	28,189	8,156
Drugs	29,473	16,686
Rice	30,981	9,278
	Exports	
	1917	1918
Bananas	\$868,951	\$682,263
Coffee	812,848	762,181
Gold, silver, and concentrates from mines	214,245	163,724
Hides and skins	70,877	27,214
Timber	62,198	94,420

The following information in regard to the foreign trade in 1919 was supplied by the United States Bureau of Foreign and Domestic Commerce in November, 1920: The total foreign trade in 1919 was 54,337,255 colones, consisting of imports, 16,167,718 colones and exports, 38,-

169,537 colones. The United States still held the first place in foreign trade and in 1919 its share of the import trade increased, but its share of the export trade declined. In 1919 the imports from the United States made up 78.36 per cent of the total and the exports to the United States 55.28 per cent.

COMMUNICATIONS. In 1919 there entered the ports of the republic 479 vessels of 486,131 tons. Four shipping companies send steamships regularly to Limon and there are three lines which touch at the port of Punta Arenas on the Pacific. San José is connected with the ports of Limon and Punta Arenas by railroads. The Costa Rica Railway and the Northern Railway of Costa Rica extend from Alajuela through San José and Cartago to Port Limon, with a branch from Siquires to Guapiles, a branch from Limon to Zent, and a branch from Limon to La Estrella, or a total length of 566 kilometers (1 kilometer = 0.621 mile), and are operated by the Northern Railway Company. The Pacific Railroad, owned by the government, runs from San José to Punta Arenas with branches to Alajuela and Esparta, a length of 134 kilometers. The post offices in 1918 numbered 182 and telegraph lines had a mileage of 15,170.

FINANCE. The monetary unit is the colon with a par value of 46.536 cents and the standard of value is gold. The chief sources of revenue are direct taxation, customs, railways, posts, telegraphs, and liquors; and the chief objects of expenditure are finance, internal development, and public instruction. The following details in regard to the budget for 1920 are supplied by the Pan-American Union:

The national budget, approved January 7th by the President, for the fiscal year 1920, estimates the expenditures at 12,866,553 colones (colon equals \$0.4653) and the revenue at 13,006,000 colones, leaving a probable surplus of 139,447 colones. The expenditures for the year are as follows: Legislative body, 176,630 colones; public instruction, 1,561,408 colones; government section and judicial police, 1,398,829 colones; promotion, 1,263,140 colones; foreign relations, 111,361 colones; justice, 419,880 colones; religion, 20,400 colones; public charity, 160,421 colones; war department and military police, 1,634,349 colones; navy, 35,240 colones; treasury, 1,688,560 colones; payment on the public debt, 4,396,334 colones.

GOVERNMENT. A new constitution was adopted July 13, 1917, and a new election law was passed, Oct. 28, 1918. The president and vice-president are chosen by an electoral college consisting of senators and Deputies. The legislative power resides in a chamber of representatives elected for four years, one-half retiring every two years. Suffrage is universal. There are six secretaries of state appointed by the president and responsible to him: Interior and Police; Foreign Affairs; Justice and Worship; Public Instruction; War and Marine; Finance and Commerce. The President at the beginning of 1920 was Don Julio Acosta, elected December, 1919, and inaugurated May 8, 1920. The first diplomatic representative from Costa Rica since the early part of the war was received in Washington on November 29th. See GUATEMALA.

COST OF LIVING. See PRICES.

COTTON. The cotton crop of the United States for 1920 was estimated at 12,987,000 bales of 500 pounds gross weight, by the Crop Report-

ing Board of the United States Department of Agriculture on Dec. 13, 1920. On Nov. 20, 1920, the International Institute of Agriculture at Rome announced an estimate of 12,098,020 bales. Each of these estimates indicates an increase over the crop of 1919, which was 11,420,763 bales. While the Department of Agriculture estimates a crop larger by 1,500,000 bales than in 1919, the farm value on Dec. 1, 1920, was only \$914,590,000, or about 45 per cent of the value of the previous crop. The estimated average price of cotton to producers on Jan. 1, 1920, was 35.9 cents a pound, as compared with 14 cents on Dec. 1, 1920. On Dec. 13, 1920, according to the Bureau of the Census, there had been ginned of the 1920 crop, 10,878,265 running bales. This included 198,184 round bales, 54,467 bales of American grown Egyptian, and 1291 bales of Sea Island cotton. The continued reduction in the amount of Sea Island cotton is due to the spread of the boll weevil. The American-Egyptian cotton was practically all produced in Arizona and California. These States are estimated to have produced 100,000 bales of this type of cotton in 1920.

The cotton crop of Egypt for 1920 is estimated at 1,225,636 bales of 500 pounds each, an increase of 100,000 bales over the production of 1919. The area planted to cotton in British India in 1920 was about 8,900,000 acres, a reduction of 3.2 per cent from that of 1919 when the crop was 4,666,200 bales. The Mexican crop for 1920, exclusive of that of Lower California which is commonly marketed with that of California, is estimated at 70,000 bales. British South Africa produced in 1919 about 2000 bales of cotton. Burma exported 273,569 tons of cotton in 1919, and Brazil 2594 tons. Production figures for these countries are not available for 1920. Bulgaria has resumed cotton production and an estimated crop of about 1200 bales for 1920 is reported.

The following table shows the cotton crop for 1919, the estimated crop for 1920, and the amount reported ginned to Dec. 13, 1920:

States	Crop, 1919 500 lb. bales	Estimated crop, 1920 500 lb. bales	Reported ginned Running bales
United States . . .	11,420,763	12,987,000	10,878,265
Alabama	713,236	660,000	605,939
Arizona	59,849	110,000	66,794
Arkansas	884,473	1,160,000	885,208
California	56,107	150,000	37,802
Florida	15,922	18,000	17,553
Georgia	1,659,529	1,400,000	1,323,752
Louisiana	297,681	380,000	354,798
Mississippi	960,886	885,000	775,519
Missouri	64,031	85,000	49,592
North Carolina	830,293	840,000	680,054
Oklahoma	1,016,129	1,300,000	860,184
South Carolina	1,426,146	1,530,000	1,364,650
Tennessee	310,044	310,000	234,763
Texas	3,098,967	4,200,000	3,601,851
Virginia	22,528	19,000	12,376
All other States	4,947	15,000	7,485

In addition to the 11,420,763 bales of cotton lint of the 1919 crop, there were produced 611,076 bales of linters and there was received at oil mills 4,018,233 tons of cotton seed. For the year ending July 31, 1920, there were crushed 4,009,860 tons of cotton seed which yielded 1,210,494,748 pounds of oil, 1,815,660 tons cotton seed cake and meal, 1,140,735 tons hulls, and 150,340 bales of hull fibre. The exports of cotton for the year ending July 31, 1920, were 6,598,348 bales, an increase of 934,428 bales over the exports of 1919. The principal shipments were: To the United Kingdom, 3,069,342; France, 576,228;

Italy, 579,159; Germany, 443,179; Japan, 873,096 bales. The imports for the same period were 700,213 bales as follows: Egypt, 485,003; Peru, 63,425; China, 57,186; Mexico, 65,343, and all other countries, 29,256 bales. The world's production of commercial cotton in 1919, exclusive of linters, was about 20,250,000 bales of 500 pounds net, while the consumption for the year ending July 31, 1919, was about 15,970,000 bales.

The number of active and idle spindles engaged in the cotton industry in the world is about 150,000,000. In the United States there were in July, 1920, 34,866,842 active spindles, 15,077,079 of which were in the cotton growing States and 19,589,763 in the other States. These spindles consumed during the year 6,425,344 bales of cotton. In Europe, out of a total estimate of 94,079,692 spindles, 73,121,035 were reported as active for the year ending July 31, 1920. Germany, for the first time since 1914, is reported as having resumed spinning and had 5,230,996 spindles at work out of an estimated total of 9,400,000.

Under a revised plan of operation the government of Great Britain has granted £50,000 annually for five years to the British Empire Cotton-growing Committee. In addition the committee is to receive, as a voluntary contribution from cotton manufacturers in the United Kingdom, 6d for every bale of cotton used. This contribution is estimated to yield about £100,000 annually. Through the committee efforts are being made to develop cotton growing in the British colonies and protectorates. Surveys have been made of India and Egypt and suggestions are made as to probable means for increasing yields and improving the quality of the fibre produced. In India most of the native cottons are short staple and the varieties are badly mixed. Attention is being turned to the breeding of improved strains of the indigenous varieties and some promising forms are said to have been produced. The testing of American varieties is being continued and in many of the states premiums are offered for the growing of American cottons.

A survey of Mesopotamia, as a cotton producing region, has been completed and it is claimed that 200,000 acres could be devoted to growing cotton with the present population, if suitable machinery and transportation are provided. A government experiment station has been established at Bagdad where excellent Egyptian and long staple American cottons have been grown. Substantial progress is reported in cotton growing in Rhodesia and South Africa where the industry is now considered firmly established. A government loan has been secured for Sudan, and with the construction of railways and irrigation works it is expected cotton growing will become an important industry. A British Cotton Research Association has been established at Manchester, England, and a number of technical investigators have been appointed. In cooperation with the Empire Cotton-growing Committee, three botanical research fellowships have been established.

Efforts are being made to develop cotton growing in Belgian Congo where it is claimed about 5000 acres were planted in 1920. An experimental cotton farm has been established near Lusambo, and the American varieties Triumph and Simpkins have been found especially adapted to the local conditions. A French concession

of 25,000 acres for cotton growing in Armenia is reported. The manufacture of cotton is developing rapidly in China. In 1919 there was produced the largest crop ever reported in China, and during the same period 27,743,733 pounds of cotton were imported to supply the mills. Increased interest in cotton growing is reported in Argentina. The principal region of production is in the Chaco Territory where about 150,000 acres were planted to cotton in 1920.

On account of the danger of the introduction of the boll weevil, the importation of cotton seed into Argentina is prohibited. The state of Bahia, Brazil, is aiding in cotton production by the distribution of seed and granting prizes to planters showing the most progress in the improvement of their crops. In Mexico the embargo on the shipment of cotton was removed Sept. 1, 1920, and in its stead an export tax of five centavos per kilo was declared. On Dec. 17, 1920, an import duty of 7½ cents per kilo was placed on all raw cotton entering Mexico.

The cotton situation in the United States, from the producers' standpoint has been far from satisfactory. The rapid fall in price with the incoming of the new crop led to unexpected losses. To check the fall in price attempts were reported to have been made to burn warehouses and gins, prevent the picking of cotton, etc. Various plans were proposed to improve the selling situation, some of which involved government aid and others financial assistance through banking and other agencies. A campaign for a smaller cotton crop in 1921 has been inaugurated in which it is proposed to restrict the area to be planted, a reduction of 50 per cent in the acreage being suggested by some of the advocates of the plan.

The United States Department of Agriculture published the results of a study of 842 farms in Alabama, Georgia, South Carolina, and Texas, to determine the cost of producing the 1918 cotton crop. The average cost was found to have been 23 cents per pound of lint. In order that 85 per cent of the crop should have been produced at a profit it should have sold at 28 cents per pound, and the average price to producers in 1918 was but little above that figure. On account of reduced yields and increased costs, the crop of 1919 probably cost considerably more for its production.

The pink boll worm situation has assumed a rather serious phase. Late in 1919 scattered areas in the Trinity Bay district in Texas, where the pink boll worm appeared in 1917, were found to be reinfested. Some others were found in the Pecos Valley and in the Great Bend country, where the infected cotton was destroyed. In October, 1920, rather wide infestation was found in the Trinity Bay District. No reappearance of the pink boll worm was reported elsewhere in Texas in 1920. The failure to eradicate this pest is thought to have been due to the non-observance and continuance of non-cotton zones about the infested area. The Legislature of Texas passed a new law that became effective June 19, 1920, but it is said to have numerous defects and the Federal authorities think that effective work cannot be carried on under it.

The pink boll worm was found to have invaded several parishes in Southwestern Louisiana, and legislation has been enacted providing for the establishment of non-cotton zones for all the infested districts and regulating the movement of cotton and seed throughout the State. After a

number of conferences a Federal quarantine of Texas and Louisiana was promulgated that became effective August 1, 1920. This regulates the movement of all forms of cotton in the infested portions of the two States concerned. The pink boll worm was found in Dona Ana County, New Mexico, near El Paso, and quarantines are contemplated for this region.

Appropriations available for pink boll work amount to \$838,560, the Federal government contributing \$488,560; Louisiana, \$250,000; and Texas \$100,000.

The cotton boll weevil has continued its advance towards the northern limits of cotton growth. During 1920 the last remaining counties of Georgia became infested, all of South Carolina, and about a dozen counties in South-eastern North Carolina from Union to Onslow counties. The ravages of the boll weevil along the coast region have been so serious as to practically destroy the Sea Island cotton industry. Attempts are being made to produce early maturing varieties of Sea Island cotton that may escape injury by the boll weevil and some promise of success is reported. Early in 1920 it was reported that the boll weevil had been introduced into Porto Rico, but later information indicates that in all probability the pests did not become established.

The use of calcium arsenite for the control of the boll weevil (YEAR BOOK 1919, p. 180) has been widely adopted, and it is reported that fully 10,000,000 pounds of the chemical were used during the past season. The United States Department of Agriculture has devised a wheel-traction dusting machine that is said to be more efficient than any other power machine under present labor conditions.

An international Cotton Congress was held at Zurich, Switzerland, June 9-11, 1920. A World Cotton Conference will be held in Liverpool and Manchester, England, June 13-22, 1921.

COTTON BOLL WEEVIL. See COTTON. **COUNTY AGENTS.** See AGRICULTURAL EXTENSION.

COX, FRANCIS ALBERT. British philanthropist, died, May 25. His whole life was devoted to improving the treatment of animals. He was born June 24, 1862, and was in the civil engineers department of the Great Northern Railway for nearly 30 years. His work on behalf of pit ponies in 1908 led to the creation of the National Equine Defense League, of which he became secretary. In the latter part of his life he devoted himself exclusively to the work of this association. He also carried on an active campaign against the practice of docking horses. In 1915 he was prominent in the work for the relief of the employment of Belgian refugees. He wrote many pamphlets including *A Dog's Life*; *The Pit Pony*, etc.

COX, JAMES M. Democratic candidate for President in 1920; Governor of Ohio. He was born at Jacksonburg, Ohio, March 31, 1870, and educated in the public schools. He was brought up on a farm, worked in a printer's office, and taught in country schools. In his youth he became a newspaper reporter and rose to an editorial position on the *Cincinnati Enquirer*. In 1898 he bought the *Dayton Daily News* and in 1903, the *Springfield Press-Republic*, and formed the News League of Ohio. He was member of the 61st and 62d Congresses, 1909-13 from the third Ohio district and was Governor of Ohio for

the terms 1913-15, 1917-19, and 1919-21. His administrations were marked by a progressive spirit and he did much to promote legislation for the improvement of industrial conditions. See UNITED STATES.

CRANE, W. MURRAY. Former Senator, for a long time a prominent figure in Republican politics, died at Dalton, Mass., October 2. He was born at Dalton, Mass., April 23, 1853, the son of a paper manufacturer and educated at the public schools and Williston Seminary. He entered the paper mill at Dalton and continued to retain an interest in it throughout his life. It became an extensive establishment and produced the paper used by the government for currency and bonds. He was Lieutenant-Governor of Massachusetts, 1897-99; Governor, 1900-02; was elected United States Senator in 1905 and re-elected for the term 1907-13; and he was a delegate to the Republican National Conventions in 1892, 1896, and 1904, and to each of the five thereafter including that of 1920. His business record was remarkable for the skill and tact which he showed in avoiding strikes. As a member of the Senate he made no speeches but exerted a wide influence and showed especial ability in bringing divergent factions into harmony. He was a supporter and friend of Theodore Roosevelt by whom he was held in high esteem. His illness developed while he was attending the ceremony at Northampton at which Governor Coolidge was notified of his nomination to the vice-presidency. He was a firm supporter of the League of Nations.

CRETE. An island in the Mediterranean Sea under Turkish suzerainty, till May 31, 1913, when it was ceded to the Balkan Powers, which by the treaty of August 10, 1913, recognized its union with Greece. Area, 3327 square miles; population, 1911, 344,001; capital, Canea, with a population of 25,185. The language is Greek and the majority of the inhabitants belong to that race. The exports are mainly wheat, fruits, olive oil, wool, soap, cheese, carobs, and valonia.

CRICKET. The feature of the year 1920 was the tour of the United States and Canada made by the Incogniti Cricket Club of England. Nine games were played, the English experts winning seven and drawing two. The intercity matches between Toronto, Canada, and Philadelphia resulted in a victory for the Canadians by an innings and 160 runs. Middlesex captured the county championship of England.

The annual tournament of the New York and New Jersey Cricket Association was won by the Manor Field Club, Staten Island finishing second. The Manhattan Club triumphed in the matches conducted by the Metropolitan District Cricket League.

CRIMINOLOGY. See PENOLOGY.

CRITICISM, LITERARY. See LITERATURE, ENGLISH AND AMERICAN.

CROATIA AND SLAVONIA. Formerly a crownland of the Hungarian Kingdom in the Austro-Hungarian Empire; after the downfall of the Central Powers, a part of Jugo-Slavia. It extends from the Danube and Drave rivers westward to the Adriatic. The area is 16,421 square miles; population, estimated in 1913 at 2,668,589; later estimates place it at 2,621,954. Agram is the capital, with a population in 1910 of 79,038. Its former executive head was the Ban, who was responsible to the Hungarian Prime Minister and to the Provincial Diet, and the

legislative power was in the Diet, which was composed of 19 members who served five years. See JUGO-SLAVIA.

CROKER, Mrs. B. M. Anglo-Indian novelist, died in London, England, October 21. She was the wife of Lieut.-Col. John Croker with whom she had spent 14 years in India and the East. Among her publications may be mentioned *Pretty Miss Neville*, which was the first one to attract wide attention (1883); *A Bird of Passage*; *A Family Likeness*; *Mr. Jervis*; *Her Own People*; *The Company's Servant*; *Interference*; *Beyond the Pale*; and *Terence*. The last-named was dramatized in the United States. Later works include: *Katherine the Arrogant* (1910); *In Old Madras* (1913); *Lismoye* (1914); *Given in Marriage* (1916).

CROP PRODUCTION. See AGRICULTURE.

CROSBY, FREDERICK VAN S. Railway financier, died in New York City, December 2. For 22 years he had been treasurer of the Union Pacific Railway. He was born at Troy, N. Y., March 15, 1860. After courses in various schools and studies in Europe he was a special student at the Columbia College School of Mines. He entered the service of the Union Pacific Railway Sept. 1, 1898. He was prominent in social and philanthropic activities.

CROSS COUNTRY RUNNING. Fred Fallor of the Dorchester (Mass.) Club successfully defended his title as national senior cross country champion of the Amateur Athletic Union in a race held at Boston. William Ritola of the Finnish-American A. C. of New York City finished second. Fallor's time for the 5½ miles was 29 minutes 1 second. The point trophy went to the Dorchester Club with a total of 26. The Paulist A. C. of New York City was second with 29 and the Stoughton Catholic Club third with 80. Fallor added to his laurels by winning both the New England championship and the national 10-mile title event.

Cornell captured the intercollegiate cross country championship in a race held at New Haven over a 6-mile course. The winner was credited with 55 points, Princeton furnishing a close second with 56. Other scores were: Massachusetts Institute of Technology, 90; Penn State, 135; Yale, 148; Syracuse, 158; Williams, 208; Columbia, 217; Harvard, 220; Pennsylvania, 261; Dartmouth, 297. The individual winner was John L. Roenig, of Penn State College, whose time was 33 minutes 1 second. The intercollegiate freshman race was won by Yale with Princeton second and Penn State and Syracuse tied for third.

The American Marathon, 25 miles, held under the auspices of the Boston A. A., resulted in victory for Peter Trivoulidos of New York City. His time was 2 hours, 29 minutes, 31 seconds. A. V. Roth of the St. Alphonsus Club, Roxbury, Mass., finished second, and C. W. A. Linder of the Hurja A. C., Quincy, Mass., third. Hannes Kolchmainen captured the Marathon conducted by the New York Athletic Club. He covered the regulation distance, 26 miles, 385 yards, in 2 hours, 47 minutes, 49½ seconds. J. Orgon of Pittsburgh took second place, while J. Tuomikoski of Quincy finished third. Fred Zuna led the way in the Seagate Marathon, 25 miles. See OLYMPIC GAMES.

CROZIER, JOHN. Archbishop of Armagh. See ARMAGH.

CRUISER. See BATTLESHIPS AND OTHER WAR VESSELS.

CRUMPACKER, EDGAR. Congressman, died May 19. He was born in Laporte County, Indiana, May 27, 1851, and was admitted to the bar in 1876. From 1884 to 1888 he was prosecuting attorney and from 1891 to 1893 he was judge of the Appellate Court of Indiana. He was a member of Congress from 1897 to 1913; a Republican in politics.

CRYSTAL ANALYSIS. See PHYSICS.

CUBA. A Latin-American republic in the West Indies comprising besides the island of Cuba the Isle of Pines and the small adjacent islands. Capital, Havana.

AREA AND POPULATION. The area is 44,215 square miles and the population according to the enumeration of November, 1919, was 2,898,905, an increase of 261,369 over 1916; density, 65.34 per square mile. There are six provinces, namely, Havana, Oriente, Santa Clara, Pinar del Rio, Matanzas, and Camagney. The largest and most populous is Oriente and the next in population is Havana. The city of Havana has a population of 360,517; other large towns are Santiago de Cuba, 63,041; Camagney, 93,063; Guantanamo, 60,216; Cienfuegos, 82,092; Manzanillo, 62,485.

PRODUCTION. The staple products are sugar and tobacco. Coffee, cocoa, cereals and potatoes are raised and there is a considerable production of fruits and minerals. In 1918-19, the sugar crop amounted to 4,446,229 tons, valued at 457,305,858 pesos. The value of tobacco manufactured in 1918 was 33,829,627 pesos. At the beginning of 1919, the livestock was as follows: Cattle, 3,965,600; horses, 779,496; mules, 64,570. The mineral production for 1919 was as follows: Iron ore, 200,000 tons; copper, 70,000 tons; manganese, 18,000 tons; asphalt, 10,000 tons; oil, 8,000 barrels. There are particularly rich deposits of iron in the western part. The manganese mining industry has been developed in the Province of Santiago de Cuba, but there are manganese resources in other parts of the island.

The total number of immigrants in 1919 was 80,485, an increase of 43,165 over the preceding year. Nearly one-half of the immigrants were Spanish and next in number were those from Jamaica. The American immigrants in 1919 numbered 1227.

COMMERCE. By far the most important article of foreign trade, comprising in fact the greater part of the exports is crude sugar. The United States has stood first both in respect to imports and exports. During the fiscal year 1918-19 the imports from the United States had a total value of \$235,727,000, an increase of \$7,625,000 over the preceding fiscal year. The imports from Great Britain had decreased by \$3,159,000 in the same period. The exports to the United States in the fiscal year 1918-19 were \$350,316,000, an increase of \$71,612,000 over the preceding fiscal year. Cuban exports to Great Britain in 1918-19 showed an increase of more than \$20,000,000 over the preceding fiscal year.

The following table shows the exports and imports for the year ending Dec. 31, 1919, in comparison with the preceding year:

	Exports	1918	1919
United States		\$294,665,337	\$439,633,986
United Kingdom		95,149,549	82,521,328
France		5,656,957	23,041,878
Spain		6,776,676	8,243,968
Germany			10,425
Other countries of America		9,428,079	10,912,602
Other countries of Europe		495,154	6,636,254
All other countries		1,153,497	1,909,987
Total		\$418,325,249	\$572,910,378

<i>Imports</i>	<i>1918</i>	<i>1919</i>
United States	\$222,262,276	\$272,192,946
Spain	10,392,529	15,911,198
France	7,044,221	9,905,719
United Kingdom	9,154,567	8,746,505
Germany	2	197,499
Other countries of America	20,257,023	27,257,637
Other countries of Europe	2,362,336	3,059,989
All other countries	26,149,261	20,805,029
Total	\$297,622,215	\$357,576,522

COMMUNICATIONS. The railway mileage in 1919 was placed at 3200 and comprised the United Railways of Havana, the Cuban Railroad, the Cuban Central Railway, and the Western Railway of Havana. The chief towns and seaports are now connected by railway lines and there are private lines connecting the sugar estates with the main lines. For some time past the nationalization of the railways has been under consideration.

ECONOMIC CONDITION. Toward the end of the year the conditions were so serious in Cuba that the United States government considered the plan of sending an American representative for the purpose of investigating conditions in the island and reporting remedial measures. Two of the large banks of Cuba were insolvent. It was reported that the next sugar crop could not be harvested without financial assistance and in that case a sugar shortage would follow. The banks which had loaned money to producers when the price was comparatively low were heavily involved.

EDUCATION. On Nov. 30, 1919, the number of teachers was reported at 5877 and the pupils at 334,671. On April 5, 1920, the number of teachers was placed at 6151 divided as follows: Primary grade teachers, 5686; traveling teachers, 117; kindergarten teachers, 137; and the rest consisting of teachers of night schools, schools of manual training, and other special schools, and teachers unassigned.

FINANCE. In 1919, the national revenue was 79,078,325 pesos (peso equals \$1), which, compared with the 64,478,772 pesos collected in 1918, shows an increase of 4,599,553 pesos. The revenue was derived from the following sources in 1919: Customs, 44,337,713 pesos; contributions and taxes, 15,450,291 pesos; stamp tax, 3,605,775 pesos; loan tax, 4,561,009 pesos; national lottery, 4,429,921 pesos; sundry revenue, 1,673,858 pesos; communications revenue, 2,133,622 pesos; port improvement taxes, 1,599,318 pesos; property and State taxes, 408,732 pesos.

An executive decree of June 30th made the 1920-21 budget the same as the previous year.

GOVERNMENT. The executive authority is vested in a president and a cabinet consisting of secretaries of state for justice; war and marine; interior; defense; agriculture, commerce, and labor; public instruction; public works; and sanitation and charity. Legislative power is in the national Congress made up of a Senate of 24 members and a House of Representatives, of 114 members. The President in 1920 was Gen. Mario G. Menocal. He was inaugurated May 20, 1913. For presidential election, see below.

HISTORY. The presidential election was fixed for November 1st. The candidates were Dr. Alfredo Zayas who was nominated by a coalition of Conservatives and Liberals, and Gen. Miguel José Gomez, the choice of the Liberals. The Liberal candidate, Gen. José Miguel Gomez, celebrated for his military career in the Cuban revolution, had led in the rebellion against Palma

which caused the second intervention of the American government and had been President 1909-13. He was the leader in a brief uprising against President Menocal in February, 1917. The Liberal party had divided into two factions, respectively headed by Gomez and Zayas, and Gomez received the nomination. The supporters of Zayas united with the Conservatives who feared that Gomez would be too strong for them. In the election of November 1st Zayas was pronounced successful. The supporters of Gomez, however, charged fraud at the polls, intimidation of voters, and suppression of returns in many places, and claimed the election of Gomez. They petitioned the President of the United States to order an investigation in accordance with the proclamation that had been issued by him, August 30, calling upon Cuba to hold a valid election. In that proclamation it had been said that while the United States government would not interfere, it would observe the conduct of the election and the spirit in which the law was enforced. Liberal papers in Cuba repeated the charges of election frauds and other crimes, presenting long lists of the outrages at the polls. The United States State Department declared that it would not pass judgment unless all requirements of law in respect to filing complaints with the Cuban Electoral Board had been fulfilled.

Conditions were disturbed also by financial difficulties. The moratorium was proclaimed on October 10th in order to avert a panic in the sugar market. The difficulties resulting from this and from the political situation caused many Cubans to leave the country for the United States. Toward the close of the year the high prices were causing great anxiety. Sugar had risen to 24 cents a pound and the prices of ordinary articles may be illustrated by the fact that shoes were selling at \$28 a pair. Meanwhile, the moratorium had been extended from December 1st to January 1st and cash payments were required. The question of an American loan was being agitated and an American representative was appointed to investigate and report upon the situation and serve as a financial adviser.

At the end of the year the financial and political situation in the republic was still so critical that the United States government had under consideration the sending of a representative to investigate conditions for it seemed possible that intervention under the authority of the Platt amendment might be necessary. Under that amendment, which constituted Article Three of the Cuban and American treaty of July 2, 1904, the United States had twice intervened. The result of the November elections in Cuba had not been determined at the end of the year. The term of President Menocal was to expire on May 20, 1921. On the face of the election returns, Zayas was elected, but the vote was almost even and there was a sufficient number of missing votes to elect his opponent if they were in the latter's favor. There had been three general elections in Cuba since its liberation and two of these had been followed by revolutionary movements. The difficulties resulting from the moratorium were still serious. Many Americans had suffered under its terms and the State Department had received many complaints. At the close of the year it was announced that the moratorium in Cuba had been extended to Feb. 1, 1921.

The increasing volume of travel and business between Cuba and the United States led to the

establishment of an aerial mail and passenger service between Key West and the island, which began November 1st. See AERONAUTICS.

CUBA. See AGRICULTURAL EXPERIMENT STATIONS.

CULBERTSON, SASCHA. See MUSIC, Artists, Instrumentalists.

CULME-SEYMOUR, Sir MICHAEL. Admiral in the British navy, died at Oundle, England, October 11. He was born at North Church, England, in 1836; educated at Harrow, and entered the navy in 1850. He served in the war with Burma, 1852, in the Baltic, 1864; the Black Sea, 1854-55; the China war, 1858; and was made rear-admiral in 1882. In 1885-87, he was in command of the Pacific squadron, being at that time vice-admiral. Later he was in command of the Channel and Mediterranean squadrons and in 1897-1900 he was commander-in-chief at Portsmouth. As chief naval aide-de-camp, he was conspicuous in the ceremonies connected with the funeral of Queen Victoria.

CUMBERLAND PRESBYTERIAN CHURCH. This denomination was founded in 1810 as a separate presbytery of the Presbyterian Church. The fact that the strength of the church was in the border States, caused much discussion during the Civil War, and the denomination was barely saved from disunion. The question of negro churches resulted in the mutual agreement for the establishment of the Colored Cumberland Presbyterian Church, as affording to the negroes the opportunities they needed most for church development. In 1904 the General Assembly effected a union with the Presbyterian Church in the United States of America, but strong opposition in the Cumberland Presbyterian Church resulted in the formation of a new General Assembly and a legal fight to obtain possession of the church property with varying results.

The 90th meeting of the General Assembly was held at McKenzie, Tenn., on May 20-26, 1920. The 91st meeting will be held about the same date in 1921 at Greenfield, Mo. Reports show that in 1920 there were 1388 congregations with a total of 64,452 members, a decrease since 1916, although not on so large a ratio as between 1906 and 1916. Church property was valued at \$2,022,009. There were a total of 752 ministers. There were about 750 Sunday Schools, with about 5000 officers and teachers. Pupils in 1920 numbered 34,806, a marked decrease from 1916. Young People's Societies numbered 3821. Reports show that the missionary work carried on in this country, and especially among the Indians, is progressing satisfactorily, although hampered by a lack of funds. Missionary work is also being carried on in China, where four churches are maintained with about 600 members. The educational interests of the denomination are represented by the Cumberland College, at Leonard, Texas, and the Cumberland Presbyterian Theological Seminary at McKenzie, Tenn. *The Cumberland Presbyterian*, is published in Nashville, Tenn., and the *Cumberland Banner* is published in Tullahoma, Tenn.

The Cumberland Presbyterian Church (Colored) had, according to the latest available statistics (1916) 136 organizations, 13,077 members, and 132 church edifices. Church property was valued at \$230,426. There were 139 Sunday Schools, with 928 officers and teachers, and 7471 pupils. One school with 250 pupils is main-

tained, and missionary work is carried on in eight States. No foreign missionary work is conducted. Total contributions for missionary and benevolent work in 1916 was \$11,995. *The Colored Cumberland*, a semi-monthly periodical, is published in Milan, Tenn.

CUNLIFFE, WALTER (LORD CUNLIFFE). Governor of the Bank of England from 1913 to 1918, died at Epsom, England, January 6. He was born in 1855, educated at Harrow and at Trinity College, Cambridge, and went into business in London in 1880. Ten years later he established a mercantile banking business and in 1895 became a director in the Bank of England where he was appointed governor in 1913. During the war he was blamed somewhat for the delay in the taking of measures for the improvement of the American exchange in 1915 and for maintaining his increase of the banking rate in July, 1916, beyond the necessary time. He was raised to the peerage in December, 1914. He was known in the United States chiefly as a member of the financial mission of Mr. Balfour in 1917. His term as governor of the Bank of England was longer than that of any of his predecessors, no one before him having served for more than three years.

CUNNINGHAM, Sir HENRY STEWART. British jurist and Indian official, died in London in September. He was born at Harrow in 1832 and educated there and at Oxford where he won the prize for an English essay and he was called to the bar in 1859. In 1866 he became government advocate and legal adviser in the Punjab, India; in 1872 government advocate at Madras. From 1877 to 1887 he was judge of the High Court of Bengal and he returned to England in 1887. He was well known to the general public by his novels on Anglo-Indian subjects, especially for the *Chronicles of Sir Dustypore* (1873) which gained a high place among contemporary Anglo-Indian writings. In 1891 he wrote a volume on Lord Canning in the series of *Rulers of India*; in 1894 a novel entitled *Sybil*; and in 1896 an admirable biography of Lord Bowen.

CURACAO. A colony of the Dutch West Indies with an area of 436 square miles and a population (Dec. 31, 1918) of 57,619 of which 34,639 were on the island of Curacao itself. The colony comprises the islands of Curacao, Bonaire, and Aruba in one group and the islands of St. Martin, St. Eustache, and Saba in another, which is situated about 500 miles to the northeast near the coast of Porto Rico. Part of the island of St. Martin belongs to France. The island of Curacao has one of the best harbors in the West Indies. It produces and exports aloes, divi-divi, and sisal, and it raises for home consumption fruit, corn, vegetables, and herds of goats and sheep. Its chief interest is commerce. The total imports in 1919 were \$2,826,657 of which \$1,744,997 were from the United States. The imports in 1918 were valued at 7,307,823 guilders and the exports at 2,685,828 guilders. The ports of the various islands in 1918 showed an entrance of 3345 vessels of 997,100 tons net. In the 1920 budget revenue was estimated at 1,067,674 guilders and expenditure at 1,647,427 guilders. The government consists of a governor assisted by a council which comprises a vice-president and three members nominated by the crown.

CUREL, FRANÇOIS de. See FRENCH LITERATURE.

CURRENCY. See BANKS AND BANKING; COINS, VALUE OF FOREIGN; FINANCIAL REVIEW; UNITED STATES.

CURTIS, H(ENRY) HOLBROOK. Specialist in throat diseases, died in New York City, May 14. For many years he was one of the leading specialists in that department. He was born in New York City, Dec. 15, 1856, graduated at Yale in 1877, and graduated in medicine in 1880. He was consulting laryngologist at various hospitals and a member of many prominent associations in this country and abroad in the field of laryngology and otology. In 1894 he published a volume entitled, *Voice-Building and Tone-Placing*. He was especially known among actors, singers, and people of other professions that required the use of the voice in public.

CURTIS, M. B. Actor, died at Los Angeles, Cal., December 29. He made a great success in the comedy known as *Samuel of Posen*, which at one time played throughout the entire country, and whose vogue lasted for several years. Twenty-five years before his death, he was arrested on the charge of killing a policeman, and the costs of the trial, which resulted in acquittal, exhausted most of the money that he had earned as an actor. His death occurred at the county hospital.

CYCLING. Both amateur and professional bicycling gained in popular favor during 1920. Arthur Spencer, a Canadian, captured the national sprint championship of the United States, while Robert Spears of Australia was crowned world's sprint champion.

Three six-day races were held in New York City, the first held at Madison Square Garden was won by Alfred Gouillet and Jake Magin. The second contested at the 22d regiment armory was termed an "outlaw" affair in as much as the National Cycling Association refused to sanction it. Many of the leading riders competed nevertheless in defiance of the Association. The winners were Harry Kaiser and Ray Eaton.

The third contest held at Madison Square Garden attracted a field of new cyclists and drew the largest crowds on record. This race was won by Maurice Brocco of Italy and Willie Coburn of Newark, N. J., who stole two laps on the field in the first 24 hours. The national amateur title went to Fred Taylor of the New York A. C.

CZECHO-SLOVAKIA. A republic formed out of Slav regions previously within the limits of the Austro-Hungarian Empire: independence proclaimed Oct. 21, 1918; government organized at Prague, Oct. 28, 1918; formally declared a republic by the National Assembly at Prague, Nov. 14, 1918. See below under *Government and History*.

AREA, POPULATION, ETC. The area has been estimated at 52,000 square miles and the population according to the census of Dec. 31, 1910, was 13,914,336. It comprises Bohemia, with an area of 20,065 and population of 6,769,548; Moravia, 8584, and 2,622,271; Silesia, 1988 and 756,949; Slovakia and Ruthenia, 25,309 and 3,654,435; and the German and Austrian districts assigned by the Peace Conference, 370 and 113,133. At the census of November, 1919, the population of Slovakia was 2,940,374 of whom 2,141,000 were Slovaks, 665,000 Magyars, and 140,322 Germans. The cities over 40,000 with their estimated population on June 30, 1914, are as follows: Prague and environs, 550,000; Brno, 135,-

000; Plzen, 85,000; Pressburg, 85,000; Kosice, 48,000; Ostrava, 42,000; Liberec, 40,000; Usti, 40,000; Bude Jovice, 40,000. The majority are Catholics, but no later figures can be given than those in the preceding issues of the YEAR BOOK under the title of AUSTRIA-HUNGARY, according to which the Roman Catholics numbered 11,836,933; the Greek Catholics, 592,115; and the Protestants 976,567. Educational figures were incomplete, except for the period before the war. Elementary instruction is compulsory between the ages of 6 to 14. Before the war there were 13,638 elementary schools with 2,032,313 pupils and 1021 advanced public schools with 172,607 pupils. Slovakia in 1918-19 had 3931 elementary schools with 390,764 pupils. There were 216 gymnasia and other schools for secondary education. There are four universities, two of which are at Prague, the other two being respectively at Brno and Pressburg. One of the universities at Prague is Czech (teaching staff 116; students 7051), and the other is German (teaching staff 113; students 3043). The university at Brna (Czech) had 15 teachers and 490 students and the university at Pressburg (Slovak) had nine teachers and 124 students. At Prague and also at Brno there are two technical high schools, respectively Czech and German.

PRODUCTION. The territory in respect to natural resources is one of the richest in Europe and is far advanced in industrial development. Of the total population the largest element is engaged in the industries and next to that in agriculture. The average annual harvest has been valued at 1,250,000,000 kronen. There is a very large fruit export. Stock-raising flourishes, and there are well developed industries connected with agriculture, such as sugar-refining and the beer and spirit industries. The minerals include gold, silver, copper, iron, coal, antimony, etc. The factories in 1919 numbered 8833 of which 2000 were engaged in the manufacture of textiles; 1755 glass and precious stones; 1355 food manufacture. See AGRICULTURE.

FINANCE. In 1920 the budget estimates were: Revenue, 5,323,582,000 kronen, ordinary, and 2,427,188,000 extraordinary, making a total of 7,750,770,000; expenditures, 4,926,691,000 ordinary, and 5,489,484,000 extraordinary, making a total of 10,416,175,000. The finance minister on Oct. 25, 1920, submitted to the National Assembly a bill containing a statement of probable revenue and expenditure and of financial proposals for the fiscal year commencing Jan. 2, 1921. While the appropriations are for the third year of the Republic's existence, an even balance in current government receipts and disbursements has already been achieved, the first amounting to 14,107,979,550 and the latter to 14,104,374,650 crowns (Czecho-Slovak crown = \$0.202 at par of exchange; the present exchange value is about \$0.0125).

RAILWAYS. In 1919 the railway mileage was 8680 of which 7850 was state railways. The following information was supplied by the United States Bureau of Foreign and Domestic Commerce: The Bohemian, Moravian, and Silesian net of railways was constructed as an integral part of the railways of old Austria at a time when, for political reasons, all the trade was directed to the centre of the Empire, Vienna—that is, from north to south. The rigid centralistic Austrian system did not allow any devia-

tion with regard to the main traffic routes. It was also a policy of the Austrian and Hungarian governments to separate Slovakia from its kindred countries, Bohemia and Moravia, and firmly to bind it by a net of railways to the centre of Hungary. The old government, therefore, constructed railway lines extending to Budapest, from north to south, and only here and there were tracks built in a different way, but without any connection between them, the only aim being to increase the traffic toward the Magyar centre. Under the empire the railroads in Bohemia, Moravia, and Silesia were systematically neglected and during the war very poorly maintained, so that in 1920 they were in a very bad condition. Moreover, the railways in Slovakia had many lines of local railways with a weak superstructure, which did not allow their use for all the rolling stock and especially locomotives, whereby the entire traffic was very much hampered. In the Czecho-Slovak Republic there was a change in regard to the direction of our commercial policy, i.e., in favor of a west-to-east direction. It was therefore an important task to prepare the net of railways in such a way as to accomplish the connection of Moravia with the north, the centre, and the south of Slovakia, and to construct in Slovakia itself a transverse main line to Rusinia (Podkarpatska Rus), to which it would be possible to join a further net of railways.

GOVERNMENT. After the National Assembly declared the new state to be a republic with Prof. Thomas G. Masaryk as its first president (Nov. 14, 1918), it proceeded to the work of forming a constitution and preparing for a general election. The constitution was adopted Feb. 29, 1920, and the general election was fixed for April, 1920. Under the constitution the new state is a democratic republic with an elected president, the territory under it forming a single unit. The president is the commander-in-chief of the armed forces, has the power of appointment for the higher officials and acts through a responsible ministry. He is elected by the national parliament for seven years. The legislative power is vested in the national parliament which consists of a chamber of deputies of 300 members elected for six years and the senate of 150 members, renewed every eight years. Freedom of speech and of the press, the protection of racial minorities, etc., are guaranteed by the constitution. There is universal adult suffrage without distinction of sex and all citizens over the age of 30 are eligible for office. The official language is Czecho-Slovak, but it is provided that a minority in any district numbering over 20 per cent of the population may choose its own official language and have its own schools. The principle of proportional representation is observed. The president in 1920 was Professor T. G. Masaryk. At the beginning of 1920 the ministry, constituted July 8, 1919, under Tusar (Social Democrat), as Prime Minister, was in power.

HISTORY

ELECTIONS. The National Constituent Assembly had completed its work and dissolved April 15. On April 18 the elections were held for the chamber of deputies and on April 26 for the senate. The votes by nationalities were as follows: Czechs, 4,203,480, electing 199

deputies; Germans, 1,576,692, electing 72 deputies; Magyars, 274,630, electing 10 deputies. The distribution of seats among the political groups of the respective nationalities was as follows: (1) Czechs: Social Democrats, 74; Clericals or Peoples Party, 33; Agrarians, 28; Czecho-Socialists, 24; National Democrats, 19; Peasants, 12; Traders Party, 6; Progressive Socialists, 3. (2) German: Social Democrats, 31; German Electors' Union, 15; Farmers' Union, 11; German Christian Socialists, 10; German Liberals, 5. (3) Magyars: Magyar Christian Socialists, 5; Magyar Social Democrats, 4; Agrarians, 1. Dr. Masaryk was chosen president by a vote of 284 to 61 upon the meeting of the new parliament. The Tusar ministry had resigned after the close of the National Constituent Assembly and a new ministry was now appointed. M. Tusar was again named as prime minister. This ministry resigned, September 15.

NEW MINISTRY. The new ministry was composed as follows: Premier and Minister of Interior, Jan Cerny, head of the provincial government of Moravia; Minister of Defense, General Husak; Minister of Posts, Dr. Fodka; Minister of Agriculture, Dr. Brdlik; Minister of Railroads, Dr. Burger; Minister of Public Welfare, Dr. Gruber; Minister of Unification, Dr. Fajnor; Minister of Food, Mr. Prusa; Minister of Public Health, Dr. Prohaska; Minister of Foreign Affairs, Dr. Benes; Minister of Finance, Dr. Englis; Minister of Education, Dr. Susta; Minister of Justice, Dr. Popelka; Minister of Commerce, Mr. Hotosek.

The fall of the Tusar ministry was followed by a division in the ranks of the Social Democrats, a portion of whom, comprising the leaders of the party, refused to accept the programme of the Third International, saying that the principles of social democracy and those of Communism as understood in Moscow were so sharply contrasted that it was useless to try to reconcile them. Thereupon, the radical element in the party withdrew and at the same time took possession of the party newspaper. The Conservative element, however, opened a separate office for the newspaper, which thereafter was published in two separate editions, representing the respective Right and Left wings of the party. The new prime minister was a member of the National Democratic party and his ministry was regarded as a non-political government, consisting of administrative experts.

FOREIGN RELATIONS. The prime minister, Czerny, toward the close of the year condemned the agitation in Hungary on behalf of the Hungarian element in Czecho-Slovakia if the reports in the press were correct. He declared that if good relations did not exist between the two countries, it was not the fault of his own and that he would energetically ward off any attacks upon the integrity of Czecho-Slovakia. The press reports to which he referred indicated a well organized irredentist movement in the Hungarian portions of the new state. The foreign ministry declared that the press reports had been fully established. Serious disturbances were reported in the old kingdom of Bohemia in the middle of November where riots broke out as a result of Pan-German demonstrations. In Prague, there were anti-Czech demonstrations on the part of the Germans. This provoked attacks by the Czechs and mobs destroyed a considerable amount of German property. There were anti-

Semitic riots in the German university of Brönn. The foreign ministry in November announced that the Russian Soviet government had offered a secret military and political alliance and that it had been refused.

SOCIAL DEMOCRATS. Toward the close of the year the Social Democratic party in conference declared that it would coöperate in the work of parliament and submit measures of a Social Democratic character, but would decline to take part in any coalition of parliamentary groups. In foreign relations it demanded a policy of peace and friendship with all neighboring countries: strict neutrality as between Poland and Russia: and resumption of diplomatic relations with the Soviet government.

DADAISM. See FRENCH LITERATURE.

DAHOMÉY. A French colony of West Africa between Togoland on the west and the British possessions of Lagos and Nigeria on the east and with the French military territories on the north. It is part of the government-general of French West Africa (q.v.). There are only about 70 miles of coast land. The population in 1918 was estimated at 900,000 including 480 Europeans. The natives are of pure negro blood and belong to the Ewe family. They are for the most part fetish worshippers, but are industrious farm workers along the coast where they grow corn, yams, potatoes and manioc. The capital and chief business centre is Porto Novo with about 20,000 inhabitants. The other towns of importance are: Abomey (12,372); Whydah or Ouida (13,000); Grand Popo (2115); Kotonou (2456). The chief imports are cotton, machinery, tobacco, and liquors; the chief exports, corn, palm kernels and palm oil. In the central part cotton cultivation is successfully carried on. In 1914 the exports of palm kernels amounted to 12,189,239 francs and the exports of palm oil to 13,690,478 francs. There is a railway from Kotonou into the interior as far as Savi, a distance of 156 miles, which has a branch line to Whydah, and its prolongation to Chaoru, a distance of 400 miles, is projected. There are 1389 miles of telegraph. The budget for 1919 was given at 5,921,000 francs.

The foreign trade showed a marked advance in 1919, the total being \$22,096,114, as against \$11,258,413, in the year before. The exports amounted to \$13,530,170 and the imports to \$8,566,244. The chief imports in respect to value were cotton goods, and tobacco; and the chief exports, corn, palm kernels, and palm oil. In percentage of the total value of foreign trade distributed among the leading nations in 1919 was as follows: Great Britain, 30 per cent; France, 29.6 per cent, and the United States, 12.5 per cent. The shipping figures for the port of Dahomey in 1919 were as follows: Tonnage entered, 259,887; cleared, 277,003.

DAIRYING. PRODUCTION AND PRICES. For the first nine months of the year, production and price of dairy products continued about the same as during 1919. Although exports had decreased and imports were coming in greater quantities, the actual effect of this situation was not felt until about October of 1920. Prices for butter and condensed milk remained about the same as the year before, while cheese was inactive during considerable part of the year.

The following table gives the production of butter, cheese, and condensed milk for the fiscal years 1919 and 1920. Cheese production re-

mained about the same, while butter decreased and condensed milk increased.

	1919 (pounds)	1920 (pounds)
Creamery butter	852,312,500	744,262,058
American cheese	272,791,283	270,898,862
Condensed and evapor. milk	1,871,658,452	2,244,392,769

On the first of October, the combined effect of several factors greatly upset the whole industry and marked decreases in the prices of butter and condensed milk soon followed. Several factors contributed to this adverse condition.

During 1919 an enormous export trade in butter and condensed milk had been built up. More butter and more condensed milk were imported, by far, than at any time in the history of the country. During this year, however, foreign credits expired and the adverse exchange situation discouraged our export trade and encouraged imports. With butter, for instance, the greatest export year, 1919, was followed by the greatest year of imports, while condensed milk dropped from the high point of 114 million pounds in the month of June last year, to 17 million pounds in November of 1920. Production in the latter product had continued at the normal rate, and the enormous accumulation was responsible for the closing down of many of the condensaries on October 1st. Some of the plants continued to operate, but all milk was received on account of the producers who were obliged to deliver their milk to the factories and accept the returns for the product in whatever form it was manufactured, less the actual cost of manufacture. Some of the milk formerly used for condensed milk was converted into cheese, while a larger amount of it was made into butter and, in many cases, the skim milk was not utilized.

Milk powder plants were similarly affected because of the surplus of that product and this contributed its share of discouragement to the producer. A very large drop in the price of sugar about this time was also a serious factor in the condensed milk business. In some sections, notably in the Eastern and New England States, the milk producers' organizations are attempting to contract for all of the milk of producers and form a pool, so that the producer will receive a similar price whether the milk goes to the cities for direct consumption or whether it is made into various products.

The producers' price for milk for direct consumption to the cities did not react so quickly to the decreases in price, although it is already considerably lower than the cost in the winter months of last year. The price of retail milk in the cities has not increased for the winter months as it usually does, and in some cases has decreased one to three cents a quart. It is fortunate that with this material decrease in price of milk there has also been a decrease in the price of feeds for dairy animals. Both hays and concentrated feeds have decreased 30 to 50 per cent, and in some cases more, below the prevailing prices of a year ago.

FOREIGN TRADE IN DAIRY PRODUCTS. The production of dairy products in this country is enormous, but normally it is all consumed at home. During the war, however, production was stimulated by the increased prices and the outlet to foreign countries. The outlet, although comparatively small, except in the case of condensed milk, as compared with total production, had

a stabilizing effect upon the price. As has been pointed out, during the past year this outlet was stopped and imports increased. Although the actual quantity imported was small compared with our total production, yet it has had a serious effect upon the situation, because instead of foreign trade being a stimulus to the price, importations have seriously upset the markets. During 1920 more butter was imported into the United States than at any time in the history of the country, reaching as high as over eight million pounds in the month of July.

The following table shows the foreign trade in dairy products for the fiscal years 1919 and 1920.

	Imports	Exports
Butter:		
1919 (fiscal year)	4,131,469	33,740,360
1920 " "	20,770,959	27,129,834
Cheese:		
1919 (fiscal year)	2,437,871	18,794,455
1920 " "	17,913,682	19,427,300
Condensed and evaporated milk:		
1919 (fiscal year)	20,183,623	730,119,710
1920 " "	19,080,642	707,847,328

The reversal in trade has been brought about, largely by the decreased buying of the United Kingdom, France, and Belgium. The chief buyers at the present time of condensed and evaporated milk are Germany, Cuba, Belgium, and the United Kingdom, and because of the inability of Germany to buy much butter from Denmark, and because of the great decrease in consumption of butter in England, considerable quantities of the butter that is being imported into this country now comes from Denmark, although there have been considerable quantities from Canada, Argentina, and New Zealand.

TARIFF. Since the reverse in trade in dairy products, there has been much agitation among the various dairy organizations in this country to have the tariff revised. Before 1914, the tariff on dairy products largely prohibited importations except for some condensed milk and some special foreign varieties of cheese. In that year, however, the tariff was reduced and large importations came, but the war having started in August of that year destroyed the effect of the low tariff. The tariff on butter was reduced from six cents a pound to two and a half cents; cheese from six cents a pound to 20 per cent ad valorem; while condensed milk was changed from two cents a pound to the free list.

EXPERIMENTAL WORK. Progress has been made during the year in problems relating to the feeding of dairy cows. Considerable additional information has been made available by studies in the mineral requirements for milk production. It has been demonstrated that the lack of sufficient calcium and phosphorous are often limiting factors in the amount of milk that is produced. It has been shown that the subsequent production of a cow can be largely increased by liberal feeding over a comparatively long period before calving, or by feeding of mineral salts during a shorter period before freshening, and that this is especially true of cows not heavily fed during the lactation period. Progress has also been made in the studies of various proteins commonly fed to dairy animals. Much greater usefulness of some forms has been demonstrated.

The large breeding project which is being conducted by the Federal government in co-

operation with many of the States has been enlarged, and during the year the studies of the principle of inbreeding, as compared with outcrossing, have been added to the problems for investigation.

The work on products during the year has been increased along the lines of studies in the quality of milk for the manufacture of products. It has been demonstrated that the quality of the milk is of greatest importance in the manufacture of certain varieties of cheese and condensed milk.

It has been especially observed that there are special forms of organisms that produce rennet and that their by-product may be a larger factor than the acid forms, especially in connection with the coagulation of milk for the making of evaporated products.

The utilization of milk in the form of various by-products has continued, and a process for making albumen powder from whey has been devised. The manufacturing work with butter and cheese has had considerable attention by the various States and the Federal government, and these studies have largely been along lines of management and plant efficiency, while causes and prevention of mold in butter have received additional attention.

MILK CONSUMPTION. The city campaigns that were so successful last year in increasing the consumption of milk in the cities during the past year have been extended to the country, for it was found that in some sections, especially in the South, a large percentage of the farm families had no milk. An out-growth of the campaign in the South was the slogan, "At least one cow on every farm." The result of this campaign has been very marked and in some counties hundreds of dairy cattle have been brought in and distributed among small farms. The campaigns for increased consumption have been conducted by the various States and cities, and have usually been cooperated in by the women's organizations, public health committees, and others directly interested in child welfare work, especially. The National Dairy Council, an organization for spreading the gospel of milk consumption, has been considerably enlarged during the year, and increased numbers of specialists have been employed for the purpose of carrying on campaigns and for the distribution of information along the lines of consumption of dairy products. Some 10 or 12 State organizations have been formed and many of them affiliated with the national organization.

Reports from cities indicate that the consumption of milk has increased considerably during the past year.

PUBLICATIONS. The following are among the books on dairying that have been published during the year:

Heinemann, Paul Gustav. *Milk*. Philadelphia, W. B. Saunders Company, 1919.

King, Clyde L. *The Price of Milk*. Philadelphia, John C. Winston Company, 1920.

Hunziker, Otto Fred. *The Butter Industry*. Published by the author, LaGrange, Ill., 1920.

Hunziker, Otto Fred. *Condensed Milk and Milk Powder*. 3d edition. Published by the author, LaGrange, Ill., 1920.

DALMATIA. Before the downfall of the Austro-Hungarian monarchy, a crownland of Austria; after the revolution of November, 1918, a constituent part of the new state of Yugoslavia. It is bounded by Bosnia and Her-

zegovina on the east and the Adriatic Sea on the west and it lies between Croatia and Montenegro. Area, 4952 square miles; population on Dec. 31, 1910, 645,666. Its population in the new state of Jugo-Slavia was given at 945,666, but certain of its territories were in dispute with Italy. (See WAR OF THE NATIONS). While it was a part of the Austro-Hungarian area, the Croat-speaking element was placed at the census of 1910 at 610,669 and the Catholics numbered 539,074 as against 105,338 Orthodox Greeks. Capital, Zara, with a population of about 14,000. Other important towns: Spalato (about 21,000); Ragusa (about 9000); and Cattaro (about 3000); all of which are seaports.

DALTON, Sir CORNELIUS. British patent office official, died in London, England, in October. He was born March, 1842, and was educated at Trinity college, Cambridge, where he took honors. He studied law and entered the civil service in 1873 and was a member of important commissions on taxation, etc. From 1897-1900 he was Controller-General of Patents. Among his publications may be mentioned: *The Real Captain Kidd* (1911), and *The Life of Thomas Pitt* (1915).

DAMS. A review of engineering literature in 1920 would probably reveal that more attention was being paid to earth fill dams than those of other types. This followed from the fact that for most of the project this form of construction was most suitable, yet obviously where there are gorges or narrow river beds the masonry dam must be employed with ingenious and well organized methods for depositing the concrete.

MIAMI CONSERVANCY DAMS. The important work of the Miami Conservancy District (See FLOOD PROTECTION) involved the construction of five dams formed by earthen embankments pierced by outlets of concrete masonry. These dams varied in volume from 865,000 cubic yards to 3,500,000 cubic yards, and aggregate some 9,000,000 cubic yards of fill. They were all being built by the hydraulic method and not only did the work rank as the largest hydraulic fill dam construction ever undertaken, but in its prosecution mechanical and technical advances beyond anything ever recorded in this field were attained. In most of the construction, in all except the dam at Germantown, the dams consisted of wide, flat fills across broad level valleys. The work was most carefully organized and its prosecution involved the essential elements of stream control. Borrow-pit development and materials transportation, pump construction and operation, discharge pipe construction, and embankment building. In the construction of the dams at Taylorsville, Huffman and Lockington where the outlets were concrete notches in the embankments, by leaving out the wire crossing the notch a flume was obtained adequate to pass the floods during the construction. The dams at Englewood and Germantown were continuous embankments across the valleys and the outlets were twin conduits passing through the bottom of the fill. During the construction period these were enlarged to about twice their final capacity. The Germantown dam, the first of the five dams to be completed was finished during the year, and in 1921 would be ready to act by exerting its full detention in place of the enlarged conduits just referred to used for flood water in 1920. The Germantown dam is 110 feet high, containing about 900,000 cubic yards of embankment.

BRIDGEWATER PROJECT. In the autumn of 1919 the new Bridgewater reservoir of the Western Carolina Power Co., to impound the waters of the Catawba River and its tributaries was practically completed. This as described in the YEAR BOOK for 1917 (See DAMS, page 187), involved three dams known respectively as the Catawba, Paddy Creek, and Linville dams. The Catawba for its section crossing the river was of the gravel concrete type, but the remaining section as well as the other two dams were earth fills formed by hydraulic sluicing of earth brought up in trains and deposited along the outer edges of the dam from timber trestles. These three earth fill dams were of approximately the same design, with a top 20 feet wide, upstream slopes of one on three and downstream slopes of one on two and one half. There was a central bottom trench and a downstream low rockfill toe wall. The Catawba dam was 120 feet high and contains about 1,820,000 cubic yards. Paddy Creek dam had 160 feet maximum height with 1,450,000 cubic yards, and Linville was 160 feet high with 1,250,000 cubic yards total fill. The different dams were located within 2½ miles of each other and the material used in building them was of essentially the same nature and composition.

At the Catawba dam there is a spillway of masonry 305 feet long across the river bed and the earthfill, this spillway rising to a height of 125 feet. This spillway through its extensions is tied into the earthfill, there being a concrete core wall with seven fins. The top is crossed by a public highway with two 153 feet long steel spans supported by a central pier, making a bridge over the spillway. The entire project is fully discussed in the *Engineering News-Record*, vol. 84, No. 28, p. 1088, and vol. 85, No. 7, p. 306.

BIG EDDY DAM. The Big Eddy dam across the Spanish River near High Falls, Ont., was completed during the year and provided a regulating reservoir for a power plant of the International Nickel Co., located about ¾ of a mile downstream. The structure was of mass concrete section with a maximum height of 159 feet and a length of 1100 feet, 512 feet of which was in comparatively low bulkhead. There was a penstock section, 152 feet in length and the remainder was spillway. The site of the dam is at a narrow gorge of the river which was closed by sinking four pneumatic caissons, two upstream and two downstream. To take care of the river discharge a flume was excavated through a slight depression behind the east bank of the river involving the removal of 14,000 cubic yards of rock which later was used in the concrete structure of the dam proper. As the dam grew in height the flume was roofed over at a height of 42 feet above the floor.

DEVILS GATE DAM. The Devils Gate concrete arch dam, near Pasadena, California, was dedicated on Aug. 18, 1920. This was one of the structures built by the Los Angeles County Flood Control District, and was located in the deep gorge of the Arroyo Seco. It has a maximum height of 120 feet above bed rock and is about 310 feet in length on the crest. It is of the single arch type and carries across its crest a highway. It is a concrete structure comprising some 30,000 cubic yards of concrete, which was mixed and placed at the very good rate of 300 cubic yards per 8-hour shift. About 75 per cent of the total amount was poured from the

mixer directly into the dam, and the material to mix with the cement was found near the dam site.

WANAQUE DAM. The North Jersey District Water Supply Commission on Nov. 9, 1920, let a contract for the construction of a portion of the Wanaque Dam. This was to be an earth dam whose construction would create an impounding reservoir of 11,000,000,000 gallons capacity on the Wanaque River. The plans involved a concrete and puddle core wall, 970 feet long, excavated from the ground surface to bed rock by means of a sheeted trench 100 feet or more in depth. The contract referred to called for the construction of the concrete and clay puddle core-wall from bed rock to the surface of the ground, excavation of a channel in rock, removal of existing mill buildings, and erection of miscellaneous structures. The work contemplated 83,500 cubic yards of earth excavation, 16,000 cubic yards of rock excavation, 8000 cubic yards of clay puddle, 28,500 cubic yards of concrete, and 100 tons of sheetpiling. The letting of the contract was interesting in view of industrial conditions during the year as the work was to be done on a cost-plus-a-percentage basis, the contractor to share in any reduction in unit costs up to a certain per cent, or to bear a share of added expense through an increase in cost of materials and wages. It was provided, however, that no matter what the expense of the work might be, the contractor was assured of a 4 per cent fee. In this connection a straight unit price bid was tendered by a responsible contractor which was under the engineers' estimates, but this was rejected by the commission in view of a probable fall in the costs of materials and labor, which would make the cost plus plan advantageous.

SPAULDING DAM. An interesting project described in the *Engineering Press* of 1920, though completed in the previous year, was the raising by an addition of 15 feet in height and backing up to secure increased strength, of the Lake Spaulding Dam of the Pacific Gas and Electric Co., of California. This lake is situated in Nevada County, being formed by impounding the water of the South Fork of the Yuba River. The main dam which since the addition rises to a height of 275 feet above the river bed is flanked by five smaller dams and a storage of 74,000 acre feet is provided. The original dam built in 1913 and described in the *YEAR BOOK* for that year (page 199), was designed for a height of 305 feet, and was first built up to a height of 225 feet with foundation adequate for the ultimate completion. In 1916 the dam was raised to 260 feet, and the 1920 addition of 15 feet probably represented the final work as further storage could be secured more economically elsewhere in the water shed.

The addition made in 1920 involved the continuing of the upstream and downstream bottles which were three feet and 16 feet in 100 feet respectively. The crest was 11 feet in width. The improvement also involved the reinforcement of the downstream face of the arch section. The undertaking presented unusual problems dealing with the shrinkage of concrete and adaptation of new to old construction. Dam 2 in the project is the spillway dam with a spill crest five feet deep and 270 feet long with six-inch I-beam posts at six foot centres to support wooden flash boards and a walkway. This dam which was arched

with a radius of 300 feet was made by backing up the old section. Dams 3, 4, and 5 were raised and connected so as to form a continuous dam, reinforcing by buttresses and other backing being introduced. The water stored at this dam is passed through a series of four power houses with an aggregate head of 2430 feet and then is used for irrigation purposes. The project outlined is described in *Engineering News-Record*, vol. 85, No. 22, page 1020.

KERKHOFF DAM. This concrete dam across the San Joaquin Valley, California, completed at the beginning of the year was marked by a notable system of construction. It was built of concrete from a superposed trestle which was erected complete before starting construction work, and its frame work not only served for the tracks of the cars from which the concrete was chuted down to the dam construction, but also as a backing for the concrete forms. The dam was 108 feet high with a radius of 205 feet in the upstream face.

WARM SPRINGS DAM. A similar method of construction was used successfully on the Warm Springs Dam, a thin arch dam on the Malheur River, in Eastern Oregon, built to impound 170,000 acre-feet of water for irrigation. This dam was 549 feet in length at the top, 469 feet along the curved portion, and 200 feet at the bottom. The width at the top was eight feet and at the bottom 27.24 feet. There was a spillway 324 in length with a free board of 8 feet.

PROPOSED MERCED RIVER DAM. An interesting project of the year was included in a report on the requirements of the Merced irrigation district in the San Joaquin valley of California. The district contemplates the irrigation of 200,000 acres of fertile land, of which 52,000 acres was already irrigated. The report recommended a storage reservoir on the Merced River formed by a dam at Exchequer, 7 miles above Merced Falls, where a simple arch dam of perhaps 330 feet total height, could be constructed which would raise the water 300 feet and form a reservoir 12 miles long. Such a flooding would necessitate the relocation of 20 miles of the Yosemite Valley railroad which ran through the reservoir site. It was also proposed to locate a 20,000-kw. power plant at the foot of the dam, part of the energy from which would be used for pumping within the district. The plans further contemplated the purchase of the Crocker-Huffman canal system and the addition of mains and laterals to make a total length of about 850 miles of irrigation canal.

THE SEVERN RIVER BARRAGE. As an essential element of the big tidal power project which was announced in England late in the year, there was a reinforced concrete dam across the River Severn below Chepstow. Here there was an exceptionally high range of tide and an estuary of large capacity so it was proposed to build a dam across the river to retain the water coming up at flood tide and to use the energy thus stored in turbo-generators below the dam. The available head of water would range from 5 to 30 feet. The project also involved the development of a high level lake by constructing a dam across a valley leading from the Wye Valley just above Tintern Abbey. This lake would serve as a reservoir into which the tidal water of the basin would be pumped during the periods of surplus energy, and this would be drawn upon to operate other turbines during the inactive periods at

the main dam so as to maintain a constant supply of power. The power features of the scheme naturally were of unusual interest and received the favorable and other criticism of engineers on their announcement. The main dam or barrage, however, did not present any striking engineering difficulties as the Severn at the point of crossing was about $2\frac{1}{2}$ miles wide with low lying country on both sides. The greater part of the river bed was exposed at low water and in the centre there was a deep channel known as "The Shoots." At the dam or barrage it was proposed to build a level roadway along the crest and also provide new trackage for the Great Western Railway Co.'s line between the West of England and Wales. The barrage would also provide a locked basin for shipping purposes of over 27 square miles, much of which would be able to accommodate ocean going vessels and be usable at all stages of tide. The scheme was most ambitious having an important bearing on various industrial developments in this region, but it must be said that the entire project proposed by the Ministry of Transport, planned by Sir Alexander Gibbs, J. Ferguson, and T. R. Menzies, and estimated to cost between \$40,000,000 and \$150,000,000, was regarded by many as idealistic and impracticable. It was fully discussed in the *Engineer* (London), issue of Dec. 3, 1920.

PROPOSED BHAKRA DAM. During the year what was stated would be the highest dam in the world was under discussion for construction across the Sutlej River, India, in the Bhakra Gorge, some 40 miles above Rupar, the head-works of the existing Sirhind Canal. This Bhakra Dam as designed would be 395 feet high from foundation level to roadway, with a depth of water in front of the dam of about 375 feet. The length of the top of the dam was to be 1015 feet. The water to be stored by the dam in the month of August annually would amount to 2,500,000 acre-feet.

DANER, WILLIAM FRANKLIN. Judge, died at Newton, Mass., August 5. He was born at Somerville, Mass., June 26, 1863, graduated at Harvard in 1884, and practiced law in Boston until 1906. Meanwhile he had served on the Board of Aldermen in that city and in the State Senate of which he was president for three years. In 1906 he was made a justice of the Supreme Court of Massachusetts. He wrote largely for magazines on legal and historical subjects.

DANISH LITERATURE. See SCANDINAVIA.

DANZIG. A free state, as constituted by the Treaty of Versailles in 1919, formerly belonging to Germany. Area, about 579 square miles; population of the state proper in 1919, 182,468; estimated population of the district about 200,000. According to the German census of 1910, the population of the state was 170,337. The shipping of 1918 showed a very heavy falling off—more than one-half since 1913. About 50 per cent of the tonnage was German, the remainder being generally Norwegian, British, Swedish, and Danish. Article 102 of the Treaty provided for the establishment of the city of Danzig along with its surrounding territories as a free state under the protection of the League of Nations and the drawing up of a constitution under the auspices of the League. The League of Nations provided for its administration by

the appointment of a High Commissioner, this office being held in 1920 by Sir Reginald Tower. A constituent assembly was to be held and named and meanwhile the High Commissioner appointed a state council of three (March 5, 1920). Provision was made for a legislative body of 90 members elected by universal suffrage without distinction of sex for all persons 20 years of age and upwards who had resided in the state after Jan. 1, 1919. The principle of proportional representation is observed.

DARTMOUTH COLLEGE. A non-sectarian institution of higher learning at Hanover, N. H., founded in 1769. In the fall of 1920 there were 1818 undergraduates and 70 graduates enrolled. The faculty contained 156 teachers. The endowment amounted to \$5,000,000 and the library contained about 150,000 volumes. During the year a new dormitory known as Topliff Hall and the Spalding swimming pool were opened, and work on the new chemical laboratory was begun. President, Ernest Martin Hopkins, Litt. D., LL.D.

DAVIS, JOHN MOORE KELSO. Brigadier-general United States army, died at Hartford, Conn., May 20. He was born at Washington, D. C., Jan. 31, 1844, served as a volunteer in the Civil War and graduated from the United States Military Academy in 1867, after which he served in the artillery in the regular army. He was made brigadier-general May 25, 1907, and for the next seven months was in command of the Department of the Gulf when he was retired.

DAVIES, JULIEN TAPPAN. Lawyer, died in New York City, May 6. He was born in New York City Sept. 25, 1845, served in the Civil War, taking part in the Gettysburg campaign and graduated at Columbia College in 1866. He studied law and was admitted to the bar in 1867. He was council for the New York Elevated Railways and the Manhattan Railway Company from 1884-1914 and was a director of important financial institutions. In 1886 he compiled the statutes and decisions of New York State relating to Taxation.

DAY, WILLIAM PLUMBER. Rear-admiral, United States navy, died at Nice, France, January 4. He was born in New York City Sept. 30, 1848, and graduated at the United States Naval Academy in 1869. He rose to the rank of commander, Dec. 12, 1899, and captain, Jan. 12, 1905, and was retired soon afterwards (June 11, 1906) with the rank of rear-admiral. He had meanwhile served on many ships including the *Vixen*, of which he was in command 1890-1900, and the *Mohican*, 1902-04. In 1904-05 he had charge of lighthouse inspection in the 12th district and in 1905-06 of the navy-yard at Mare Island, Cal.

DEATH RATE. See VITAL STATISTICS.

DELAWARE. POPULATION. According to the preliminary report of the census of 1920, there were 223,003 residents in the State, Jan. 1, 1920, as compared with 202,322 in 1910.

AGRICULTURE. According to the census of 1920, the number of farms was 10,128, a falling off of 6.5 per cent since 1910. The following table is compiled from the estimates of the United States Department of Agriculture, covering the years 1919 and 1920:

Crop	Year	Acreage	Prod., bu.	Value
Corn	1920	190,000	7,125,000	\$5,344,000
	1919	195,000	5,850,000	8,482,000
Wheat	1920	120,000	2,040,000	3,488,000
	1919	130,000	1,560,000	3,323,000

Hay	1920	91,000	*128,000	2,700,000
	1919	87,000	*112,000	2,870,000
Potatoes	1920	11,000	1,166,000	1,166,000
	1919	12,000	996,000	1,245,000
Sweet potatoes	1920	8,000	1,024,000	1,024,000
Bales.				

MANUFACTURES. A preliminary statement of the general results of the census of manufactures for the State showed a consistent increase at the census of 1919, as compared with that for 1914, except that the number of establishments decreased from 808 in 1914 to 664 in 1919, and the number of proprietors and firm members from 735 in 1914 to 592 in 1919. In the order of their importance from a percentage standpoint, the increases for the several items rank as follows: Value added by manufacture, 226.1 per cent; wages, 223.8 per cent; value of products, 194.5 per cent; materials, 170.1 per cent; salaries, 126.1 per cent; capital, 113.6 per cent; wage earners, 30.5 per cent; primary horsepower, 29.9 per cent; and salaried employees, 26.5 per cent. The capital invested, as reported in 1919, showed a gain of \$78,721,000, or 113.6 per cent, over that in 1914. The average capital per establishment was approximately \$223,000 in 1919 and \$86,000 in 1914. The cost of materials used in 1919 showed an increase over that for 1914 of \$53,825,000 or 170.1 per cent. The average cost of materials per establishment in 1919 was approximately \$129,000, and in 1914, \$39,000. In addition to the component materials which enter into the value of products, the cost of materials in this summary includes the cost of fuel, mill supplies, and rent of power and heat. The value of products in 1919 showed an increase over that in 1914 of \$108,964,000, or 194.5 per cent. The average per establishment in 1919 was approximately \$248,000 and in 1914 \$69,000. The value added by manufacture represents the difference between the cost of materials used and the value of the products manufactured from them. The value added by manufacture in 1919 showed an increase over that in 1914 of \$55,139,000, or 226.1 per cent. The value added by manufacture in 1919 formed 48.2 per cent of the total value of products and in 1914 43.5 per cent. In 1919, as compared with 1914, the number of salaried employees showed an increase of 701, or 26.5 per cent, while the average number of wage earners increased 6767 or 30.5 per cent. A comparative summary for the State for 1914 and 1919 follows:

	Census		Per cent of increase 1914 1919 ^a
	1919	1914	
Number of establishments	664	808	-17.8
Persons engaged in manufactures	32,858	25,533	28.7
Proprietors and firm members	592	735	-19.5
Salaried employees	3,944	2,643	26.5
Wage earners (average number)	28,922	22,155	30.5
Primary horsepower	83,669	64,403	29.9
Capital	\$148,045,000	\$69,324,000	113.6
Services	44,541,000	14,782,000	201.3
Salaries	7,689,000	3,400,000	126.1
Wages	36,852,000	11,382,000	223.8
Materials	85,474,000	31,649,000	170.1
Value of products	164,999,000	56,035,000	194.5
Value added by manufacture (value of products less cost of materials)	79,525,000	24,386,000	226.1

a A minus sign (—) denotes decrease.

EDUCATION. The school laws were revised and a new school code was enacted by the Legislature, introducing important modifications in the system.

FINANCE. The total balance at the close of

the fiscal year 1919 was \$1,530,772. The cash receipts for the general fund during 1919 were \$3,259,722, and the expenditures \$2,425,681. The outstanding indebtedness of the State on Jan. 12, 1920, was \$2,066,785.

ELECTIONS. The vote for the presidential elections of 1920 was as follows: Harding (Republican), 52,858; Cox (Democrat), 39,897; Debs (Socialist), 1002; Watkins (Prohibitionist), 998; as compared with the following vote in the presidential election in 1916: Hughes (Republican), 26,011; Wilson (Democrat), 24,753. The vote for governor in 1920 was as follows: Denney (Republican), 51,895; Lynch (Democrat), 41,638.

OFFICERS. Governor, William D. Denney; Lieutenant-Governor, J. Danforth Bush; Secretary of State, Everett C. Johnson; Attorney-General, Sylvester D. Townsend, Jr.; Treasurer, George M. Fisher; Auditor, Daniel Thompson; and Commissioner of Insurance and Banking, Horace Sudler.

JUDICIARY. Chancellor, Charles M. Curtis; Chief Justice, James Pennewill; Associate Justices, Herbert L. Rice, William H. Boyce, Henry C. Conrad. Associate Judge-at-large, Thomas B. Heisel.

DEBOVE, MAURICE. French physician, died early in December. For some years he had been permanent secretary of the Academy of Medicine. He was born in Paris, March 11, 1845. After many years of hospital practice he was elected to the chair of pathology in the faculty of Paris in 1890; exchanged this professorship in 1901 for that of clinical medicine; and after 1902 was for a short time dean of the medical faculty. He was elected to the Academy of Medicine in 1892 and became permanent secretary in 1913. He was one of the favorite pupils of Charcot and made a specialty of neuropathy, publishing several important works on digestive pathology and intoxicants. One of the main features of his career was his activity in the campaigns against the various great modern scourges such as tuberculosis and alcoholism. As a professor he was distinguished for his lucidity, keenness, and learning, and he exerted wide influence.

DE KOVEN, REGINALD. Musical composer, died in New York City, January 16. He was born at Middletown, Conn., in 1861, and educated in Europe, graduating at Oxford, England, in 1879. He studied the elements of music in

Stuttgart and Frankfort and afterwards pursued courses in light opera composition under well-known European composers. After returning from Europe in 1882, he lived for the most part in New York, but passed two years in Washing-

ton as conductor of the Washington Symphony Orchestra. After that he became the music critic of the *New York World*. His earliest success was the celebrated light opera, *Robin Hood* (1890), whose scores became familiar throughout the entire country, and are still remembered. Other light operas are *Begum* (1887); *The Fencing Master* (1892); *Rob Roy* (1894); *The Highwayman* (1897); *The Three Dragoons* (1899); *Maid Marian* (1901); *The Student King* (1906); *The Snowman, The Wedding Trip*, etc.; and he produced a grand opera, *Canterbury Pilgrims*, at the Metropolitan Opera House, New York City, in March, 1917. His songs numbered over 300 and included some that were exceedingly popular, such as "Oh Promise Me."

DE LISLE, EDWIN J. L., M. P. British writer, died May 5. He was born June 13, 1852, studied in German universities, and became private secretary to the governor of the Straits Settlements and afterwards to the postmaster-general. He wrote *The Majesty of London*; *The Parliamentary Oath*; *The Royal Declaration Amended*; *The Evolutionary Hypothesis*, and studies on Luther and Wyclif.

DENMARK. A Scandinavian kingdom of

of Copenhagen founded in 1479 has five faculties, with 100 professors and teachers and about 2900 students. Women are admitted to the faculties on equal terms with men. There are besides various technical schools, training colleges for teachers, commercial schools, agricultural schools, etc.

PRODUCTION. The chief occupation is agriculture. By 1919 production was recovering from the effects of the war. In that year agricultural products gave a fairly good yield and in general brought high prices. Wheat and barley gave something above middle yield; rye and oats a little under middle; and root crops yielded about normal. The kohlrabi yield was particularly good as it always seems to be in cold years. The total yield of potatoes was large, principally as a result of the potato propaganda which was carried on during the war years. The hay crop was under middle as was the straw. Of field hay there was harvested only one-half of normal, while of meadow hay there was harvested three-fourths of the normal yield. The following table shows the various yields of the crops in Denmark for 1918 and 1919, and a comparison with the 1909-13 average:

Crops	Average, 1909-1913 Met. tons	1918 Met. tons	1919 Met. tons
Wheat	148,200	172,300	161,200
Rye	446,400	323,300	378,700
Barley	544,500	467,400	533,900
Oats	779,600	603,400	690,700
Mix'd oats and barley	360,900	324,900	379,000
Buckwheat	2,400	2,700	2,200
Peas	8,700	11,300	17,500
Potatoes	840,000	1,105,100	1,444,800

Crops	Average, 1909-1913 Met. tons	1918 Met. tons	1919 Met. tons
Carrots	228,800	129,600	127,400
Beets	4,444,600	5,266,700	5,114,800
Kohlrabi	4,554,600	4,559,400	4,604,100
Turnips	2,738,500	2,334,500	2,112,500
Sugar beets	788,500	944,400	1,016,600
Chicory beets	20,600	24,400	22,800
Field hay	1,090,400	343,400	591,600
Meadow hay	710,600	412,200	536,800
Straw	3,518,000	2,195,600	2,665,800

northern Europe, consisting of the peninsula of Jutland and the Danish archipelago to the east (including the islands of Zealand, Fünen, Lolland, Falster), the outlying island of Bornholm in the Baltic, and the Färoe islands in the Atlantic. By the terms of the Peace Treaty a portion of Schleswig was to decide by plebiscite whether to remain under Germany or to attach itself to Denmark. See below.

AREA AND POPULATION. The total area exclusive of Schleswig is 15,582 square miles and the total population exclusive of the Färoes and Schleswig was given in 1916 as 2,940,979. The capital, Copenhagen, had a population in 1916 of 506,390 and, with suburbs, 605,772. Only about 3.27 per cent of the total population in 1911 were foreign born.

In 1919 about 3300 people emigrated as compared with an annual emigration of between 8000 and 9000 before the war. In 1918 there were about 2500 emigrants. About 40 per cent of the 1919 emigrants were women and the chief country of destination was the United States. Canada and South America received a small number.

EDUCATION. Elementary education is free and compulsory between the ages of seven and 14. The schools are maintained by taxes on the communes. In 1918 there were 3466 public elementary schools of which 63 were in Copenhagen, 158 in other towns, and 3245 in the rural districts. The total number of pupils in 1918 was 406,000. Besides the elementary schools, there were 13 government schools and 150 private schools and certain unclassified private schools, which had in 1918 an attendance of 60,000. The University

Livestock reported in 1919 were as follows: Horses, 558,500; cattle, 2,188,100; sheep, 509,500; swine, 715,900; hens, 12,134,500. See AGRICULTURE.

The latest figures given out by the Bureau of Fisheries were for the year 1918. The total catch for that year amounted to 65,100,000 kilos, while the catch in 1917 was 63,400,000 kilos. In 1915 the catch was 66,500,000 kilos, which was the greatest that had been caught up to that time. The value of the catch for 1918 was 41,700,000 crowns (about \$11,175,600, normal rate), a considerable advance over the 1917 value, which was 35,000,000 crowns (about \$9,380,000), but the decreasing value of the Danish crown, as well as the increasing value of materials and labor, were such uncertain factors that it was impossible to form an accurate comparative idea of the catches by measuring them in money values. The prices for 1918 were relatively good. The oyster fisheries, which are considered important, are not reckoned above. In the season 1918-19 about 4,000,000 oysters were sold. Danish oysters, especially those called "Limfjords," after the Limfjord, where they are gathered, are much prized not only here but in Norway and Sweden. They are of good size, but have what is called a "beard," which is bitter to taste and is usually removed before eating. There were about 21,000 fishermen engaged in the industry in 1918, as compared with about 20,000 in 1917. The fishing fleet in 1918 numbered about 17,000 boats, of which about 5000 were supplied with motors. In 1918 was seen the best year in history of the Icelandic and Faroe Islands' fisheries, which are reckoned independent of Denmark's. These fish-

eries show in 1918 an advance of 22 per cent in quantity and 90 per cent in value compared with the 1916 fisheries. The catch on the Faroe Islands alone was valued at about 10,000,000 crowns (about \$2,680,000, normal rate) for 1918, as against half that amount for 1917. The value of the 1913 catch was not one-fourth as large as it was for 1918. The cod fisheries (the most important catch) on the Faroe Islands in 1918 reached a size hitherto unknown, amounting to 10,500,000 kilos. In 1917 the catch was 8,000,000 kilos; in 1913, 5,500,000 kilos.

There was a serious lack of sufficient fuel in Denmark and a general need of a future reliable market for coal. The source of cheap coal supply before the war was Germany, but where about 100,000 tons were formerly imported per month only about one-fourth of that quantity was being imported in the beginning of 1919, and by April the figure had fallen to about 4,000 tons. Later it averaged about 15,000 to 20,000 tons a month. The price on the German article had, however, gone much higher than the price on English coal, so that Germany is becoming a negligible quantity as a source of supply for fuel. Denmark received from England about 125,000 tons in January and 135,000 in February, which amount went to 260,000 tons in June and 280,000 in July. It then seemed that the great problem was solved, theatres and restaurants were permitted to remain open longer, and the war-long rationing of coal was partially dispensed with. August put a sudden end to prospects, as a strike occurred in England and the rise in the value of English currency made matters worse. During the rest of the year coal imports from England averaged about 100,000 tons and the former rationing had to be resorted to.

COMMERCE. The imports and exports in 1919 were as follows:

Articles	Imports	Exports
Agricultural implements. 100 kilos.	87,418	
Animals, live:		
Cattle head	442	32,301
Horses do.	4,283	1,457
Automobiles number	6,194	
Bicycles 100 kilos.	3,849	
Bicycle parts do.	9,818	
Boots and shoes do.	2,377	
Breadstuffs:		
Barley do.	343,266	10,879
Corn meal do.	31,900	58
Flour—		
Rye do.	198	80,250
Wheat do.	175,581	69,478
Maize do.	1,917,679	130
Oats do.	82,578	5,178
Rice and rice products do.	234,082	
Rye do.	100,385	52,500
Wheat do.	5,233	47,014
Cement, Portland tons	67	4,687
Cinders do.	28,756	
Chemicals 100 kilos.	159,806	
Cocon do.	63,174	
Coal tons	1,968,726	
Coke do.	259,706	
Briquettes do.	63,388	
Coffee 100 kilos.	288,173	10,241
Colors do.	39,750	
Cordage and twine do.	55,992	
Cotton do.	64,619	
Cotton manufactures do.	194,540	
Cryolite tons	3,574	
Dairy products:		
Butter 100 kilos.	3,145	366,793
Cheese do.	2,557	
Milk and cream do.	25	41,625
Earthen and Chinaware:		
Brick—		
Building thousands	20,148	
Fire 100 kilos.	75,552	
China and porcelain do.	10,180	
Crockery and sanitary equipment 100 kilos	18,727	

Pipes and tubes do.	102,406	
Tiles thousand	3,184	
Eggs 100 dozen	21	282,055
Fertilizers tons	295,975	
Fish 100 kilos.	116,388	533,461
Flint, pebbles tons		11,026
Glass, plate 100 kilos	50,138	
Glassware do.	48,153	
Hay do.		2,935
Hemp do.	33,398	
Hides and skins do.	30,318	59,659
Iron and steel manufactures, n.e.s.:		
Beams and bars, iron. 100 kilos.	813,575	
Chains and cables do.	13,163	
Hoop, iron do.	59,375	
Nails do.	17,432	
Pig iron do.	242,863	
Pipes and tubes do.	159,504	
Plates do.	644,993	
Rails, railroad do.	154,382	
Scrap iron do.		321,087
Screws, bolts, nuts do.	43,213	
Wire do.	153,287	
Kaolin tons	3,907	11,894
Leather 100 kilos.	20,860	
Linoleum do.	21,370	
Machines, sewing do.	6,374	
Malt, barley do.	169,860	21,850
Margarin do.	2,992	
Matches do.	8	
Meat and meat products:		
Bacon and pork do.		32,154
Beef, fresh do.		80,425
Casings, etc. do.	12,538	28,698
Lard do.	78,220	45,572
Mutton, etc. do.		4,142
Premier jus do.	30,933	
Stearin do.	3,884	
Tallow do.	10,191	3,314

COMMUNICATIONS. Denmark proper not including Copenhagen had at the end of 1918 4197 miles of roads besides 23,322 miles of by-ways. Railways of a total length of 2635 were open for traffic, of which 1283 miles belonged to the state. On March 31, 1919, the total value of the state railways was 359,574,936 kroner. Post offices numbered 1240 and telegraph lines had a mileage of 2273.

Denmark's merchant marine plays a most important part in bringing up the country's credit balance in the world's trade. Toward the end of 1919 the fleet was composed of the following ships over 20 register tons gross:

Kind	Number	Gross tons	Net tons
Steamships	528	570,072	386,912
Motor vessels	550	104,970	65,011
Sailing vessels	852	115,846	101,688
Total	1,930	790,888	553,606

This shows a gain of about 55,000 tons gross over the 1918 figures, but there is still a long way to go before the 250,000 tons lost during the war are replaced. This fleet has been largely dependent upon the United States and Great Britain, as these countries by treaty had disposition over more than one-half of Denmark's ships, while the remainder were bound by fast restrictions to carry imports at officially set freight rates. In April, 1919, however, the tonnage chartered abroad began to return to Danish owners, and by autumn only a few ships remained in foreign service. The arrangement with England and America was most profitable to Denmark as the unusual returns of the shipping companies show. Dividends for 1919 ranged from 25 up to and over 135 per cent, averaging 65 per cent. They ranged from 12 to 65 per cent in 1918.

FINANCE. The budget estimates of 1919-20 were: Revenue, £32,579,717; expenditures, £30,563,851. The following details of the budget for 1920-21 are taken from the *Statesman's Year Book* for 1920:

Current revenue	Kroner
Balance of domain revenues	1,579,186
Balance of state undertaking	8,407,080
Interest on outstanding debt	8,571,744
Balance of funds, etc.	681,778
Direct and indirect taxes	404,760,000
Balance of lotteries	1,461,504
Separate revenues	8,026,607
Total revenue	411,628,784
Current expenditures	Kroner
Civil list and appanages	1,222,000
Rigsdag	2,000,000
Interest and expenses on stated debt	39,855,875
Council of State	550,462
Ministry of Foreign Affairs	2,119,428
Ministry of Ecclesiastical Affairs	2,759,910
Ministry of Public Instruction	58,428,115
Ministry of Justice	30,162,685
Ministry of Interior	30,757,600
Ministry of Agriculture	8,579,121
Ministry of War	40,106,580
Ministry of Marine	25,085,000
Ministry of Finance	22,578,284
Ministry of Public Works	8,586,247
Ministry of Commerce and Navigation	3,159,611
Pensions	4,550,673
Total expenditure	270,451,576

GOVERNMENT. Executive power is vested in the King who acts through a responsible ministry and legislative power in the Rigsdag or Diet, consisting of the Folkething or lower house with 140 members and the Landsting or senate with 72 members. The King in 1920 was Christian X (born Sept. 26, 1870), and the Prime Minister and Minister of Finance was M. Neergaard.

HISTORY

MINISTERIAL CRISIS. The resignation of the government was demanded. March 27, by the King, who accused it of being "unpatriotic." M. Neergaard, the Liberal leader, was called upon to form a new ministry but became straightway the object of attack by all the progressive elements in the country and there were even threats of setting up a republic unless the dismissed cabinet was restored. M. Neergaard having failed to command a majority in Parliament, the King called upon M. Lieb to form a government without political character which should serve simply to order the new election for the lower house. This new ministry held office for only four days, retiring before the threat of a general strike. A provisional cabinet was then formed of members who opposed the King's dismissal of the Zahle ministry. The Prime Minister was M. Friis, former director of the Ministry of Justice.

ELECTIONS. The government as a result of the September elections had 82 members in the lower house, the same number as before, while the opposition had 66 members, which was eight more than at the July election. The government members comprised the Conservatives, the Left, and the Tradesmen's party. The Left polled 410,464 votes, which gave it 52 members. The other parties were represented in the lower house as follows: Socialists, 48 members; Conservatives, 27; Tradesmen's party, 3. The returns indicated a substantial majority for the government also in the Senate, where the parties stood as follows as the result of the election of September 21st: Conservatives, 68; Farmers, 28; Social Democrats, 76; Liberals 45; Left Socialists, 4. The Prime Minister on September 15th declared that Denmark in its foreign policy did not wish to exclude any nation from its relations and that it was desirable to be on the best possible terms with Germany. He also declared that Denmark would do her best toward placing the League of Nations on a strong basis and hoped that a real reduction of armaments would be effected.

THE SCHLESWIG PLEBISCITE. As recounted in the preceding YEAR BOOK in the plebiscite on the Schleswig question a large majority in the first zone decided for Denmark while in the second zone a larger vote was cast for union with Germany. At the beginning of the year the government was still undergoing attacks from the Conservatives for this result and was accused of having played into the hands of Germany. It was blamed for not having held a plebiscite in the southern zone. See POLAR RESEARCH.

DENVER UNIVERSITY. An institution of higher learning at Denver, Colo., founded in 1864. The students numbered 1774 and the members of the faculty 200. President, H. A. Bucktel, LL.D.

DE PAUW UNIVERSITY. A co-educational institution of higher learning at Greencastle, Ind., under the auspices of the Methodist Episcopal Church; founded in 1837. In the autumn of 1920 there were 942 students in the College of Liberal Arts, of whom over 500 were women, and 83 students in the School of Music. The library contained 52,293 volumes. The total capital assets were \$3,725,020 and the receipts were \$219,750. President, George Richmond Grose, D.D., LL.D.

DESCHANEL, PAUL. See FRANCE.

DES PLANCHES, Baron EDMONDO MAYOR. Italian diplomat, died at Rome, Italy, December 27. After 1901 he was Italian ambassador to the United States for nearly 10 years. He was born July 27, 1851, and went into the service of the state at an early age, becoming secretary to the minister of foreign affairs. In April, 1894, he was named counsellor to the Italian embassy in Berlin, and he afterwards held a similar position at the Italian embassy in Constantinople. After serving as ambassador to the United States, he was again sent to Constantinople, where he was ambassador for a year.

DESTROYER. See BATTLESHIPS AND OTHER WAR VESSELS.

DETROIT, MICH. See CITY PLANNING; WATER WORKS.

DETROIT, UNIVERSITY OF. An institution of higher learning at Detroit, Mich., under the auspices of the Roman Catholic Church, founded in 1877. Enrollment in 1920 was 1826 and there were 136 members in the faculty. The library contained 25,000 volumes. President, Rev. William T. Doran, S.J.

DEUEL, JOSEPH MERRITT. Magistrate of New York, died in that city, December 4. From 1904 to 1913 he was judge of Special Sessions. He was born at Deerfield, N. Y., and was educated in the public schools. After serving as secretary to Roscoe Conkling, he held several positions in the Federal courts and was police justice in 1894 and city magistrate from 1895 to 1903. During his term as Special Sessions Justice occurred the celebrated *Town Topics* case which was followed by charges on the part of the prosecuting attorney, Mr. Travis Jerome, that Justice Deuel in the course of the trial had been guilty of misconduct which disqualified him for judicial office. The prosecution was unsuccessful, and later Judge Deuel sued the Mayor for costs.

DE WEND-FENTON, WEST FENTON. British journalist, died, April 6. He was born at Oldbury, Oct. 23, 1881, and graduated with honors at Oxford, where he distinguished himself in athletics. He was for many years prominent in sports, particularly in racing, and rode in many races himself. He became the editor and managing director of the *Sporting Times*, and subsequently the proprietor and editor of the *World*. He wrote a volume entitled the *Primrose Path*.

DEXTER, FRANKLIN BOWDITCH. Librarian and historian, died at New Haven, Conn., August 13. He was born at Fairhaven, Mass., Sept. 17, 1842, graduated at Yale in 1861, and was assistant librarian from 1869 to 1912, serving meanwhile as registrar-secretary of the corporation and learned professor of American history. He wrote various volumes pertaining to the biography and annals of the college; a documentary history of Yale University (1916); edited two volumes of New Haven town records 1649-84 (1917-18).

DIAMONDS. Diamonds after the war experienced a pronounced boom, which naturally led to active mining and search in new as well as established fields. Along with the general progress toward deflation this great demand and the high prices characteristic of 1919 lasted but a few months into 1920. In South Africa the slump came in March, though the industry was active during the entire year. As a result of the record prices which prevailed in 1919 the De Beers Consolidated Mines, Ltd., paid their great-est dividend. Naturally the United States was

a leading customer and in 1919 its imports of precious stones and pearls, of which diamonds formed a substantial part, amounted to the notable record figure of \$105,273,543. In 1920 the demand continued for the first half of the year, and for nine months the imports of precious stones and pearls amounted in value to \$63,185,739, or a larger total than for any corresponding period except that of 1919. The decrease of 1920 was noted especially in diamonds and pearls. The new diamond areas opened up in South Africa included a field in the Postmasburg region about 140 miles west of Kimberley where pipes recently discovered were being worked, and at Thlaping farm on Taung's Reserve, Bechuanaland, though in the latter case the output up to the end of June, 1920, 7207 carats, proved below expectations. The Consolidated Diamond Mines of Southwest Africa, an English enterprise, in which some Americans were interested, had taken over the fields formerly operated by German interests. From the Belgian Congo in 1920 an output of about 215,000 carats of diamonds were reported from the Kasai fields by the Formentière Company which increased its reserves of diamondiferous gravel. Here development rather than increased production was the order, and the bounding and examination of its 4000 miles of diamond bearing land were being undertaken. In addition development work in the Belgian Congo was being undertaken by five associations whose production, though slight in 1920, it was believed would become important in 1921. An allied company operating in Angola, Portuguese West Africa, in 1920, recorded a production of approximately 100,000 carats. The YEAR BOOK from time to time has recorded progress in the possible development of diamond fields in the United States. In 1920 work was done in Pike County, Ark., and the preliminary efforts brought to light about 3000 stones, weighing on an average four-tenths of a carat. In South America British Guiana in 1920 produced diamonds amounting to 18,159 carats.

DIESEL ENGINE. See INTERNAL COMBUSTION ENGINE.

DIETETICS AND DISEASE. The older scientific plans of feeding, together with the numberless popular fads in eating, are but the precursors of a system of dietetic treatment of disease of almost unlimited possibilities. Recently the statement has been made by conservative men that faulty eating can give rise to almost any one of the morbid conditions and that in consequence almost any diseased state can be benefited by diet. But we must no longer understand diet in its old restricted sense. It was once taught that the essentials of diet comprised only a certain amount of nitrogenous food for growth and repair and a much larger fraction of combustible food for heat and energy, with the addition of a little mineral matter which, however, occurs in sufficient amount in the other foods. Eventually it was discovered that certain animal glands contained powerful principles which supplied certain substances to the body in which the latter was deficient as the result of heredity, privation, or disease. These "internal secretions" were at first used only in well marked conditions of underdevelopment—retarded physical and mental growth—but gradually it became recognized that almost any one out of health might be suffering temporarily from deficiency of one of the numerous secretions, and a new system of therapeutics

known as endocrinology has developed. Although for convenience's sake these substances are given as if they were drugs, in so many grains so many times a day, they were originally given as food and since they supply substances in which there is a deficiency in the organism, they remain foods or at least a combination of food and drug—and it is becoming increasingly difficult to draw a line between the two classes. These substances are also given by hypodermic injection and in certain cases animal or human glands are transplanted with the best effects. The whole of the subject of "rejuvenation" which is now being commercially exploited is comprised in the transplantation of certain glands or the hypodermic injection of their extracts.

We have known something about internal secretions for more than a generation but there is another type of reinforcing the organism by feeding which is much more recent, although its beginnings go back many years—in fact ever since it was learned that scurvy can be prevented by fruit juices and other dietetic articles. In fact it was several centuries ago that the introduction of the potato from America to Europe was credited with the stamping out of land scurvy, in the latter continent. To-day we say that fruit and vegetables cure scurvy because as a result of scanty or unbalanced regimen the body has been deprived of certain substances called "vitamines" which are present in the said articles in abundance. But it is probably a mistake to apply the term in question to antiscorbutic food. This term "vitamine" came into use comparatively recently in connection with a special exotic disease caused by eating peeled rice, the cortex of the rice grains containing a substance necessary for health in those who live almost wholly on rice. These two examples suggest the existence of others and in fact of a whole group of deficiency diseases which differs radically from those due to absence of internal secretions. Just now for want of a better term we may speak of these substances as vitamins. When there is an abundance and variety of food we need have no fear of deprivation of vitamins, as these occur in a great variety of ordinary foods. As far as known but one entirely new food article has come into use on the strength of richness in vitamins, and this is yeast in the form of the compressed cakes which are for sale everywhere. But on a restricted or unbalanced diet it is possible that cooking and the use of decorticated cereal grains, rejection of certain portions of food as the skins of potatoes, preservation of all kinds, ordinary sterilization and other tampering with crude food supplies may cut off something necessary for growth and development and maintenance of health. This can be easily studied in artificially fed babies.

But vitamins by no means exhaust the list of food principles. We have long known that "animal" food (comprising also vegetable protein) is split up into end products known as amino-acids, before final utilization in the body. The number of these substances is very large and originally it was thought to matter little which were present or absent in a given digestion process. Different kinds of protein are comprised of different amino-acids and as numerous proteins occur side by side in the daily diet the variety as well as the number of the end products seems infinite in possibilities. Prolonged study of the individual

amino-acids from all angles has shown that they have not only special dietetic activities but also possess in certain cases a definite physiological action. They thus bear a strong resemblance to internal secretions although formed in the digestive tract. Moreover these end products often decompose in the intestine as a result of bacterial activity and some of the amines, as these putrefactive products are called, are physiologically active if not actually poisonous. We are therefore confronted with a very difficult dietetic problem of two fold character, first to insure to the subject the kind of amino-acid needed for growth and nutrition and the maintenance of equilibrium (health), and second to keep out the end products which are unnecessary and therefore perhaps dangerous. Recently Zuntz of Berlin has prepared from some substance rich in keratin as hair, wool, horn, etc., aminoacids which when fed to sheep greatly increase the yield of wool; and such discoveries are of great promise for the future. There are still other cognate problems of diet of great interest but they cannot be considered in the available space.

DIGGLE, JOHN WILLIAM. Bishop of Carlisle after 1904, died March 24. He was born at Pendleton, England, March 2, 1847, educated at Oxford, where he graduated with honors. After his ordination in 1871 he was curate of Whalley Range and of parishes in Liverpool and Walton, and from 1875 to 1897 was vicar of Mossley Hill. In 1891 he was president of the Liverpool Council of Education and in 1899 preacher at the University of Oxford. Between 1902 and 1904 he was rector at Birmingham. His publications include *Godliness and Manliness; True Religion; Rainbows; Religious Doubt; The Ministry of the Word and Sacraments; The Foundation of Duty*, etc.

DIPHThERIA. Several years ago, the high point of the preventive action of diphtheria antitoxin seemed to have been attained and while mortality has been reduced 80 per cent, incidence or morbidity has been cut down only 25 per cent. This was due to the briefness of the immunity, which lasted only from two to four weeks. At this juncture the Schick test was introduced, for it revealed in advance the subjects who are susceptible to the disease. These could then be treated by the new vaccines until the susceptibility had been removed. Of the so-called non-immunes about 92 per cent were found to be immune a year after the vaccine treatment. The latter differed from the original serum in being composed both of toxin and antitoxin, combining serum and vaccine prevention. Such immunity was moreover of indefinite length and it is hoped that it is practically permanent. In only a few per cent does the Schick test again become positive, showing loss of the immunity. In the report of the committee appointed by the New York City Health Office on the Schick test there was a material of over 300 children who had originally given a negative Schick test and who were therefore naturally immune. These were followed up over several years and in but five did the reaction become positive, showing that this natural immunity may in rare cases be forfeited. The vaccination treatment, unlike the results commonly encountered under the circumstances, was well borne by very young children. This is an argument for the early application of the preventive vaccination. Children of school age,

many of whom are naturally susceptible to diphtheria because of lack of opportunity for treatment during their infancy, may in time come to be vaccinated by the school physicians by wholesale. This movement is already under way in some of the schools, of course with permission of the parents after the latter have received a course of instruction in the shape of leaflets, lectures, etc.

DIRIGIBLES. See AERONAUTICS.

DISASTERS. See EARTHQUAKES; FIRE PROTECTION; RAILWAY ACCIDENTS; SAFETY AT SEA; etc.

DISASTERS, MARINE. See SAFETY AT SEA.

DISCIPLES OF CHRIST. This communion is the fifth largest Protestant body in the United States. It dates its beginning from 1809, and its growth to present proportions has been very gratifying to its constituency. Exact figures for 1920 are not yet available, but data being gathered show figures approximating 1,400,000 members, 12,000 churches, and 9000 ministers. An annual convention called The International Convention of Disciples of Christ has advisory relations to administer work for missions, education, and benevolence. Recently six boards united under one called the United Christian Missionary Society with headquarters in St. Louis, Mo. This one board administers all the missionary and benevolent work at home and abroad. Its Board of Directors consists of 24 members divided equally between men and women. There is also an Educational Board which has advisory relations to 26 colleges, and a Board of Administrative and Social Service, and a Commission for Christian Unity. Practically every State in the United States and every province in Canada has a local organization which administers the work locally. There are many papers published by the Disciples of Christ, chief of which are *World Call*, *The Christian Evangelist*, *The Christian Century*, and *The Christian Standard*. The president of the United Society is F. W. Brunham, St. Louis, Mo. The secretary of the Educational Board is H. O. Pritchard, and the officers of the International Convention are Rev. Geo. A. Miller of Washington, D. C., president; and Rev. Robert G. Frank, Dallas, Texas, secretary.

DISEASES OF LIVE STOCK. See VETERINARY MEDICINE.

DISEASES OF PLANTS. See BOTANY.

DIXON, Sir ALFRED HERBERT. British cotton expert, died in London, England, December 10. He was chairman of the Cotton Control Board and president of the International Cotton Federation. In 1919 he headed the British delegation which attended the World's Cotton Conference at New Orleans (October), and he was a representative at the conference of Zürich, Switzerland, in June.

DOBRUJA. The name of the southeastern portion of Roumania. Area, about 8970 square miles; population (1912), 381,306, including Bulgarians, Roumanians, Turks, Tartars, Russians, Germans, and other races. Chief towns, Constantza (27,622), and Tulcha (22,186).

DOCKRELL, BENJAMIN MORGAN. British physician, died, March 15. He was born Feb. 2, 1865, and educated at the University of Dublin and at the Royal College of Surgeons. After 1888 he specialized in skin diseases and did important work as an officer in various medical in-

stitutions, serving for 25 years as physician to St. John's Hospital and being president of the London Dermatological Society after 1912. His publications include, *Hydronaphtol as a Specific in the Treatment of Ringworm* (1889); *The Skin and How to Keep it Healthy* (1893); *Lichen from a Histological Point of View* (1901); *Atlas of Dermatology* (1904), and various treatises and papers on specific skin diseases.

DOCKS AND HARBORS. The great marine terminal development carried on by the United States government in connection with the war, and the realization that with increased merchant shipping and commerce suitable provision must be made for its accommodation was incentive for many American cities to consider undertaking the increase of their port facilities as indicated in part below. There was some criticism of the slowness of the national government in releasing for commercial use many of the war terminals which were well suited for the purpose.

AMERICAN ASSOCIATION OF PORT AUTHORITIES. This organization held its annual convention at Chicago, September 30th to October 2d, at which were brought out interesting papers and discussion relative to harbor works and administration. The close relations of engineering to port development along the varied lines of general and economic planning design of structures, and handling of materials figured prominently in the proceedings. Local facilities, conditions, rates, and commerce at several individual seaports were discussed in one group of papers, while another group dealt with inland navigation and lake ports. Such topics as belt railways at ports, State as against city ownership, warehouse facilities, wide piers, and various construction methods, also were treated in papers, a particularly valuable one being presented by Captain F. T. Chambers, Chief Engineer, United States navy, former chief engineer of the Port Facilities Commission on the Shipping Board and in 1920 working with the Chief of Engineers, United States army, on port work. Captain Chambers' various reports in this field had proved remarkably informative and are well worth examination by all interested.

The Manchester ship canal, the New York State barge canal, the Illinois River waterway and some lake port developments were also subjects of papers. The latter included the Toronto harbor works, a rail and water terminal project for Detroit, and the Calumet harbor project at Chicago to eliminate the Chicago River as a hindrance to both land and water transportation.

Amendments to the constitution were adopted which provided, among other matters, for a larger representation of engineers. Officers for 1921 included Benjamin Thompson, of Tampa, Fla., president; and M. P. Fennell, Jr., Montreal, Can., secretary. The 1921 meeting was to be held at Seattle, Wash.

NEW YORK PORT DEVELOPMENT. In the spring of 1920 the largest steamship pier project ever contemplated for the city of New York was started, and contracts were let for the construction on Staten Island of 12 piers ranging in length from 1000 to 1160 feet and in width from 125 to 209 feet, all with uniform 300 foot slips. This action was important as transferring to Staten Island activities that previously had centred on the Manhattan and Brooklyn waterfronts, but the possible drawbacks did not appear to influence

the shipping interests for leases for the piers were signed before the contracts for their construction were let. The financial arrangement provided that in the course of 30 years all costs of the development by the city would be amortized. The 12 piers numbered from 6 to 18 were leased as indicated below, each pier being designed to meet in large measure the needs and wishes of the lessee.

DATA ON STATEN ISLAND PIER DEVELOPMENT
FOR NEW YORK CITY

No.	Average length, Width,		Shed	Lessee
	feet	feet		
6	1,124	125	1-story	Green Star S.S. Co.
7	1,084	125	1-story	Open
8	1,044	125	1-story	Wesol-Duval Co.
9	1,026	125	1-story	Moore & McCormack
10	1,137	125	1-story	Rapores S.S. Line
11	1,100	125	1-story	Intern'l Mercantile Marine
12	1,030	209	2-story	Pan American Terminal &
13	1,030	209	2-story	Dock Corporation
15	1,047	130	2-story	Union Transport Co.
16	1,110	130	2-story	
17	1,078	125	1-story	Nippon Yusen Kaisha
18	1,106	125	1-story	Compagnie Generale Transatlantique

The piers 125 feet wide are completely covered, except for string-piece space, with a one-story shed. The two 130 feet wide are completely covered with a two-story shed, the two 209 feet wide with a middle two-story shed of 131 foot width and a marginal railway space of 28 feet on each side. On these latter two full mechanical equipment was to be installed for handling freight direct from the cars into the ships and vice versa.

The piers as designed embraced no novel features, following the standard New York Dock Department practice with reinforced concrete deck finished with 2-inch asphalt block for wearing surface. On all of the piers double track railroad could be installed inside the sheds, the 209 foot piers being designed with two tracks on each side of the shed, the floor of the shed being on the same level as the car floor. The pier decks were designed for a live load of 500 pounds per square foot and the second floors for 400 pounds for the 209 foot sheds and 350 pounds for the 130 foot. The plans called for full equipment according to New York practice.

The designs of these piers were criticized vigorously during the year on the score that they were too narrow, that they failed to provide railroad track facilities on the piers outside of the sheds except for the wider piers, and the general lack of modern and adequate cargo handling and mechanical equipment. On the other hand the designs were vigorously defended by the New York City Dock Department, which claimed that they were especially applicable to local conditions and the important consideration governing the port and its shipping. Description of the piers and discussion of their merits and demerits may be found in *Engineering News-Record*, Vol. 84, No. 22, p. 1047, and Vol. 85, No. 4, p. 160.

Much of New York's water front was marked by inadequate or obsolete piers and accordingly the replacement of a number of old North or Hudson River piers by new ones was determined by the city administration. The Sinking Fund Commission authorized the expenditures of funds to supplant 32 antiquated piers between Vesey and Perry streets on the lower part of Manhattan Island with 18 new piers. Most of the old ones were of 30 years' standing and were narrow with

narrow slips. It was decided that two of the new piers should be 100 feet wide, seven 150 feet wide, and nine 125 feet wide. They were to be from 900 to 1025 feet in length.

Later in the year the Department of Docks and Ferries of New York announced that it contemplated the construction of three piers each 700 to 1000 feet long and 250 feet wide at Owls Head Bay, on the Brooklyn shore just inside the Narrows.

Still other steps in the development of New York port facilities only this time on the New Jersey shore was the announcement made by the Cunard Steamship Co., Ltd., that it proposed to undertake the construction at Weehawken, N. J., on the Hudson River about opposite 36th Street, New York City, of a group of eight piers of 1000 foot length and one shorter pier. The pier and slip widths and exact details of handling equipment or of layout were not given out definitely, but pier widths of 150 feet with full width sheds and a multi-story marginal warehouse were understood to be elements of the scheme. The new group of piers, it was announced, were to be used only for freight ships the passenger terminals remaining at the Chelsea piers of New York City.

PORT DEVELOPMENT AT BALTIMORE. The Port Development Commission of Baltimore, Nov. 8, 1920, adopted nine general requirements as a statement of policy in undertaking the harbor development work for which \$10,000,000 was available and which was required by the commercial and shipping growth of the city. As these requirements represent the modern tendency of enlightened engineering and shipping progress they may be quoted in full as follows:

It shall be the policy of this commission

(1) To develop the port of Baltimore in accordance with a definite and comprehensive working plan, based on the best modern conception of port design. This plan shall serve as a guide for each step in the development in order that the completed whole may be harmonious in the correlation of its individual parts.

(2) To consider the elemental function of a pier the furnishing of a safe means for the expeditious and economical interchange of freight between land and water carriers and not merely the furnishing of a shelter for a ship so as to insure stability during the process of loading and unloading.

(3) To make improvements for the broad purpose of the widest possible use and benefit of the port as a whole and not solely for the narrow purpose and restricted use by meeting only present conditions or the special requirements of prospective lessees. All structures shall be readily adaptable to future changes in kinds of cargoes, methods of operation and special requirements of future lessees.

(4) To obtain expeditious movement of cargoes between land and water carriers and a maximum of economy by constructing piers large enough to hold the full contents of vessels which can tie up to them, and by making proper provision for the installation of mechanical appliances and facilities to move these contents to or from the piers with the least possible delay to vessels.

(5) To locate all improvements preferably in places where it is possible either now or at some future date to make railroad connections with all the trunk lines entering the city, and to locate warehouses, wherever practicable, so that there

will be the shortest possible movement of cargoes from the carriers to the place of storage.

(6) To provide the space and supports for ample railroad tracks on both the inside and outside of piers so that these tracks may be added at any time required.

(7) To construct transfer sheds with at least two stories wherever the business of the lessee warrants such construction, and when only one story is required at time of construction, to design the foundations and the framework in such a manner that an additional story can be added at any future date with the least possible interference with the operations on the first story.

(8) To build all structures with the primary conditions of stability, permanency, and economy.

(9) To have in view

(a) The ultimate concentration of terminals and shipping facilities so that the combined railroad trackage may be made accessible to all piers, and

(b) The unification of the administration of the terminals and shipping facilities so as to assure coördination and coöperation of all interests.

As soon as the Port Development Commission could find lessees for the proposed piers \$10,000,000 would become immediately available for their construction and \$10,000,000 addition would become available later, in accordance with a vote for a bond issue aggregating \$53,000,000. It was expected that work would start early in 1921.

NEW ORLEANS INNER HARBOR. During the year work was continued actively on the construction of the New Orleans Inner Harbor begun in 1918. The principal part of this project was the navigation canal, connecting the Mississippi River with Lake Pontchartrain. The work here in 1920 was considerably more than half completed, and attention was being specially directed to the construction of the lock and cutting the approach from the river.

The canal connecting river and lake is approximately 28,000 feet long, and was planned eventually to have a depth of 30 feet, a bottom width of 150 feet, and a water level width of 330 feet. The lock which provides for the difference in level of the lake and the river, was designed with a usable length of 640 feet, a width of 75 feet, and a depth over sills of 30 feet. Four lift bridges cross the canal, one of which is supported on the lock substructure, while a large concrete siphon carries one of the city's main drainage outlets. The estimated total cost of the project was \$19,500,000. The general plan of the canal was discussed in the *YEAR BOOK* for 1918, p. 113.

MILWAUKEE HARBOR DEVELOPMENT. In the general movement for the improvement and development of harbor facilities among the cities on the Great Lakes, Milwaukee, Wis., was conspicuous in 1920. The Harbor Commission with competent engineering advice adopted comprehensive plans for a complete revision of the port facilities to be executed at the rate of about \$500,000 per year. As provided by law, these plans were to be submitted to the Common Council for approval. It was proposed here to develop an outer harbor, which has not hitherto existed at Milwaukee, and add terminal facilities on the outer shore of the inner harbor at Kinnickinnic Bay. This would require the reclamation of land on Jones Island, much filling

behind a new bulkhead north of the harbor entrance, and construction of additional breakwater to protect the outer harbor.

The radical character of these proposals may be realized when it is stated that there were no wharves or terminals on the Milwaukee lake front, but that the shipping of the port was handled along the rivers emptying into the lake there. Entrance to these rivers was protected by parallel jetties and by a lake breakwater northward of the entrance.

The new development contemplates the extensive building of quays, car ferry slips, coal pock-ets, grain elevators, piers, and storage areas completely connected by terminal railways. The piers were all to be fitted with modern mechanical freight handling equipment. The work in progress in 1920 consisted in completing a rubble mound at the harbor entrance behind which filling could be done, and a revetment along the inner side of Jones Island.

SEATTLE PIER CONSTRUCTION. During the year there was built at Seattle, Wash., a new pier 365 wide and 2560 feet long at an estimated cost of \$2,500,000, as an extension of the Smith's Cove improvement of the Port of Seattle Commission. At this point there had been operated by the city for five years Pier A, 310 feet wide and 2543 feet long, over which in 1918 808,000 tons of freight had been handled with a net profit of \$378,000 to the Port Commission. In 1919 the freight taken care of at this pier totalled 1,100,000 tons. Although six large deep sea vessels could be laid alongside of Pier A, it was found that additional port facilities were required, and accordingly the construction of Pier B, adjoining and across a slip 350 feet wide whose dimensions are given above was decided upon, the plans being prepared after a careful analysis of experience and local conditions and a study of pier construction elsewhere. The main design of the new Pier B involved a central portion of 215 feet filled in solid, the material being pumped by suction dredges from the slips alongside the pier. This fill contained about 1,000,000 cubic yards. (Another 1,000,000 cubic yards was used to fill a waterfront street connecting the Smith's Cove Terminal with Seattle's business district.) A 75-foot wharf was built on either side of this central fill whereby it is possible to maintain a 35-foot depth of water at low tide without the use of a retaining wall. The tidal variation of the harbor at Seattle is 17 feet so that there is a total of 52 feet of water at high tide alongside the pier. The slope from the top of the fill to the channel bottom is covered by a 2 to 3 foot thickness of rock to protect it from wave action. The wharf was constructed entirely of creosoted piles and timbers, a total of 12,000 piles being used.

In the design of the new pier particular attention was paid to the arrangement of railway track so that freight cars could be readily switched in proximity to any ship alongside. There was also a complete mechanical handling equipment and storage or transit sheds, portions of the latter located near shore being arranged for passenger accommodation on their second floor to which access had by an overhead bridge and viaduct, obviated street and track crossings.

SECTIONAL FLOATING DOCK. During the year there was completed for service at Pensacola, Fla., a sectional floating dry dock made continu-

ous by interlocking. The dock was built of timber and was designed for a normal lifting capacity of 5000 tons. It was capable of handling a maximum load up to 6000 tons, for each of the five sections had a reserve buoyancy of 1200 tons. The dock had a length over all of 380 feet, an extreme width of 94 feet, with a width of 78 feet 2 inches between the wings at top and 74 feet 2 inches at deck level. The pontoons were 12 feet deep, and could be submerged to give 18 feet of water over the top of the 42 inch keel blocks.

The advantage of a sectional dock is that any one section can be docked in the remaining sections for painting and repairs, and in the present structure by a system of interlocking connections the longitudinal trusses of the wing walls of each of the five sections are made continuous for the length of the entire dock, the various sections being united into a rigid unit. The flotation of the dock is obtained by means of 20 vertical 10-inch centrifugal single suction pumps of the impeller type, driven by electric motors, there being one pump in each of the four transverse compartments in each section. The pump and motor equipment is sufficient to raise the dock with its load of 5000 tons in 45 minutes. Current is supplied from the shore and there is a single switch house on the pier in proximity to the dock-master's station.

TORONTO HARBOR IMPROVEMENT. In 1912 an elaborate scheme for the development of the harbor at Toronto, Ontario, was determined on to cost about \$20,000,000. While the work was begun and was prosecuted more or less in spite of the war nevertheless the latter work was principally in the direction of reclaiming ground for munitions factories. The original development as proposed in 1912 was divided into three parts. To the west of an island which protects the center part of the city from Lake Ontario the shore front was to be protected by a paralleling breakwater and developed for park, amusement and residence purposes.

The water front facing the bay was to be developed by the construction of wide piers on which industrial plants were to be built. Portions of the island were to be filled in with material dredged from the bay which was to have a depth of 38 feet. Between the island and the city, the former marshy area known as Ashbridge's Bay was to be filled in and developed for industrial purposes. Here a ship channel 400 feet wide would afford access to a 1100 foot square turning basin in the center of the district. Boulevards were planned around the island from one part of the city to the other, and the west end of the island separated from the lake by small lagoons would give pleasing sites for summer residences. Progress was made in 1920 in many portions of the general work which also involved a future location of the railways both with regard to the new union station and the development of well defined transportation centres. The principal objects of work were the completion of the west breakwater, extending the central pier district, completing the turning basin, and developing certain park and recreation facilities.

MARSEILLES HARBOR IMPROVEMENT. The development of the Port of Marseilles and the construction of the Rove Ship Tunnel, projects planned before the war but interrupted in their execution until the close of hostilities represented some of the most important engineering work

in progress in France in 1920. The City of Marseilles which is the chief port of France is located at the head of an excellent harbor near the mouth of the Rhone River, and at the terminus of the great Paris-Lyons-Marseilles Railway, serving all interior France as the principal port for the large Mediterranean trade. In addition, Marseilles has to a large extent served as a port for Switzerland also whose trade later was directed to Genoa in large measure. As a result of this commerce since 1910 the equipment of the port had been wholly inadequate to serve the increase of shipping, and while from 1900 to 1913 the area of the quays and docks was increased some 19 per cent the total traffic of the port increased 90 per cent. The imports of Marseilles, which suffered of course during the war, in 1916 were 5,704,903 tons and its exports 1,493,535 tons. The chief traffic is naturally import traffic with the Mediterranean ports, comprising 36 per cent of the total, of which 64 per cent is with Africa. Import traffic with the United States, England, and India comprised 11, 20, and 11 per cent respectively of the total.

The port and harbor includes a number of main features most of which were undergoing improvement in 1920, several important works being practically completed. These features were summarized in an interesting paper by Professor Thorndike Saville in *Engineering News-Record* for Nov. 25, 1920. They are referred to below:

1. The Grand Jetty. This is a concrete sea wall and dike forming an outer barrier, which runs parallel with the shore and serves to protect the docking basins, of which it forms one side. The sea wall itself acts in part as a dock, and is extended by a dike of masonry blocks to form a fore-port to the basins. As the latter are developed the jetty must be increased in length and its terminal quay was nearing completion in 1920.

2. The Interior Basins. These are large areas protected by the Grand Jetty, and flanked by quays with freight handling machinery. They are large enough to accommodate and allow to maneuver the largest transatlantic liners entering the Mediterranean. One of the basins, named the President Wilson Basin, was virtually completed in 1920, increasing the water area of the port by some 100 acres and the quay length by about 3600 linear feet, or an increase in the port capacity of 15 per cent. Further basins to be completed in 1924 or 1925 were projected.

3. A coast-wise canal from the interior basins and port to the Rove Tunnel with a minimum depth of 3 meters (9 feet 10 inches). This allows standard 600 ton river barges to come alongside the quays and proceed directly to the Rhone River.

4. The Rove Tunnel. This project which was described in the *YEAR BOOK* for 1915 and 1916 is one of the largest single span tunnels in the world, being designed to permit river barges to proceed direct from Marseilles to the Rhone, and thence to the interior of France. Work was in progress in 1920 and the completion of the tunnel in 1924 was looked for.

5. The Development of the Etang de Berre. A great inland sea, adjacent to Marseilles, but separated from it by the Rove Hills. It was to be connected with Marseilles by the Rove Tunnel, and with the sea by the Straits of Martigues where a channel 270 feet wide and 46 feet deep

would be dredged. It was planned to develop here a supplementary port for Marseilles, a barge terminus for river traffic, and a protected naval base.

6. Canal from Marseilles to the Rhone. This canal commenced by Napoleon I, passes along the coast to the Rove Tunnel, through the Etang de Berre and thence to the Rhone at Arles. It forms a direct water highway from Marseilles to Lyons and interior points, and is destined eventually to make possible water communication from Marseilles to Switzerland through Lake Geneva, consequently its deepening to a maximum of 8 feet and the construction of new locks at Arles was in progress.

SYDNEY, NEW SOUTH WALES. There were under construction in 1920 increased railway and harbor facilities for Sydney, New South Wales, at Darbor, west of the city and at the head of the landlocked bay on which the city is situated. In addition to reclaiming by filling 23 acres at the inner end of Darling Harbor, there were in course of building double-deck steel and concrete freight sheds on long piers for ocean steamship service, to be served by a marginal railway connecting the city terminals with the freight belt line. An important terminal facility also under construction was a grain elevator with a storage capacity of 6,500,000 bushels located at Glebe Island. The railway facilities were being properly coordinated with the port development and in order to keep switching movements clear of the harbor work a freight yard with capacity for 3000 cars was built at Rozelle, the junction of the lines to the docks and to the grain elevator.

DODECANESIA or the **DODECANESE**. (Greek for Twelve Islands). A group of islands lying off the southwest coast of Asia Minor. See GREECE.

DODGE, HORACE E. Millionaire automobile manufacturer died at Palm Beach, Fla., December 10. After the death of John F. Dodge, in January, he was the sole head of the Dodge Brothers' Automobile Co. He was born in Niles, Mich., and acquired the knowledge of machinery in the shop of his father, an iron-worker. He worked as a journeyman machinist in several cities of Michigan, and later with his brother, entered the establishment of Henry Ford. The Dodge Brothers made a great success with the so-called Dodge car.

DODGE, JOHN F. Millionaire automobile manufacturer died in January. At the time of his death he was head of the firm of Dodge Brothers. He was born in 1866 and worked with his brother as a journeyman machinist until they went into the Henry Ford establishment. The Dodge car won a great success some few years ago. The Dodge Brothers had some 18,000 men working under them.

DOMINICA. See LEEWARD ISLANDS.

DOMINICAN REPUBLIC, or **SANTO DOMINGO.** A West Indian state occupying the eastern and larger portion of the island of Haiti; capital, Santo Domingo.

AREA AND POPULATION. The area is estimated at 19,332 square miles and the population was estimated in 1918 at 955,159; other estimates are much lower, placing the population on the aver-

age at about 600,000. The inhabitants are of mixed race, chiefly of European, African, and Indian blood, but also comprising some Creoles of Spanish descent. There are many Turks and Syrians, for the most part in the city of Santo Domingo. The language of the people is Spanish, but there are a few descendants of American negro emigrants who speak an English patois, and along the frontier the Haitian French patois is spoken. Santo Domingo in 1919 had a population of 26,812 and Santiago de los Caballeros a population in 1917 estimated at 14,744. Other estimates place the population of these two cities much higher and the exact number is uncertain. Another large town is San Pedro de Macoris, with a population variously estimated at from 10,000 to 20,000.

EDUCATION. In 1919 the number of pupils in all the schools was estimated at 82,000 as compared with 51,585 in 1918, and there were 868 public schools of which six were secondary and with a teaching staff of 1468. Various measures have recently been taken under the military government to reform the methods of education, including the introduction of manual training or agricultural teaching in the public schools.

PRODUCTION. The country is primarily agricultural and manufacturing is carried on only on a small scale. The leading crops are sugar, cacao, and tobacco. The chief industry is the making of cane sugar. In 1918-19, the production amounted to 1,715,197 bags of 320 pounds each, valued at \$19,020,467. The selling prices in 1918 reached the highest point on record, averaging a little less than five cents a pound. The great bulk of the crop went to American ports for transshipment to Canada, England, and France. The chief port for the export of sugar is San Pedro de Macoris. As to cacao the average crop yields about 50,000,000 pounds. In 1918 it amounted only to 39,582,900 pounds, being one of the smallest harvested in recent years. Besides sugar and cacao there is a considerable production of tobacco leaf and these three products along with coffee and honey constitute the main articles of export. The leading imports are cotton, rice, foodstuffs, machinery, and fibres. The sugar crop of 1918-19 was 171,519,737 kilos, worth 19,020,467 pesos (peso equals \$1), coming in from various parts of the country, as follows: San Pedro de Macoris, 107,374,982 kilos; Santo Domingo, 35,723,655 kilos; Seybo, 20,459,936 kilos; Azua, 6,411,894 kilos; and Puerto Plata, 1,549,270 kilos. The tobacco crop for 1920 was estimated at 60,000,000 pounds.

COMMERCE. The imports of merchandise in 1919 were valued at \$22,019,127 and the exports at \$39,601,892, a considerable gain over the preceding year especially in the exports owing to the scarcity and consequent high price of sugar in the United States. In 1919 the United States supplied 82 per cent of the imports and received over 61 per cent of the exports. In respect to the imports, the United Kingdom held the second place and France the third. The chief imports in 1919 were iron and steel manufactures, cotton and cotton manufactures, rice, and wheat flour, and the chief exports were raw sugar, cocoa, and tobacco. The following tables show the value of imports and exports by countries for the calendar year 1918-1918-1919.

Countries	1918	1918	1919
IMPORTS			
United States . . .	\$5,769,061	\$17,037,041	\$18,113,304
Cuba	7,852	121,773	152,174
United Kingdom . .	730,191	529,351	346,217
France	274,318	99,084	171,900
Germany	1,677,833	2
Italy	173,105	34,716	77,580
Spain	210,781	48,795	125,931
Other countries . .	429,737	1,865,392	3,032,019
Total	\$9,272,278	\$19,736,152	\$22,019,127
EXPORTS			
United States . . .	5,600,768	18,170,291	24,040,059
United Kingdom . .	241,810	412,781	223,352
Cuba	27,536	132,074	162,549

Germany	2,068,884
Italy	20,430	5,153	4,685
Spain	793,400	634,972
Canada	1,594,118	595,560	6,421,231
Other countries . .	528,994	1,581,205	4,123,410
Total	\$10,469,947	\$22,372,344	\$39,601,892

HISTORY. In October a report by the commander of the United States Medical Corps indicated great improvement in financial, educational, and sanitary affairs. It was said that since the American military government was established in November, 1916, the misrule, corruption, and disorder that had prevailed hitherto and the rapid increase in the foreign debt had been largely checked. There was a surplus in the treasury of \$3,200,000 and the interest on the bonded debt of \$20,000,000 had been regularly paid and it was expected that the whole debt would be liquidated in 1925. A fair and efficient system of taxation had been established. As to schools, the attendance in 1916 had been only 18,000 and was given in 1920 at 120,000, while the number of school houses in the country districts was reported to have increased from 30 to 647. Other improvements claimed by the administration were the sanitation of every district, the establishment of charity hospitals and of a leper colony, and the organization of vital statistics. On December 24 the President ordered the relaxation of military rule as a step toward the return of the Dominican Republic to complete independence and directed at the same time Admiral Snowden to issue a proclamation to the following effect: "Inasmuch as it had been the intention of the United States to withdraw its aid as soon as the purposes of its intervention had been attained and as these purposes had now been accomplished, the Government of the United States took prompt steps to withdraw. A commission of Dominican citizens would be appointed to propose amendments to the constitution and a revision of the law, which upon approval by the American military government in occupation would be submitted successively to a constitutional convention and to the congress of the Dominican Republic." It went on to say that for some time past there had been complete security in the Republic and for the first time in many years the people had been able to go about their work without fear of disturbance.

The account of the American occupation will be found in preceding YEAR BOOKS, but a brief summary here may be convenient. The United States government interfered in the affairs of the Dominican Republic in November, 1916, with the avowed purpose of restoring order and the protection of life and property. It declared at that time in a proclamation dated Nov. 29, 1916, that it had no design of destroying the sovereign-

ty of the Republic. Conditions, however, were so disturbed as to imperil the lives and property of natives and foreigners alike. Moreover, the Dominican government had repeatedly failed to observe its obligations to the United States under the treaty of 1907. While the American government had tried to aid the Dominican government, the latter had not adopted the measures suggested. The financial situation of the Republic was very unsatisfactory. Its account was overdrawn and the salaries of employees were greatly in arrears. The American military government took charge of the finances, paid all the debts, and met all the expenses of the government. In the course of four years of occupation the finances had been restored to order and the general condition was as above indicated. In 1907 the treaty between the two governments had provided that the customs revenues of the Dominican Republic should be collected by a receiver appointed by the President of the United States in order to guarantee the payment of interest and of the debt, and the Dominican government agreed not to increase its public debt without the approval of the American government. For a time conditions improved, but revolutionary disturbances caused the Dominican government to increase its debt in order to raise funds for the restoration of order. It thus violated the treaty obligation. In 1915 a new treaty was formed providing for the continuance of American control over the customs and for the control by Americans over the constabulary. The Dominican government refused to agree to this and at about the same time the Dominican Minister of War, Arias, headed a revolutionary movement. The revolutionists got possession of the fortress of the city of Santo Domingo, while the loyal forces continued to control the country surrounding the capital. Civil war was beginning when with the consent of President Jimenez, naval forces of the United States were landed in the Republic. The Dominican president soon afterwards resigned and American marines were landed at several ports. A new Dominican president was elected, but the United States would not recognize him because he refused to accept a treaty like that proposed in 1915 which would guarantee the maintenance of order and the honest administration of the finances. In the deadlock that followed, the United States government ordered the naval officer in command to assume the direction of affairs and as the Dominican government persisted in its refusal the American government proclaimed through Captain H. S. Knapp of the United States Navy, Nov. 28, 1916, the establishment of temporary military government. The withdrawal of the American troops pursuant to the policy above described, was under consideration at the close of the year. The Secretary of the Navy announced, December 27, that several months would pass before the American marines could be withdrawn. At that time, a committee was planned for the revision of the laws and for the framing of new regulations according a share in the government to the inhabitants, and it was announced that Rear-Admiral Snowden, the naval governor, would name the members of the committee in accordance with the recommendations of the American government.

DON, WILLIAM GERARD. British surgeon, died, July 27. He was born Jan. 10, 1836, studied

at Aberdeen and Edinburgh and took his medical degree from the University of Edinburgh in 1857. After a brief service in the navy he entered the army and served in the Indian Mutiny, winning a medal and being mentioned in despatches. He was engaged in fitting out hospital ships for the Egyptian expedition of 1882. For 17 years he served as the medical officer on the London recruiting staff. He wrote largely for medical and other periodicals and published a number of books on genealogy and some archaeological notes on early Scotland.

DONCASTER, LEONARD. British zoölogist, died, May 28. He was born at Sheffield, Dec. 31, 1877, and graduated with honors at Cambridge. He lectured on zoölogy at Birmingham University, 1906-15, and was a fellow of King's College, Cambridge, in 1910. In 1915 he received the Trail medal of the Linnæan Society. He published numerous papers on zoölogical subjects in the important medical journals and wrote *Heredity in the Light of Recent Research* (1910); and *The Determination of Sex* (1914).

DOUGHERTY, J. HAMPDEN. Lawyer, died at Bayonne, N. J., January 12. He was born in New York City, Dec. 17, 1849, and graduated at the college of the City of New York in 1871; studied law and medicine at Columbia and began the practice of law in 1874. After 1908 he practiced alone. He was prominent in many movements for reform and frequently appeared before commissions of investigation. Under Mayor Low he was commissioner of water supply, etc., and he was a member of the Charter Revision Commission in 1907-1908. He was active in the campaign to secure workmen's compensation in New York State and the ratification of the income tax amendment. Among his writings may be mentioned, *The Electoral System of the United States* (1906); *Power of Federal Judiciary over Legislation* (1912), and *Constitutional History of New York State* (1911 to 1915).

DOURINE. See VETERINARY MEDICINE.

DOWNHAM, WILLIAM HAYES FISCHER, FIRST BARON. British official, died in London, July 2. He was born in 1853 and educated at Oxford, where he graduated in 1876, with honors. He went into politics as a Conservative and became private secretary to Sir Michael Hicks Beach and afterwards to Mr. Balfour. In 1892 he entered Parliament where he continued to sit until the end of 1910 with the exception of a brief period following the election of 1906. He was Junior Lord of the Treasury, 1895 to 1902; financial secretary to the Treasury, 1902-03; leader of the Municipal Reform Party in the London County Council in 1909-10; and Chairman of the Council in 1919.

DRAINAGE. See RECLAMATION.

DRAKE UNIVERSITY. An institution of higher learning situated at Des Moines, Iowa, founded in 1881. Enrollment in 1920 was 2130 and there were 83 members in the faculty. President, Arthur Holmes.

DRAMA, AMERICAN AND ENGLISH. With the recession of the war into the past, the theatre in English-speaking countries returned in 1920 toward its normal condition, slowly and falteringly in England, but with such rapid strides in America that the season 1920-1921 gave promise before it was half over of being the most brilliant in recent years. While the London

stage seemed still to be suffering from the retrenchment due to war and labor difficulties, the American theatre took up the course of its development where the war had halted it and went forward, with an assurance hardly to be expected after the comparative indifference of the first year following the armistice, under such differing stimuli as the emergence of a new native playwright of the first rank, Eugene O'Neill; the ambitious projects of Arthur Hopkins; the discovery by the English-speaking stage of Jacob Ben-Ami, who seems destined to follow his record in the Yiddish theatres of the East Side with a brilliant career in his new-found tongue; the fresh impulses and vitality of the so-called new stagecraft as typified by Robert Edmond Jones, Norman-Bel Geddes, and others; the growing importance and influence of various institutional and experimental groups such as the Theatre Guild, the Provincetown Players, the Neighborhood Playhouse, and the Jewish Art Theatre, in New York, and scores of more or less significant little theatres scattered all over the country; and finally the example accorded by the importation of some of the best plays, both old and new, of John Galsworthy, Bernard Shaw, and St. John Ervine.

Few of the forces operating in the American theatre or movements either parallel or of equal moment distinguished the activities of the British stage. Enormous rents in the established theatres stifled almost everything but the most ordinary commercial ventures, forcing Nigel Playfair to continue to operate in the theatre in Hammer-smith where John Drinkwater's *Abraham Lincoln* had found haven the year before, while Robert Atkins rehabilitated the Old Vic for a season of Shakespeare and the classics and J. B. Fagan remodelled the Court Theatre for the same purpose. Barrie and Galsworthy returned to the ranks of producing playwrights with *Mary Rose* and *The Skin Game*, respectively; Lennox Robinson, of the Abbey Theatre, Dublin, added to his reputation with a new comedy, *The White-Headed Boy*; the Little Theatre became London's Grand Guignol, devoted to unusual one-act plays; Basil Dean came to the fore among the younger producers; and Moscovitch left New York's East Side to win a British name for himself in Shylock and other rôles; but for the most part the West End theatres were content with minor plays and undistinguished revivals.

Probably the most distinctive event in the American theatre was the definite arrival of Eugene O'Neill in the front rank of contemporary native playwrights, an event marked by Richard Bennett's production of his first full length tragedy, *Beyond the Horizon*, and reenforced later in the year by the disclosure of *The Emperor Jones* and *Diff'rent* on the stage of the Provincetown Players. O'Neill's one-act plays had been introduced by this pioneer group to a small public, but until *Beyond the Horizon* was presented it was uncertain whether he could master the more exacting technique of the longer form. The general verdict of approval, backed up by the award of the Columbia University Pulitzer Prize of \$1000 for the best original play by an American performed during the season in New York, dispelled any doubts on that point, and the few who hesitated to acclaim O'Neill on account of a certain looseness of construction in *Beyond the Horizon*, fell into line with the dis-

closure of still more remarkable gifts in his later plays, for *The Emperor Jones* revealed an imaginative strain more sure and more original than the American drama had yet produced, while *Diff'rent* proved its author to be possessed of a command of dramatic realism unsurpassed in the English tongue. Nearly all of O'Neill's plays are on or by or of the sea, the heritage of his own life on the wave. Most of them are tragic in dénouement. But the outstanding individual characteristic of O'Neill's work is the lyric quality of his dialogue, whereby his speech must be spoken to attain its full effect, a quality which allies him more nearly with Synge than any other modern playwright.

The movement toward a simpler, more appropriate and more eloquent mounting of plays, which has come to be known as the new stagecraft, received definite impetus and encouragement in the course of the year. Perhaps the most notable single event of the kind was the setting which Robert Edmond Jones designed for Arthur Hopkin's revival of *Richard III*, with John Barrymore in the leading rôle. Jones conceived the old chronicle play as a panorama of scenes with the massive bulk of the Tower of London looming up behind them all, a device which knit these scenes together in the "stylized" manner of Reinhardt and the Russians. The settings which Jones designed for Walter Hampden's production of Percy MacKaye's *George Washington* were in this same manner, and other examples included the work of James Reynolds for *The Greenwich Village Follies* of 1920, of Rollo Peters for William Faversham's production of *The Prince and the Pauper*, of C. Raymond Johnson for Maurice Browne's revival of Euripides' *Medea*, and of Norman-Bel Geddes for the revival of the light opera, *Erminie*.

The effort to improve the standards of plays and production outside the commercial theatre likewise encountered encouraging success. The Theatre Guild, successor to the Washington Square Players, continued its second season at the Garrick Theatre, New York, and began its third with a record fully upholding its earlier prospects and accomplishments. In the later winter and spring, Tolstoy's *The Power of Darkness* in an inferior production was added to the repertory, but this failure was retrieved by a masterly presentation of *Jane Clegg*, by St. John G. Ervine, whose *John Ferguson* had previously established the Guild on firm ground both financially and artistically. Strindberg's *The Dance of Death* was ably presented for subscribers only. The new season was opened in the fall with an interesting production of David Pinski's pungent satiric comedy, *The Treasure*, which was followed by the Guild's most ambitious project, the world premiere of Bernard Shaw's brilliant comedy of war-time England, *Heartbreak House*. If the Guild had done nothing else but this, it would have justified its existence. Other institutional and experimental theatres which did notable work in New York were the Provincetown Players, the Neighborhood Playhouse, and the Jewish Art Theatre. The Provincetown Players remodelled their little auditorium in Macdougall Street, New York, installing a *kuppelhorizont* or plaster horizon similar to those of the German stages, and commanded wider attention than ever before with their productions of O'Neill's plays, *The Emperor Jones* and *Diff'rent*. The Neighborhood Playhouse likewise enlarged its clientèle

through the first American production of John Galsworthy's *The Mob* at the hands of a visiting professional company and through the resident company's performance of Andreyeff's *The Beautiful Sabine Women*. The Jewish Art Theatre, at the old Garden, continued through the early months of the year the excellent work which had marked its opening in the fall of 1919, adding Peretz Hirschbein's pastoral fantasy, *Green Fields*, to its repertory. The loss of Jacob Ben-Ami to the English-speaking stage, however, was not compensated in the fall by the arrival from Germany of Rudolph Schildkraut as a new leader for the company, and the standards of acting and production and the choice of plays were not maintained through the later months of the year, although Schildkraut's Shylock attracted deserved praise. The Little Theatre movement progressed by leaps and bounds all over the country with the formation of many new community groups, and although much of the work was crudely amateurish in nature, the underlying impulses pointed to a dramatic independence which bodes well for the future.

The arrival of Jacob Ben-Ami on the English-speaking stage, already referred to, was the year's event in the discovery of fresh acting talent for the American theatre. This young Russian Jewish player had come to New York in 1914, and had struggled against bitter odds in the Yiddish theatres of the East Side. At the Jewish Art Theatre he was finally able to put into practice some of the high ideals which he had brought from the Russian theatre and from that vantage ground he was drawn by Arthur Hopkins to a wider public on Broadway. His first play in his new tongue was Sven Lange's *Samson and Delilah*, of the Danish post-Ibsen school, distinctly inferior to his own powers but affording a bridge from Yiddish to English inasmuch as it was one of his most successful items in the repertory at the Garden. The intense tragic power and imaginative gifts of this player give him every assurance of a place in the American theatre comparable only to that which Richard Mansfield held and which no one in the meantime has challenged except John Barrymore. Barrymore added to his own reputation with his picturesque and incisive characterization of Richard III, but illness took him temporarily away from the stage mid-year. Many of the younger players advanced their reputation appreciably, but the only other discovery of unsuspected talent of great proportions was that of Charles S. Gilpin, a negro, whose astonishing impersonation of the title rôle in O'Neill's *The Emperor Jones*, fulfilled that play's inherent possibilities.

A still greater gap yawned between New York and the rest of the country, and the problem of "the road" assumed discouraging aspects. Chief among the causes for this gap was the sharp increase in railroad rates which made it almost prohibitive to transport large companies and elaborate productions from city to city. The result was not only a decrease in the number of traveling productions but a deterioration in the standards maintained, to which the other increasingly expensive factors of play production contributed. Managers, who used to force the run of plays in New York in the hope of recouping on the road had to devise means to make the New York engagement pay for itself and prices of admission, already expanded, were forced still

higher. The only relief from this impasse, for which the vogue of the motion picture in the smaller cities is partly responsible, seemed to be a return to pre-war financial conditions or the development of community and repertory theatres in the larger cities and even in the smaller communities where important plays may be presented simultaneously with their run in New York. Relations between the actors and the managers, which culminated the previous year in the Equity strike, were unruffled, proving the soundness of the conditions which the strike achieved. Something of a flurry was caused by the announcement of certain motion picture corporations that they would enter the theatrical business and produce plays which would be primarily suited for later use on the film, but the general course of the theatre did not seem to be greatly influenced thereby.

Aside from those plays already mentioned and characterized, there were several new plays of native authorship admirable in their particular genres. Porter Emerson Browne, author of *A Fool There Was*, and other conventional pieces of dramatic carpentry, revealed an unsuspected satiric and whimsical gift in *The Bad Man*, a melodramatic comedy of the Mexican border with an intriguing infusion of ethical contrasts between the civilized and the bandit point of view in which Holbrook Blinn impersonated a replica of Pancho Villa. Frank Craven showed himself to be a keen and faithful observer of native small town types in writing and acting in *The First Year*, a worthy successor to his earlier comedy, *Too Many Cooks*. Gilda Varese is another player who composed her own piece, *Enter Madame*, a comedy of the artistic temperament, coming into her own thereby after a discouraging series of attempts to find a rôle suitable to her peculiar gifts. *Enter Madame* served likewise to introduce a new producing manager of taste and perspicacity in the person of Brock Pemberton, who obtained his schooling under Arthur Hopkins. *Mama's Affair* was an amusing and expert comedy which gave promise of a fresh talent in our theatre until its author, Rachel Barton Butler, died suddenly in the autumn. *The Bat*, written jointly by Mary Roberts Rinehart and Avery Hopwood, was the most shrewdly contrived mystery melodrama of the year.

Among the abler plays of the year were: *Big Game*, an intense and well-built western melodrama by Willard Robertson and Kilbourn Gordon; *He and She*, a comedy on the place of woman in modern life by Rachel Crothers, in which the author enacted the leading rôle; *The Hottentot*, a typical William Collier farce in which Victor Mapes collaborated with Mr. Collier in composition; *Sophie*, a smart and sophisticated comedy of eighteenth century France, by Philip Moeller with Emily Stevens in the title rôle; *Not So Long Ago*, a romantic comedy of the New York of a generation ago, by Arthur Richman; *Footloose*, a play made by Zoë Akins from *Forget-Me-Not*, a story, by H. C. Merivale and F. C. Grove, with Emily Stevens in the rôle of Stephanie, Marquise de Mohrivart; *Martinique*, a picturesque romance of the French West Indies, by Laurence Eyre; *Come Seven*, a comedy of negro life made by Octavus Roy Cohen from his own short stories; *Crooked Gamblers*, a Wall Street melodrama, by Samuel Shipman and Percival Wilde with Taylor Holmes in the leading rôle; *Opportunity*, another Wall Street play by

James Crane; *The Lady of the Lamp*, a curious blend of Broadway banalities and fascinating Chinese legend, by Earl Carroll; *One*, Edward Knoblock's latest play, concerning dual personality and having Frances Starr in a double rôle; *Little Old New York*, a reconstruction of the New York of a hundred years ago by Rida Johnson Young; *Call the Doctor*, David Belasco's production of an amusing study of domestic difficulties, by Jean Archibald; *Welcome Stranger*, a comedy of the struggles of a Jewish invader of a small town, by Aaron Hoffman; *Immodest Violet*, a satiric comedy, by David Carb; *The Tavern*, a burlesque on melodrama, by Cora Dick Gantt and George M. Cohan with Arnold Daly in the leading rôle; *Three Live Ghosts*, an after-the-war farce, by Frederic S. Isham; *The Meanest Man in the World*, a comedy, by George M. Cohan, in which the author himself played; *The Unwritten Chapter*, a play, by Samuel Shipman and Victor Victor, dealing with the Revolutionary War character of Haym Solomon; *Just Suppose*, a sentimental and imaginary episode in the visit of the Prince of Wales to the United States, by A. E. Thomas; *Bab*, a dramatization by Edward Childs Carpenter of the "sub-deb" stories of Mary Roberts Rinehart; *Rollo's Wild Oat*, a farce by Clare Kummer; *Cornered*, a comedy, by Dodson Mitchell with Madge Kennedy in the leading part; and *Miss Lulu Bett*, Zona Gale's dramatization of her own novel.

Other plays of the year were: *No More Blondes*, by Otto Harbach; *The Ruined Lady*, by Frances Nordstrom, acted by Grace George; *Pietro*, written for Otis Skinner by Mrs. Skinner and Jules Eckert Goodman; *The Cat Bird*, by Rupert Hughes, used by John Drew; *The Wonderful Thing*, by Lillian Trimble Bradley; *The Ouija Board*, by Crane Wilbur; *The Hole in the Wall*, by Fred Jackson; *Macushla*, by Rida Johnson Young; *An Innocent Idea*, by Martin Brown; *Ladies' Night*, by Charlton Andrews and Avery Hopwood; *Scrambled Wives*, by Adelaide Matthews and Martin H. Stanley; *The Charm School*, by Margaret Mayo and Robert Milton; *The Cave Girl*, by Guy Bolton and George Middleton; *Genius and the Crowd*, by John J. McIntyre and Francis Hill; *Blue Bonnet*, by George Scarborough; *The Mirage*, by Edgar Selwyn; *The Outrageous Mrs. Palmer*, by Harry Wagstaff Gribble; *Daddy Dumplings*, by Earl Carroll; and *The Broken Wing*, by Charles Goddard and Paul Dickey.

Inferior plays produced during the year were: *The Acquittal*, *The Light of the World*, *Trimmed in Scarlet*, *Shavings*, *The Blue Flame*, *Mrs. Jimmie Thompson*, *All Souls Eve*, *His Chinese Wife*, *The Fall and Rise of Susan Lennox*, *Nightshade*, *Seeing Things*, *The Checkerboard*, *A Man of the People*, *Anna Ascends*, *Poldekkin*, and *When We Are Young*.

In addition to those already cited, the most important plays from foreign sources presented in the American theatre were: *The Passion Flower*, from the Spanish of Benavente; *The Tragedy of Nan*, by John Masefield; *The Letter of the Law (La Robe Rouge)*, and *The Americans in France*, from the French of Brieux; *The Skin Game*, by John Galsworthy; *Mixed Marriage*, by St. John G. Ervine; and *Deburau*, from the French of Sacha Guitry. Other plays from foreign sources were: *The Purple Mask*, adapted from the French for Leo Ditrichstein, by Matheson Lang; *Sacred and Profane Love*, by Arnold Ben-

nett, in which Elsie Ferguson played; *Spanish Love*, adapted from the Spanish, by Mary Roberts Rinehart and Avery Hopwood; *The Woman in Bronze*, adapted for Margaret Anglin, by Paul Kester from the French of Kistemaekers; *Happy-Go-Lucky*, by Ian Hay Beith, known in London as *Tillie of Bloomsbury*; *Don't Tell*, by Graham Moffat; *Thy Name Is Woman*, from Spanish and German sources; *Mary Rose*, Sir James M. Barrie's latest play; *French Leave*, by Reginald Berkeley; *The Whispering Well*, by F. H. Rose; *Mecca*, by Oscar Asche; *An Enemy of the People*, by Ibsen; *Youth*, from the German of Max Halbe; and *The Young Visitors*, from the story of Daisy Ashford.

Important revivals in addition to *Richard III* were: Euripides' *Medea*, at the hands of Maurice Browne; *The Beggar's Opera*, by a company imported from London by Arthur Hopkins; and *The Piper* of Josephine Preston Peabody Marks.

Several plays extended their run into 1920 from 1919, and one of them, *Lightnin'*, from 1918. Among them were: *Abraham Lincoln*, by John Drinkwater; *The Famous Mrs. Fair*, by James Forbes; *The Gold Diggers*, by Avery Hopwood; and *A Night Lodging*, by Maxim Gorky.

The most notable light musical plays of the season were: the revivals of *Florodora* and *Erminie*; Victor Herbert's *My Golden Girl* and *The Girl in the Spotlight*; *Lassie*, made from the comedy, *Kitty MacKay*; the Ziegfeld *Follies* of 1920; the *Greenwich Village Follies* of 1920; *What's In a Name?*; *The Night Boat*, from the French of Bisson; and *As You Were*, from the French of Rip. See LITERATURE, ENGLISH AND AMERICAN; FRENCH LITERATURE; GERMAN LITERATURE.

DRAPER, HERBERT JAMES. British painter, died in London in the latter part of September. He was born in London, studied in Paris and Rome, won the Royal Academy gold medal, and after 1890 exhibited pictures every year in the Royal Academy. The best known of his paintings was the "Lament for Icarus." During his later years he devoted himself more especially to portrait painting. Among his other paintings may be mentioned "The Sea Maiden," "Vintage Morn," "The Golden Fleece," "Tristram and Yseult," "Calypso's Isle," "The Foam Sprite," "The Dawn Star," "Ulysses and the Sirens." His pictures are widely distributed in the galleries of London and other English cities and throughout the British possessions.

DUBOIS, JAMES T. Diplomat, died at Hallstead, Pa., May 27. He was born at Hallstead, April 17, 1851, studied at Cornell and went into newspaper work, but in 1881 became consul in Germany. He was afterwards consul-general in Switzerland, and in the Straits Settlements and from 1911 to 1913, American Minister to Colombia. He wrote *Fun and Pathos of One Life*, and *Life of Ex-Speaker Galusha A. Grow*.

DUELL, CHARLES HOLLAND. Former Commissioner of Patents, died at Yonkers, N. Y., January 29. He was born at Cortland, N. Y., April 13, 1850, graduated at Hamilton College in 1871 and practiced law in New York City and in Syracuse, N. Y. He was a member of the New York Assembly in 1878 to 1880, and from 1898 to 1901, he was United States Commissioner of Patents. He was prominent as a Republican in politics, having been the Treasurer of the Republican National Committee in 1904, and a presidential elector at large from New York in

1908. In 1912 he was chairman of the New York City Roosevelt Committee. He contributed articles on patents to magazines and works of reference.

DUGRO, P (HILIP) HENRY. Judge, died March 1. He was born in New York City, Oct. 2, 1855; graduated at Columbia, 1876; and was admitted to the bar in 1878. He was member of Congress, 1881-83, and justice of the Superior Court of New York for the 10 years following 1886. He was appointed to the Supreme Court of New York State for the terms 1896-1928. Among his other activities were the building of hotels and the organization of the Union Square Bank in New York City. In politics he was a Democrat.

DULUTH, MINN. See CITY PLANNING.

DUNCAN, EDMONSTOUNE. English musician, died in Sale, Cheshire, June 28. He was born there in 1860. He wrote much chamber-music, choral works with orchestra, an opera, songs and pieces for organ and piano. He also was the author of a biography of Schubert, a *History of Music*, *Story of English Minstrelsy*, and other books.

DUNKARDS or DUNKERS. See BRETHREN, CHURCH OF THE.

DURHAM, BISHOP OF (HANDLEY CARR GLYN MOULE). British prelate, died at Cambridge, May 8. He was born at Dorchester in December, 1841, and graduated with distinction at Trinity College, Cambridge, where he was elected a fellow in 1865. In 1880 he was chosen the first principal of Ridley Hall at Cambridge, an institution resulting from the movement on the part of the Evangelical clergy to provide means for theological education in the universities. Meanwhile he had become widely known as a religious writer by his *Commentaries on the Epistles to the Romans* and other writings. He was appointed professor of divinity at Cambridge in 1899, and soon afterwards was raised to the vacant see of Durham. Among his other publications may be mentioned: *Outlines of Christian Doctrines* (1899); and an edition of Bishop Ridley's *On The Lord's Supper*.

DUTCH EAST INDIES. Islands in the Pacific belonging to the Netherlands, situated between 6° N. and 11° S. latitude and between 95° and 141° E. longitude. Capital, Batavia.

AREA AND POPULATION. The islands consist of two main divisions: first, Java, comprising 16 residences and Madura or Madoera with one residence; second, the outposts, comprising 17 provinces. The approximate area is 735,000 square miles and the total population according to the official estimate of Jan. 1, 1918, was 47,000,000. The population of the four principal towns in 1918 were: Batavia, 234,697, of whom 24,000 were Europeans; Soerabaya, 160,801; Soeracarta, 137,832; Samerang, 106,852.

PRODUCTION. Area (end of 1918) under rice, was 2,288,893 acres; corn 2,287,743 acres; cassava, 1,134,418 acres; arachis, 125,600 acres; soya beans, 32,252 acres; other secondary crops, 745,752 acres; sugar cane, 23,954; tobacco, 12,423 acres; indigo, 6809 acres; and capsicum, 13,359 acres. Government coffee plantations in 1918 produced 2792 tons and private plantations produced 68,515 tons. Tobacco in 1918 (Java) 27,887,000 kilogrammes and (Sumatra), 23,497,000 kilogrammes, a total of 51,384,000 kilogrammes; cinchona in kilogrammes amounted to 8,091,190. The production of tea in the country

for 1918 was estimated at 31,931,087 kilogrammes. Cacao (Java, 1918), 978,717 kilogrammes. The government tin mines of Banca and others yielded in 1918, 19,703 tons. The yield of the principal coal mines in Java, Sumatra, and Borneo in 1918 was 835,154 tons. Petroleum and other mineral oils (1918), came to 1,764,203,000 kilogrammes. Gold, silver, diamonds, copper, and manganese are mined. In 1918, the lands belonging to the companies had an acreage of 3,641,954 of which 1,415,884 were on the island of Java.

COMMERCE. Government and private trade, merchandise and specie are given below for 1917 and 1918 in guilders.

IMPORTS							
Year	Merchandise	Specie	Total	Merchandise	Specie	Total	Grand total
1917	20,361,000	1,600,000	21,961,000	467,019,000	7,705,000	474,724,000	496,685,000
1918	28,369,577	3,050,014	31,419,591	580,415,870	5,968,390	586,384,170	567,803,761
EXPORTS							
1917	1,670,000	149,000	1,819,000	785,110,000	6,300,000	791,410,000	793,229,000
1918	8,710,887	8,710,887	675,900,381	232,718	676,133,049	679,843,886

The chief imports according to value in 1918 were rice, coal, manufactured articles, and kerosene. Singapore, Japan, the United Kingdom, and the United States were the leading countries of origin of imports. The chief countries of destination for the exports were in the order of their value, Singapore, United States, Japan, British India, and Hongkong. There is a large exportation of rice to China and Borneo. In 1918 there entered at the ports, 7543 steamships and 6350 sailing vessels with a tonnage of 2,752,193 and 360,416 respectively. The railway and tramway mileage in 1918 totaled about 3914, of which 3130 was in Java. During the year announcement was made at Batavia, Java, of plans for improvements to the railways of the Dutch East Indies, involving the construction of 6944 miles of new lines. The program outlined was to require ten years for completion and would embrace work in Java, Sumatra, Celebes, Borneo, and other islands of the archipelago.

FINANCE AND GOVERNMENT. The revenue and expenditure expressed in guilders for 1920 were as follows: Revenue, 485,880,715; expenditure, 565,690,216, a deficit of 79,809,501. The territory is under the sovereignty of the Netherlands, consisting partly of lands held directly under the government and partly of lands under subject native states. The chief of the administration is the governor-general, who is assisted by a council of five members. The governor-general has legislative as well as executive powers, and the functions of the council are partly legislative and partly advisory. Owing to reforms in the agrarian law in 1870, there has been a large extension of agriculture. The acquisition of uncultivated land has been made easy and a considerable acreage is held by companies of Europeans and other foreigners and by foreign individuals. In 1920, the governor-general was Dr. J. P. Count van Limburg Stirum, who was appointed, Oct. 28, 1915.

DUTCH GUIANA OR SURINAM. A colony of the Netherlands situated on the northern coast of South America; bounded on the north by the Atlantic Ocean, on the east by the River Marwijne, which separates it from French Guiana; on the west by the River Corantyn, which separates it from British Guiana; total area, 46,060 square miles; population Jan. 1, 1919, 107,827, exclusive of negroes and Indians

living in the forests. Capital, Paramaribo, with a population of 36,726. In 1918 there were 30 public schools with 3,806 pupils and 43 private schools with 6724 pupils. There is also a government normal school. In 1918, the religious denominations were: Moravian Brethren, 25,148; Roman Catholics, 19,460; Reformed and Lutheran, 10,083; Hindus, 20,814; Mohammedans, 12,532. Sugar production in 1918 amounted to 12,085,886 kilogrammes; cacao, 1,887,700 kilogrammes; bananas, 733,800 bunches; coffee, 1,853,000 kilogrammes; rice, 3,754,800 kilogrammes; corn, 1,873,600 kilogrammes; rum, 1,115,736 litres; and molasses, 14,040 litres. Imports in 1918 amounted to 1,157,727 guilders.

The following table shows exports to principal countries of destination in 1918 and 1919:

Countries of destination	1918	1919
Barbados	\$9,549	\$17,372
British Guiana	1,815,588	692,092
Curacao	28,278	10,470
French Guiana	326,300	287,597
Netherlands	1,495,864
Trinidad	648
United Kingdom	85,114	126,506
United States	1,122,231	806,202
France	158,822
All other countries	75
Total	\$2,832,005	\$3,595,148

Both exports and imports of Dutch Guiana for 1919 show an increase in value as compared with 1918; general business conditions were considered good, the prices obtained for the colony's exports continued high, and wages were raised in a number of cases, giving more buying power to the general population, as shown by an increase of \$1,215,909 in the imports for the year.

Local revenue (1920), 3,527,000 guilders; subvention, 1,555,000 guilders; expenditure, 5,152,000 guilders. Governor in 1920, G. J. Staal.

DUTCH REFORMED CHURCH. See REFORMED CHURCH IN AMERICA.

DUTCH WEST INDIES. This term includes CURACAO AND DUTCH GUINEA (q.v.).

DUVALL, WILLIAM PENN. Soldier, died at Coronado, Cal., March 1. He was born in St. Mary's county, Md., Jan. 13, 1841, graduated at the United States Military Academy in 1869 and by March 8, 1898, had risen to the rank of captain of artillery. He was made Inspector-General of volunteers May 17, 1898, and honorably discharged in July of that year. He subsequently served as volunteer, but reentered the regular army in 1901 and on March 2, 1906, was appointed Brigadier-General. In the following year he was made a Major-General and from 1909 to the end of 1910 was assistant to the Chief of Staff in command in the Philippines. He retired in 1911, but was re-assigned to active duty Aug. 12, 1917, when he was placed in command of the 'Southeastern Department.

DYER, ISADORE. American physician, head of the medical school at Tulane University, and celebrated for medical discoveries in leprosy and other malignant skin diseases, died at New Orleans, La., October 12. He was born at Galveston, Texas, Nov. 2, 1865, and graduated at the

Sheffield Scientific School in 1887 and from the Tulane University Medical School in 1889. He was a lecturer on diseases of the skin for 13 years, following 1892 at the Tulane Medical School of which he became Dean in 1908, holding that office till his death. He was the consulting dermatologist of many hospitals and he founded in 1894, and became the first president of, the Louisiana Lepers Home. On July 5, 1908, he was appointed Lieutenant in the army medical reserve corps and became major April 9, 1917. The list of the various scientific and other associations of which he was either member or officer and which includes some of the most important in the world is too long for mention here. He was an authority not only on leprosy, but on cancer among other skin diseases.

DYNAMO ELECTRIC MACHINERY.

During the past year the active demand for machinery of this class that had been stimulated by war conditions was generally satisfied and a number of large contracts, the completion of which had been delayed by lack of material, and difficulty with labor were completed. As regards the size of machinery, none of the generators constructed exceeded in size any formerly built. Many orders, however, called for machines rated between 20,000 kw. and 35,000 kw., and generating stations were completing installations for which they had planned three or four years earlier. At Niagara Falls, N. Y., the extension of the existing generating plant on the American side of the river included the completion of the largest generators in the world. These three machines were rated at 35,000 kw., but were capable of operating at the rate of 40,000 kw. Their design and installation required some special studies, owing to the enormous weight of the rotating parts. It was expected that all the additional energy thus produced would be promptly utilized by the various industries that had been attracted to this district in recent years. See ELECTRIC POWER; TRANSMISSION OF.

An interesting feature of the concentration of power in one generating plant was the Fisk Street station in Chicago, to which additions had been made from time to time, until during the past year, its total capacity had reached 230,000 kw.

EARTHQUAKES IN 1920. The year started with a very severe earthquake in southern Mexico, chiefly affecting the region around Vera Cruz but being felt as far as the City of Mexico. The centre of disturbance was the volcano Orizaba, which has renewed its activity. Much damage was done and many people were killed or injured. A severe shock was felt in the Canary Islands next day but this, although following immediately, probably had no connection with the Mexican disturbance. On January 22d Vera Cruz again suffered a strong shock but the damage suffered was comparatively slight. Light shocks were felt on succeeding days along the Pacific Coast, being particularly noticeable at Victoria, B. C., on the 24th. A few brick walls and chimneys were shaken down.

February was marked by minor shocks along the Pacific Coast. The cable off Callao, Peru, was broken on February 28th. On February 3d the state of Minas Geraes, Brazil, suffered a severe shock which caused some damage and loss of life. On February 19th considerable damage was done by a disturbance in the Province of Andalusia southern Spain, but fortunately no

lives were lost. In the latter part of February severe shocks were felt in Transcaucasia in the vicinity of Gori, many lives were lost, and several villages were wholly destroyed. A report from Tahiti states that shocks there also continue to be felt almost every week and frequently every day.

On May 14th central Italy was greatly disturbed in the region around Udine, much damage was done, and many lives lost. Renewed shocks occurred on June 4th near Ferrara.

In the Pacific region the chief seismologic disturbances were the earthquake at Inglewood, Cal., where some slight damage was done on June 21st, and the severe shock in Formosa on June 5th which caused several deaths. The Inglewood earthquake was studied by Stephen Taber who located its origin a short distance west of Inglewood. The maximum intensity was between VIII and IX of the Rossi-Forrel scale. The disturbance he believes to be due to a small displacement along the Inglewood San Onofre Fault, which is roughly parallel to the coast. Taber's memoir on the occurrence is published in the bulletin of the Seismological Society of America for September, 1920. Numerous shocks disturbed the whole Pacific Coast from Alaska to Santiago de Chile about July 25th.

During August Popocatepetl burst into renewed activity and accompanying it were some seismic disturbances in southern Mexico. These disturbances continued down the Pacific Coast of South America and were particularly strong in southern Chile.

On September 7th the city of Carrara, Italy, was disturbed by a severe earthquake. In the surrounding country upwards of 100 towns and villages were destroyed or damaged, hundreds of lives were lost, and thousands of persons were injured. This was quite the most appalling seismic disaster of the year unless we except the earthquake in Kansu, western China, which occurred on December 27th. A large part of the province was devastated but owing to meagre reports the exact extent of the damage is as yet unknown. An interesting fact is that the seismologists had ascribed the occurrence registered on this date to Alaska instead of western China.

EAST AFRICA PROTECTORATE.

A British dependency now having practically the status of a crown colony extending from the former German colony of East Africa to Abyssinia and Italian Somaliland and from the river Umba to the river Juba, reaching inland as far as the borders of Uganda. For administrative purposes it is divided into seven provinces, and a tract of territory not as yet completely organized, lying to the south; the provinces are each under a provincial commissioner and are in turn divided into districts and sub-districts. The provinces with their respective capitals are as follows: Seyidie (Mombasa); Ukamba (Nairobi); Tanaland (Lamu); Jubaland (Kismayu); Kenya (Nyeri); Naivasha (Naivasha); and Nyanza (Kisumu). It was placed under the control of a governor and commander-in-chief, Nov. 9, 1906, a previous decree having established an executive and a legislative council. By ordinance of July, 1919, it was provided that the legislative council should consist of 11 representatives elected by the European community, two representatives of the Indian population and one of the Arab, three nominated members, and a large enough number of official members to give

a majority. The protectorate has an area of 246,822 square miles and a population estimated in 1919 at 2,807,000 including 5362 Europeans and 17,000 Asiatics. On the coast Swahilis and Arabs predominate. In the interior are races speaking the Bantu languages and still further inland are various non-Bantu tribes. The largest town is Mombasa, the terminus of the Uganda railway, with a population of about 30,000. The capital Nairobi had a population in 1919 estimated at 14,000 of whom 800 were Europeans and 3000 Indians. The agricultural products are tropical and include rice, cassava, cocoanuts, corn, and various native grains and flour; sugar, vehicles, tobacco, agricultural implements, etc. (See AGRICULTURAL EXPERIMENT STATIONS.)

Prior to April, 1917, the statistics for Uganda and East Africa were kept separately, but since that time the foreign trade of the two protectorates is shown under one head. The total value of commercial imports during the year ended March 31, 1918, was \$13,673,313, showing a decrease of \$1,043,582, or 7 per cent from the preceding year. The imports in 1916-17 amounted to \$14,716,895, the highest figures ever reached. The figures for 1917-18, however, show an increase of 31 per cent over the pre-war year of 1913-14. The exports during the fiscal years 1916, 1917, and 1918, respectively, were as follows: \$5,408,746, \$7,853,817, and \$8,477,147. The combined exports from the protectorates of Uganda and East Africa showed an increase of \$1,246,972 or about 20 per cent over 1917. There was a steady increase in past years in the export trade, until the figures of 1918 were \$6,000,000 above those of 1908. Prices were very high, but the annual exports increased enormously. A large portion of grain and foodstuffs which in former years were prominent in the exports of the two protectorates had to be retained for local consumption on account of the war and two seasons of famine. The United Kingdom has been the chief source of the imports and the chief country of destination for the exports.

The tonnage of vessels entered and cleared in 1918-19 was 922,653. A railway runs from Mombasa to Victoria, a distance of 618 miles, and is under state control. In reply to a question raised in the British Parliament on June 14, 1920, as to the railways which it was proposed to build in British East Africa or Uganda in the immediate future, and whether the construction of such railways would be placed to open tender, the official statement of the government was in part as follows:

"The new railways contemplated in eastern Africa are a line from Nakuru, on the Uganda Railway, through Eldama and Eldoret to Sov, on the northwest of the Uasin Gishu Plateau, and an extension of the Nairobi-Thika branch for a distance which is still under the consideration of the governor. It is not at present intended to place construction to open tender; the absence of detailed information as to the route of the Uasin Gishu Railway makes it necessary to arrange for a joint survey by the government and any contractor, and for this purpose it is impossible to negotiate with more than one firm at a time."

In 1920 it was decided to change the name to Kenya Colony, after the conspicuous feature of the landscape, the great volcanic mountain, Kenya, and to give it the status of a colony instead of a protectorate.

Governor at the beginning of 1920, Maj.-Gen. Sir E. Northey.

EAST CLEVELAND, OHIO. See CITY PLANNING.

ECKMAN, GEORGE PECK. Clergyman and author, died at Scranton, Pa., June 28. He was born at Gouldsborough, Jan. 8, 1860, studied at Wesleyan University and the Drew Theological Seminary, and was ordained to the Methodist Episcopal ministry in 1886. After some years of pastoral service, he joined the editorial staff of the *Christian Advocate* (1912) and was editor until 1915. Among his writings were: *The Young Man with a Programme* (1905); *Studies in the Gospel of St. John* (1907-08); *When Christ Comes Again* (1917).

ECONOMIC ASSOCIATION, AMERICAN. See POLITICAL ECONOMY.

ECUADOR. A South American republic, situated on the Pacific Coast with Colombia on the north and Peru on the south. Capital, Quito.

AREA AND POPULATION. Area estimated at 116,000 square miles, but owing to the boundary dispute with Peru, the figure is uncertain. The population in 1913 was 1,323,900; estimated, 1915, 2,000,000.

EDUCATION. Primary education is free and compulsory on all children beginning with the sixth year. In 1920, the public schools numbered 630. In 1919 the private schools numbered 40. The total enrollment of 1919 was about 48,505. There are national colleges in all the provinces with the exception of Esmeraldas.

PRODUCTION. Tropical farming is carried on in the lower river valleys and the coast regions; grazing, dairying, and the production of crops suitable to temperate climates are carried on in the uplands. Cocoa is the staple product, the production in 1919 being 22,474 hundredweight. Coffee is raised and exported in considerable quantities, and there has been until recently a considerable rubber export, but the rubber industry has declined on account of the defective methods of production. Other products include ivory nuts, tobacco, and sugar. Gold and silver are found, and petroleum is worked especially in the district of Santa Elena. The country is for the most part under forest and abounds in dyewoods, cinchona trees and other valuable woods. An industry almost excessively carried on in Ecuador has been the making of Panama hats. The attempt of the government to keep the production entirely within the country by the heavy import duty on the material has not been successful, a considerable portion being shipped to Peru which has become an important rival in the manufacture. In 1920 there were eight factories for cotton and woollen textiles in operation, giving an annual production of about 610,000 yards of cotton and 100,000 yards of woollen cloth. The product readily found a market within the country and fell far short of the demand. New factories were projected and the manufacture of woollens on a large scale was planned.

COMMERCE. The chief exports in 1917 were cocoa, which made up nearly two-thirds of the total and after that in their order of importance, hats, ivory nuts, and hides. The chief imports in 1917 were woollen goods, foodstuffs, hardware, and clothing. The director of statistics in 1920 published the figures for foreign commerce in 1918 as follows: Total trade, 44,140,256 sucres of which 16,690,720 were imports and 27,449,536 were exports. According to newspaper reports

exports in the fiscal year, 1919-20, consisted of 77,859,308 kilogrammes, valued at 43,167,695 sucres; imports of 39,730,065 kilogrammes valued at 24,269,019 sucres.

FINANCE. Gold is the standard and the monetary unit is the sucre, of which the value is one-tenth of the English pound or \$0.48665. The revenue and expenditure for 1917 to 1920, the figures for the last-named year being estimates, are as follows:

	1917-1918	1919	1920
Expenditure	£1,829,738	£1,685,980	£1,999,566
Revenue	1,660,537	1,685,980	1,999,566

On January 1, 1918, the foreign debt was £3,520,672, and the internal debt was £2,100,049.

SHIPPING AND RAILWAYS. Almost all shipping enters the port of Guayaquil. In 1918 the steam vessels entered numbered 160 with a tonnage of 195,958 and cleared 153 with a tonnage of 181,537. There is a railway from Duran to Quito, with a length of about 365 miles. During the year there was considerable discussion of a railway projected from the port of Esmeraldas in the direction of Guito. The proposed line was to connect with a road already constructed from Quito to Santo Domingo de los Colorados and will thus open up a short route from Quito to the coast. The projected road will render accessible a fertile area of some 1,000,000 acres. To about one-half of this land a concession had been awarded to the railway by the government. This concession included several valuable water power sites.

GOVERNMENT. Executive power is in a president elected directly by the people; legislative power is in a congress consisting of two houses, of which the Senate comprises 32 Senators chosen for four years and the second chamber, 48 deputies elected for two years. The basis of suffrage is the attainment of majority and the ability to read and write. The President is assisted by a cabinet of five ministers, namely: Interior, Foreign Affairs, Public Instruction, Finance, and War. The President at the beginning of 1920 was Dr. Alfredo Baquerizo Moreno, and the President-elect for the term Sept. 1, 1920, to August 31, 1924, was Señor Luis Tamajo, elected January 11.

HISTORY. According to reports, early in April, Italy had agreed to construct public works in Ecuador in return for a grant of a tobacco monopoly to an Italian company. The 100th anniversary of the union of Guayaquil with Ecuador and its independence was celebrated during the week beginning October 9th. The United States was represented by the cruiser *Cleveland*, and Great Britain by the warship *Weymouth*; an exhibition of arts and manufactures was held; and a congress of students met. There was also a meeting of Americans in the Pan-American Union Building.

EDDY, ARTHUR JEROME. Lawyer and writer, died July 21. He was born at Flint, Mich., Nov. 5, 1859; studied law at Harvard, and was admitted to the Illinois bar in 1890, practicing thereafter at Chicago. He wrote, *Recollections of Whistler*; an account of automobile travel; *The New Compensation* (1912); *The Warning* (play); *Bond Taxes by Bond Levies* (1917).

EDUCATION IN THE UNITED STATES. EFFICIENCY OF STATE SCHOOL SYSTEMS. Dr. Leonard P. Ayres, Director of the Department of Education of the Russell Sage Foundation, made public a report of a comparative study of State school systems. He took certain data that had been collected by the United States Bureau of Education and combined them into the statistical measurements of the school systems in the several States. The method employed was that of determining the index number,—the same device that is constantly used for measuring changes in wholesale and retail prices and rates of wages over long periods of time. Ten sets of data were used. These included per cent of school population attending school daily, average number of days schools were kept open, average annual expenditure of child attending, annual average attendance per teacher employed and expenditure per teacher for salaries. If any State were to achieve an index of 100, all of the school children of school age would have perfect attendance for 200 days each year, a third of the pupils would be in high school, there would be as many girls as boys in the high school, the annual expenditure per child would be \$100, teachers would receive \$100 per month for 12 months in the year, and the expenditures would amount to \$200 per month for each teacher employed.

The highest index in 1890 was 48.63 for the District of Columbia. Massachusetts came second with an index of 45.86, then California with an index of 43.79, and New York with an index of 40.92. New Mexico ranked lowest with an index of 10.02, South Carolina with an index of 12.6. In 1900 Massachusetts ranked first with an index of 49.52, New York second with an index of 46.57. The District of Columbia occupied third place with an index of 44.90, and California with an index of 43.80. North Carolina had the lowest index of 17.51. New Mexico, however, had changed from 48th position to 37th. It should be noted that there was a general, though slight, improvement in the standing of these places except the District of Columbia. In 1910 the State of Washington occupied first rank with an index of 61.21. California was second with an index of 60.44. The District of Columbia was again third with an index of 56.33. Massachusetts came fourth, having an index of 56.32. South Carolina stood lowest with an index of 24.87. The period between 1910 and 1918 brought about rather remarkable changes. In 1910 Montana occupied seventh place; in 1918 it was first with an index of 75.89. California retained second position, having an index of 71.21. Arizona, which in 1910 occupied 18th position, was third with an index of 66.19. New Jersey was fourth with an index of 65.93. The District of Columbia was fifth, State of Washington sixth, Massachusetts ninth, and New York 13th. South Carolina was again lowest in the scale.

Dr. Ayres states, "The figures of the table indicate that the school systems of the Western States have made the greatest progress during the period covered. In all the divisions the most rapid forward movement was made during the decade from 1900 to 1910. In the eight years

from 1910 to 1918 the most noteworthy advance was made by the States of the North Central Division. These States of the Middle West show particularly rapid progress during the last two years of the period.

EXPENDITURES FOR PUBLIC EDUCATION IN ELEMENTARY AND SECONDARY SCHOOLS. The Bureau of Education has made public the following figures showing the cost of public elementary and secondary schools for the 50 years from 1870 to 1920:

THE EXPENDITURES FOR PUBLIC EDUCATION IN ELEMENTARY AND SECONDARY SCHOOLS	
Year	Public elementary and secondary schools
1870	\$68,000,000
1880	78,000,000
1890	141,000,000
1900	215,000,000
1910	426,000,000
1915	605,000,000
1918	762,000,000
1920	1,015,000,000

CONTINUATION SCHOOLS. Several States have within the past few years enacted continuation school laws. The most recent law of this character to go into effect is that of New Jersey, which became effective July 1, 1920. Under the terms of this law every school district in which there are legally employed 20 or more minors between the ages of 14 and 16 is required to establish a continuation school. The purpose of this school is to provide a practical type of education for boys and girls who have left the elementary school and gone to work. The school is expected to carry forward the elementary education that these young people have already received in the lower grades in order to conserve the investment already made in their education.

The State Department of Education of New Jersey urges that wherever possible the continuation school should be separately organized and in the larger cities the school should have its own building and its own corps of teachers. Schools having enrollments of 400 or more require a director and the State supplies one-half of the salary from Federal funds. A teacher quota amounting to \$400 per annum for the full time service of each approved teacher for a period of 36 weeks is also allowed.

A similar law has been in operation in New York State for more than two years. Recently considerable opposition to its enforcement has been manifest. It now seems probable that an attempt will be made to repeal the law.

FEDERAL BOARD FOR VOCATIONAL EDUCATION. *Vocational Education.* The Fourth Annual Report of the Federal Board for Vocational Education shows that Federal aid was received by 3155 schools, of which 1375 were agricultural, 758 were trade or industrial, 600 were home economics, and 322 were part time continuation schools. These schools employed 7675 vocational teachers and enrolled 265,143 vocational pupils, of whom 163,313 were male and 101,830 were female.

Rehabilitation of Disabled Soldiers. The law providing for vocational rehabilitation for disabled ex-service men became effective June 27, 1918. From that date to June 30, 1920, the total expenditures were \$34,719,196.28. Of this amount \$27,475,134.03 had been expended for purposes having direct bearing on the training of men. The items included in these expenditures are: allowances to men in training, \$23,-

653,503.71; tuition, \$2,309,233.26; travel and subsistence of trainees, \$806,407.60; books and training supply, \$486,127.22; medical attention, \$97,757.30; miscellaneous, \$55,161.14; and special fund, \$66,952.75. The Board had spent for items having an indirect bearing on the training of disabled soldiers \$7,244,002.25. The largest item in this amount was for salaries—\$5,598,454.57. Furniture and office equipment had cost \$444,005.86, and printing and stationery, \$349,597.11.

The report states that the number of men voluntarily electing to take training greatly exceeds every estimate made in the earlier period of the work. Up to June 30, 1920, 45,248 men have pursued courses. Of these 6481 were prevocational, 15,559 were trade and industrial, 11,661 were commercial, 5397 were agricultural, and 6151 were professional. Under the direction of the Board training is given for 252 occupations. Of these 128 are for trades or industries, 36 commercial, 24 agricultural, and 64 professional. Among the prevocational courses elementary education with 1567 students is the most popular. In the trade and industrial section mechanics leads with 2051 students. The general commercial courses enrolling 3439 men is the most popular in the commercial section. In the agricultural group general agriculture with 3873 men is the most popular. Among the professional group law with 816 students is the most popular.

Industrial Rehabilitation. The Industrial Rehabilitation Act was approved on June 2, 1920. This law provides for the vocational rehabilitation of persons disabled in industry or otherwise and their return to remunerative occupation. Under the law the Federal Board for Vocational Education is charged with the administration of the act. The Federal government leaves the direction of industrial rehabilitation to State authorities, but it agrees to make substantial financial contributions, provided the money is spent in accordance with the provisions of the Federal Act. The State, in order to take advantage of the appropriations, must through legislative authority accept the provisions of the act. The State is required to outline the methods proposed for carrying on the work and these plans must be approved by the Federal Board, if found to be in harmony with the spirit of the act. "Persons disabled in industry or in any legitimate occupation" are eligible to receive training.

The act provides for an appropriation of \$750,000 for the fiscal year ending June 30, 1921, and for a period of three years following the sum of \$1,000,000 annually. This sum is to be allowed to the States in the proportion which their population bears to the total population of the United States exclusive of the territories. Five thousand dollars is the minimum allowed to any State. The money received from the Federal government must be matched by an equal amount of State or local public funds.

Prior to the enactment of the Federal law 12 States had provided for industrial rehabilitation. Seventeen other States have since accepted the provisions of the Federal Act.

MILITARY TRAINING IN THE HIGH SCHOOLS. Section 40 of the Act of June 3, 1916, authorized the President of the United States "to organize and maintain in civilian institutions a reserve officers' training corps which shall consist of a senior division at universities and college requiring four years of college study for a degree, and

a junior division organized at all other public or private institutions." The primary object of this act is to provide systematic military training in civil educational institutions for the purpose of qualifying selected students as reserve officers in the military forces of the United States. Acting under authority of this law, the War Department approved 90 units in public high schools and 36 in military academies for the year ending June 30, 1920. There was a total of 57,700 high school boys in these various units. Of these 44,852 were in public high schools and 12,955 in military academies. The War Department detailed 67 commissioned and 74 non-commissioned officers for military instruction in these units. The total expenditures for the Junior R. O. T. C. were approximately \$2,500,000. The average cost per student for military training under this plan was approximately equal to the per capita cost for all instruction in high schools.

Under the provisions of the act the War Department supplied uniforms, including overcoats, hats, and shoes to each boy enrolled in the unit. They also supplied military equipment to the school for the use of the unit. In some school systems, as for example Cleveland, all high school boys 14 years of age or over, who are physically fit, are compelled to join the Junior R. O. T. C. In most places, however, membership is optional. Under these conditions, it sometimes happens that as few as 10 per cent of the boys are enrolled.

The efficiency of the Junior R. O. T. C. having been questioned by army officers and others, a civilian committee was appointed to study various units and to offer recommendations to the War Department. This committee reported that in its judgment the results did not justify the large expenditure of money and that furthermore boys of high school age, having only the physical and mental ability of such persons, were not able to absorb training of a character that would be suitable for officer training. The committee called the attention of the War Department to the experience of foreign nations in respect to military training as a part of the school system. Even in the most militaristic countries it has been found inadvisable to require formal military training as a part of the secondary school programme. Before the war there was no military training for boys of 16 or under in Germany. In general, the military and school authorities of foreign countries believe in a type of physical training which is fundamental alike to good citizenship and military requirements.

The committee recommended to the War Department that existing units should be continued under somewhat modified form in order to more thoroughly test out the efficiency of the plan. It was urged, however, that great care be taken in selecting students whose physical and academic achievement gave promise of fitting them as prospective military officers. The committee further recommended that the War Department should discontinue issuing uniforms to the students. Greater care should be exercised in selecting the officers who are to conduct the military training and the War Department should give more attention to establishing standards of achievement and providing advice and assistance in the achievement of those standards.

The National Education Association. During

the past few years the membership of the National Education Association has been so greatly increased that new methods for the conduct of the business of the Association had to be devised. This matter has been under consideration for several years, and at the Salt Lake City Meeting in July, 1920, a reorganization plan was adopted. The chief features of the plan may be summarized as follows:

The National Association is composed of State and local associations. Any State teachers' association may affiliate and thereby become a State unit in the National Association. Any local teachers' organization may affiliate and thereby become a local unit in the National Association. The governing body of the Association is the Representative Assembly, composed of delegates elected by affiliated State and local organizations.

The basis of representation of an affiliated local State association in the Representative Assembly is one delegate for each 100 of its members or major fraction thereof, who are active members of the National Association, up to 500 such members and thereafter one delegate for each 500 members or major fraction thereof.

The basis of representation of an affiliated local association in the Representative Assembly is one delegate for each 100 members or major fraction thereof. Local associations must have, therefore, at least 51 members in order to be entitled to a delegate. All delegates, both State and local, have equal rights and privileges in the Representative Assembly and each has one vote. Affiliated State associations are assessed annual dues of \$10 for each delegate to which such association is entitled in the Representative Assembly, the maximum dues being \$100.

The annual dues of each affiliated local association are five dollars. The National Association continues to enroll individual members and only those who are active members of the National Association are eligible to membership in the affiliated State and local associations.

A PROPOSED FEDERAL DEPARTMENT OF EDUCATION. During the past several years there has been a large amount of discussion in educational circles relative to the establishment of a Federal Department of Education with a Secretary of Education in the President's cabinet. The difficulties that the country has experienced in reference to the supply of teachers has served to emphasize the importance of some constructive measure to meet the situation. There is now before Congress a measure known as the Smith-Towner Bill, the chief provisions of which are the following:

1. Creates a Department of Education with a Secretary in the President's Cabinet.
2. Transfers the Bureau of Education to the Department of Education and provides that other bureaus, divisions, boards, or branches of government which, in the judgment of the President, should be controlled by, or the functions of which should be exercised by, the Department of Education, be transferred to that department.
3. Provides an appropriation of \$500,000,000 in addition to the amount now available for the Bureau of Education for administrative expenses and for research. It is provided that investigations be undertaken in the field of illiteracy, immigrant education, public school education, and especially rural education, physical education, including health education, recreation, and sani-

tation, preparation and supply of competent teachers for public schools, and in such other fields as, in the judgment of the Secretary of Education, may require attention and study.

4. Appropriation of \$100,000,000 for the following purposes: \$7,500,000 for the removal of illiteracy; \$7,500,000 for Americanization; \$20,000,000 for physical education, including health education and sanitation; \$15,000,000 for the preparation of teachers; \$50,000,000 for equalizing educational opportunities throughout the nation.

5. "No money shall be apportioned to any State unless a sum equally as large shall be provided by said State, by local authorities, or by both, for the same purpose," and provided, "that the sum or sums provided by a State for the equalization of educational opportunities, for the promotion of physical education, and for the preparation of teachers shall not be less for any year than the amount provided for the same purpose for the fiscal year next preceding the acceptance of the provisions of this act by said State."

6. In order to receive funds a State must maintain a legal school term of at least 24 weeks, a compulsory school attendance law covering the ages of 7-14 inclusive, and the English language shall be the basic language of instruction in common school branches in all schools, public and private.

7. It is expressly provided that the act "shall not be construed to require uniformity of plans, means, or methods," and provided further "that all educational facilities encouraged by the provisions of the act shall be organized, supervised, and administered exclusively by the legally constituted State and local educational authorities."

In addition to hundreds of Chambers of Commerce, Rotary Clubs, Kiwanis Clubs, Women's Clubs and other local organizations the following national organizations are supporting the bill: National Education Association, American Federation of Labor, American Federation of Teachers, General Federation of Women's Clubs, National Congress of Mothers and Parent Teacher Associations, American Library Association, National Council of Jewish Women, Association of Collegiate Alumnae, Patriotic Order Sons of America, National League of Women Voters, and National Society Daughters of the American Revolution.

TEACHER SCARCITY. The scarcity of teachers, which began to be serious in 1916, continued throughout 1920. The most reliable reports available indicate that more than 100,000 teachers were lacking during this year and that 300,000 children were deprived of proper school privileges. In addition to this a large number of schools were taught by persons who were incompetent to properly fill the positions. Until the past September there continued to be a decreasing number entering the normal schools and preparing to teach. In general, States and localities endeavored to meet the situation by increasing the salaries of teachers. In several States the minimum legal salary for teachers in the public schools is \$800. Almost without exception the cities and various schools districts have been anxious to increase the salaries of their teachers, but in many instances the impossibility of raising larger taxes for this purpose has created a serious problem.

Bills for increasing State appropriations for

teachers' salaries were before nearly every Legislature that met in 1920. In many States important measures were adopted. Indiana, for example, enacted a law providing for increases of about 30 per cent in the salaries of teachers in the common schools. The most important legislative act, however, is found in New York State. In accordance with an act which was signed by Governor Smith on May 11th the sum of \$20,550,000 was raised by a direct State tax of one and one-half mills for the purpose of increasing the salaries of teachers. The law makes definite requirements regarding the minimum salary that must be paid in cities and communities of different sizes and in general stipulates the number and amount of annual increments. In addition, it appropriates amounts varying from \$600 per teacher in New York City to \$250 per teacher in rural schools.

Throughout the country the question of raising sufficient sums to meet the increasing financial demands of the schools is reaching a critical stage. The school system of New York City has a deficit of \$28,000,000. Other municipalities are in almost as desperate a condition.

Excessive cost of building, coupled with the rapid increase of population in many of the cities, has created a serious situation in reference to the housing of schools. For the past three years very little has been done in regard to repairing and improving existing school buildings. Consequently, many of the cities are now facing the question of large bond issues for school buildings. Perhaps there could be no better evidence of the public confidence in the value of schools than has been manifested by the overwhelming majorities that have voted in favor of very large bond issues for school buildings and increased taxes for the support of the schools.

VOCATIONAL REHABILITATION. The Federal government provided for the subsidizing of State vocational rehabilitation to the extent of \$750,000 this year and \$1,000,000 for the next two years among the States in proportion to population on condition that each State appropriate an equal amount. Each State also must accept the Federal vocational rehabilitation act. The Federal Board of Vocational Education has been appropriated \$75,000 annually for four years. This law went into effect June 2, 1920.

Maintenance allowances for disabled soldiers and sailors were increased from \$80 to \$100 for single men and from \$100 to \$120 for men with dependents. This law went into effect June 5, 1920.

STATE LEGISLATION. The Federal act for vocational rehabilitation of industrial cripples was accepted by Alabama, Georgia, Massachusetts, New Jersey, New York, North Carolina, Oregon, and Virginia. A committee was constituted to consider and report on the advisability of extending the work of the industrial accident board to provide industrial training and aid by mechanical appliances for industrial cripples.

NEW YORK. Opportunity for rehabilitation is offered to "any person who, by reason of a physical defect or infirmity, whether congenital or acquired by accident, injury, or disease, is or may be expected to be totally or partially incapacitated for remunerative occupation." The industrial commission and the health department are both taking a part in this work.

OREGON. The industrial accident commission

is authorized to arrange for the rehabilitation of those injured by accident "while working under the protection of the workmen's compensation law." One hundred thousand dollars is appropriated. This law went into effect Jan. 16, 1920.

VIRGINIA. A division for rehabilitation was established under the industrial commission to further the work on vocational rehabilitation.

NORTH CAROLINA. A commission of five was appointed to investigate and report on the advisability of a workmen's compensation act.

EDWARDS, Sir OWEN MORGAN. British historian of Wales, died in Wales in May. He was born Dec. 25, 1858, and studied at universities in Wales, Scotland, and England, where he won medals for literature, philosophy, and history. In 1889 he was appointed lecturer in modern history at Lincoln College, Oxford. He wrote the *History of Wales* which is regarded as a standard authority and he edited the Welsh classics. He published books in the Welsh language and founded and carried on several Welsh magazines including *Cymru* of which he was editor and proprietor till 1907. After that he was chief inspector of education for Wales.

EFFICIENCY OF STATE SCHOOL SYSTEMS. See EDUCATION IN THE UNITED STATES.

EGYPT. Former British protectorate; status of modified independence under consideration in 1920, but not definitely determined; situated in the northeastern part of Africa. Capital, Cairo.

AREA AND POPULATION. The total area of Egypt proper including the region between the Nile and the Red Sea, the Sinaitic peninsula, and the Libyan desert, but not including Sudan, is estimated at about 350,000 square miles. The cultivated area comprising the Nile Valley and delta covers 12,226 square miles. The population according to the census of March, 1917, was 12,750,918, exclusive of nomad Bedouins. Egypt proper comprises the five governorships of Cairo, Alexandria, Damietta, Canal, and Suez. The remainder of Egypt is divided into Lower Egypt and Upper Egypt, which are in turn subdivided into six and eight provinces respectively. The population of Cairo in 1917 was 790,939; Alexandria, 444,617; Port Said, including Iamaila, 91,090; Suez, 30,996. For further details see preceding YEAR BOOKS.

EDUCATION. Elementary instruction is provided in the native elementary schools called *Maktabs*, which in 1919 numbered 3643 with an enrollment of 218,184 pupils. There are besides, higher elementary schools; elementary training colleges for teachers; industrial, agricultural, and commercial schools; and higher primary schools. The total number of schools which were under control of the provincial councils, either directly or through grants-in-aid numbered 3748 with an enrollment of 228,089. The various schools that were directly under the management of the administration of education at the end of 1919 had an attendance of 34,381. The religions according to the census of 1917 were distributed as follows: Mohammedans, 11,658,148; Orthodox, 854,778; other Christians, 155,168; Jews, 59,581; others, 23,243. The Orthodox Christians in the above list are Copts, tracing their descent from the ancient Egyptians and professing the Jacobite faith established in the first century A.D. Their head is the patriarch of Alexandria. They are under three metropolitan bishops and

12 bishops. The centre of Mohammedan culture is the mosque and university of El-Azhar at Cairo, where the Koranic learning is taught. It had in 1914, 405 professors and 9749 students. According to the provisional figures of the census of 1917, the number of illiterates per 1000 was 933.

AGRICULTURE. Egypt's arable area was placed in 1918 at 7,820,801 feddans (one feddan equals 1.038 acres) of which 2,785,033 could be cultivated only after reclamation. In 1918 there were 7843 foreign landowners, owning 687,764 feddans, and 1,729,251 native landowners, owning 4,801,360, making a total ownership of 5,489,124 feddans distributed among 1,737,094 proprietors. The chief product is cotton. See AGRICULTURE. On November 10, 1920, the new cotton crop for Egypt was estimated at 612,000,000 pounds. The other principal crops were as follows (1918 figures): Area and yield of wheat respectively, 1,286,215 acres and 874,720 tons; barley, 336,471 acres and 214,916 tons; corn, 1,811,655 acres and millet 314,196 acres; rice, 385,382 acres.

COMMERCE. The following table shows the import and export totals for the years 1913, 1918, and 1919, and the annual balance of trade (values are given in United States currency, conversions in this and in following tables in this report having been made at the rate of \$4.90 to the Egyptian pound):

Years.	Imports.	Exports.	Trade Balance.
1913	\$139,047,324	\$157,251,311	+\$18,203,987
1918	255,264,976	226,396,400	- 28,868,576
1919	236,574,488	378,682,722	+142,108,234

COMMUNICATIONS. In 1918 the tonnage of vessels passing through the Suez Canal exclusive of vessels requisitioned by the military authorities was 4,839,956 of which 3,228,311 were British and 489,092 were Japanese. The next in the order of importance were French and Italian. Including warships, the total tonnage in 1918 of all kinds was 9,251,601 and the receipts were £3,718,796. The railway mileage exclusive of sidings, March 31, 1919, was 2339, state-owned and operated, and 726 miles owned by private companies. The telegraphs and telephones belonging to the government on that date had a mileage of 6311 and the post offices and stations numbered 2485.

FINANCE. The revenue and expenditure for six years, those for 1919-20 being estimates, are shown in the following table taken from the *Statesman's Year Book* for 1920.

Years	Revenue ££	Expenditure ££
1914-15	15,389,124	16,857,783
1915-16	17,759,418	16,594,666
1916-17	19,927,274	17,240,606
1917-18	23,166,074	22,496,948
1918-19	27,661,289	23,384,326
1919-20	28,850,000	28,850,000

The final account for the year 1918-19 (April 1st to March 31st) and the estimates for 1919-20 are given by the *Statesman's Year Book* for 1920, as follows:

	1918-19 Actual figures ££	1919-20 Estimates ££
Receipts		
Direct taxes:		
Land tax, etc.	5,612,291	5,572,000
Indirect taxes:		
Customs	4,189,168	4,200,000
Tobacco	2,156,523	2,350,000
Excise	580,398	407,000
Miscellaneous taxes	332,716	291,000

Receipts from revenue earning administrations:		
Railways	6,991,105	6,750,000
Telegraphs	237,726	200,000
Post Office	402,831	375,000
Telephones	251,005	200,000
Receipts from administrative services:		
Ports and lighthouses	91,427	170,000
Judicial and registration fees	1,606,939	1,660,000
Miscellaneous revenue	4,464,126	4,585,000
Total ordinary revenue ..	26,916,255	26,760,000
Extraordinary revenue	745,034	540,000
Draft on general reserve		1,550,000
Total	27,661,289	28,850,000

Expenditures	1918-19	1919-20
	Actual figures £E	Estimates £E
Civil list	367,988	413,465
Expenses of administration ..	8,377,380	9,493,957
Expenses of revenue earning administrations:		
Railways	3,685,950	5,374,669
Telegraphs	166,676	144,479
Post Office	366,671	382,257
Telephones	139,512	140,228
Army:		
Egyptian Army	1,753,455	1,442,624
Army of Occupation	146,250	146,250
Pensions	733,095	733,407
Tribute and debt:		
Tribute	664,826	664,826
Expenses of Caisse de la Dette		
Consolidated debt	3,552,266	3,552,266
Non-consolidated debt	344,151	359,180
Sundries		26,373
War gratuities	1,252,458	1,505,000
Extraordinary expenditure in connection with the war ..	517,810	400,000
Settlement of claims arising out of the recent disorders		1,000,000
Total ordinary expenditure	22,062,424	25,807,981
Expenditure for new works ..	1,321,902	3,042,019
Total	23,384,326	28,850,000

The debt and charge on guaranteed loans, privileged debt, and unified debt in April, 1919, were as follows: Debt, £93,388,640; charge, £E3,552,266. The debt was reduced by £177,100 in 1918-19, and the charges on the account of debts of all kinds were estimated in 1919-20 at £E4,605,272.

GOVERNMENT. Soon after the war broke out a British protectorate was proclaimed over Egypt, Dec. 18, 1914, and on the following day Abbas Hilmi was deposed and the title of sultan bestowed upon Hussein Kamil, who died in 1917, and was succeeded by Ahmad Fuad Pasha, who assumed the title of Fuad I (Oct. 9, 1917). The British policy as announced in November, 1919, was to insure the self-government of the country under British protection. Self-government was to be developed so far as possible, but Great Britain was to retain control of foreign affairs and defend the country from interference by any foreign Power. At the same time a constitutional system under British guidance was to be established and the natives were to take an increasing part in the direction of affairs. Pursuant to this policy a mission under Lord Milner was sent to Egypt for the purpose of working out a programme. At the beginning of 1920 the Egyptian ministry was constituted as follows: President of the Council and Minister of Finance, Yusef Wahba Pasha; Minister of Education, Yehia Ibrahim Pasha; Minister of Interior, Mohammed Tewfik Nassim Pasha; Minister of Justice, Ahmed Zulficar Pasha; Minister of Agricul-

ture, Mohammed Shafik Pasha; Minister of Wakfs, Hussein Darwish Pasha; and Minister of Communications, Ahmed Ziwer Pasha. The ministry of communications in the above list was established in 1919 to control the state railways, telegraphs, posts, ports, light-houses, transports, roads, and bridges, etc. The High Commissioner in 1920 was Field-Marshal Viscount Allenby.

The extent to which self-government had been carried out under British rule by the beginning of 1920 is of interest, in view of the Egyptian movement for independence during that year as recounted below. Certain representative institutions were created by the law of May 1, 1883, including a legislative council, a general assembly, and provincial councils, but they were for the most part advisory, and legislative power remained in the hands of the Khedive and his ministers. In July, 1913, new laws substituted for the legislative council and the general assembly, the so-called legislative assembly which was composed of the ministers and of 66 elected members and 17 members named by the government as representative of minority elements of the population. Elections to the assembly were indirect, through the medium of elector-delegates. Members of the assembly were elected for six years, one-third of their number being renewed every two years. The assembly did not possess full legislative power. It could propose laws and its advice was required in respect to measures for loans, tax assessments, and changes in the railway or irrigation systems; but the government was not bound by its decisions. In one respect, the assembly had the complete veto power: Any new direct personal or land tax required its sanction. Upon the provincial councils were bestowed in 1909 the power of applying by-laws and authorizing public markets, and certain other powers pertaining to local affairs. The native courts under the Kadis retain jurisdiction only in matters of personal law and in cases unrelated to religion and concerning the non-Moslem inhabitants. Other matters are adjudicated by native tribunals established in 1883. After 1905 serious offenses were tried at the central tribunal from which an appeal lies to the Court of Appeal.

HISTORY. The mission under Lord Milner sent to Egypt in November, 1919, to report on the causes of unrest and to form a plan of settlement, returned to England after four months. The British government as represented by Earl Curzon, appeared unwilling to grant complete Egyptian liberty on account of the necessity of stable government in Egypt. It appeared not to believe that the Egyptians were capable of maintaining such a government or of protecting their own frontiers and in such a case there would be serious danger to the African and Indian possessions of the Empire. These principles set forth by the foreign secretary in the latter part of 1919 continued to govern British policy toward Egypt during 1920. There was great distrust in Egypt of the Milner mission and strong insistence upon a wider sphere of Egyptian liberty than the British government appeared willing to grant. On May 18th the Wahba Ministry retired and was succeeded by a new ministry under Tewfik Messim Pasha who had been trained in the school of Cromer and Kitchener. In the summer, an Egyptian delegation headed by Zagloul Pasha was in conference in London with Lord Milner;

and in August, a plan was formed which made concessions to the wishes of the Egyptians. But as soon as the compromise was made known in Egypt, it was sharply criticized by the Nationalists, who said it virtually retained the protectorate. In respect to foreign relations, they said it made Egypt a mere satellite of the British Empire; for while Egypt might send and receive ambassadors, it much conform in all respects to British policy; and would have to fight on the side of England in war. Moreover, it stipulated that a British military force would be maintained in Egypt and although the British government disclaimed any intention of occupying the country, the presence of this force would be a menace. The financial terms were also criticized. These provided that the two governments should agree upon a financial council and a judiciary council. This would mean virtual British control of the Egyptian finances and courts. On the other hand, the cost of the army would fall on Great Britain. Another advantage to the Egyptians was that the Department of Education would be left entirely in their hands. In September, popular opinion was consulted in Egypt, with unfavorable results and in November, the negotiations were broken off. The changes in the Milner-Zaghloul compromise demanded by the Egyptians were as follows: Formal abolition of the protectorate; suppression of the financial and judicial tutelage; settlement of the Sudan question in favor of Egypt. While Lord Milner preferred to break off negotiations rather than accept these changes, he said that the door was open to further discussion. At the close of the year, the British government was planning to resume negotiations.

EKENGREN, WILHELM AUGUST F. Swedish minister to the United States, died at Washington, D. C., November 26. He was born in 1861 and graduated at the University of Upsala in 1895. He served in consulates in France, Germany, and New York, and after 1903 was for several years in the Swedish foreign office. He was appointed minister to the United States in March, 1912, after serving here six years as secretary and counsellor of the legation.

ELECTRICAL INDUSTRIES. During the past year the application of electric energy in industry continued on an increasing scale. Many factories formerly operated by steam power were replacing steam boilers and engines with electric motors deriving their energy from electric transmission lines. In the steel industry in particular, electric furnaces of various type were being introduced in many places with highly satisfactory results as to cost and quality of product. Many rolling mills substituted electric motors for steam engines, and the ease of regulation and control afforded by the former machines gave satisfactory evidence of the wisdom of such substitution. The *Electrical World* (Sept. 4, 1920) published a statement of the business being done by the two largest electrical manufacturing companies in the United States. In this article it was stated that during the first six months of the year the General Electric Company had on its books orders totaling \$190,000,000, a figure about 65 per cent of its total sales for the entire year 1919. The Westinghouse Electric and Manufacturing Company had booked orders for the first six months of 1920 at the rate of more than \$80,000,000.

From the same source it was learned that the total number of customers of central station at the beginning of the year was 8,520,400. While there was a widespread effort on the part of central stations and manufacturers of heating appliances to extend the use of these latter devices, the results were quite similar to those reached in 1919. Small appliances which promoted convenience and cleanliness in household work had extensive sales, but in many localities the introduction of electricity for the heating of buildings found rather disappointing response. The heavy initial cost of such devices as well as the large amount of reserve power required in central stations to supply energy for them during the cold season only were cited as among the causes for the slow progress of substituting electricity for direct coal heating of buildings.

In those industries utilizing electric power in connection with chemical processes there was a steady growth noted during the year, and it was confidently expected that a large proportion of the increased power available at the end of the year at the Niagara Falls plants would be rapidly taken up for electro-chemical industries in the neighborhood. (See DYNAMO ELECTRIC MACHINERY.)

ELECTRIC LIGHTING. There was comparatively little progress to record during the year. Lamp manufacturers were turning out incandescent lamps showing high efficiencies and were developing a lamp containing a small amount of argon, which in practice, showed an excellent degree of economy when operated at high candle powers. For searchlights with incandescent lamps to be employed for special purposes such as flood-lighting, the reflectors and other incidental apparatus were improved to a considerable degree. For indoor lighting, illuminating engineers were recommending the use of opalescent bulbs, as glass of this kind, particularly when used with high candle power lamps gave a highly satisfactory distribution of light with an agreeable effect upon the eye. In this connection, also, many analytical studies were made of physical and psychological effects of bright illumination upon persons exposed to such lights for long periods of time. Realizing that factory lighting was not in a generally satisfactory state, studies were continually made to illuminate work shops with more intense lights, and by properly distributing them to avoid the effects of glare that had been inseparable from many of the early installations of electric lighting.

The National Electric Light Association installed in several large cities exhibits of lamps and lighting appliances as object lessons for the purpose of informing the public of the most economical and satisfactory practice in illumination.

ELECTRIC POWER, TRANSMISSION OF. The financial conditions prevailing throughout most of the year prevented the carrying out of any new undertakings in transmitting electric power on a large scale. Many schemes were planned for but only a little work had been undertaken at the close of the year. Certain features, however, were notable, and among these was the preparation by one of the power companies in California to increase the working voltage on a line more than 200 miles in length, from 150,000 volts to 220,000 volts. The intention of this change

was to make it possible to transmit more power, because the existing line was being worked up to almost the limit of its capacity. Some changes in the details of the switching apparatus were to be made, and while the installation of such high voltages presented serious problems, it was confidently expected that these would be readily solved. The practice of inter-connecting separate systems, mentioned in the 1919 YEAR BOOK (see ELECTRIC POWER, TRANSMISSION OF), was continued during 1920. A particular instance of this was the work undertaken by the Southern Power Company, in the construction of a large hydro-electric power plant near Charlotte, N. C. This plant was to be tied in with eight other large stations comprising the Southern Power Company's system.

A plan for the construction of several large central stations and their inter-connection with others already operating was seriously discussed by the leading engineering societies. This was called the Super-Power Zone Plan and was intended to supply electric energy to all the railways between Boston and Washington and extending for a considerable distance back from the coast. A conservative estimate showed that the adoption of electric power by all the railways included in the zone and comprising about 6000 miles of line would save 30,000,000 tons of coal annually. (See RAILWAYS, ELECTRIC.)

ELECTRIC RAILWAYS. See RAILWAYS, ELECTRIC.

ELLIS, ALSTON. University president, died at Athens, Ohio, November 15. He was born in Kenton County, Ohio, in 1847, and graduated at Miami University in 1865. After teaching school and serving as superintendent of public schools in Ohio, he was president of the State Agricultural College in Colorado, 1892-1900, being for most of that period also director of the Colorado Experimental Stations. From July 18, 1901 to the time of his death, he was president of Ohio University. He was an officer in numerous educational and scientific associations and was the author of a history of the ungraded schools of Ohio.

ELLIS, ARTHUR J. American geologist, died, July 22. At the time of his death he was serving as a geologist in the United States Geological Survey. He was born in Kansas, Jan. 6, 1885, and graduated at the University of Illinois in 1908. After service with the Illinois Geological Survey he was appointed to the United States Geological Survey in 1911 and rose to the position of assistant-chief in the ground water division. He wrote reports on the ground waters of Connecticut and San Diego County, Cal., and a widely read treatise on *The History of the Divining Rod*.

ELON COLLEGE. An institution of learning situated at Elon College, N. C., maintained by the Christians, organized in 1889. In the fall of 1920 there were 368 students and 28 members in the faculty, 2 members having been added in the course of the year. The library contained 12,000 volumes. The income was \$237,614. President, William Allen Harper, Litt.D., LL.D.

ELSON, LOUIS CHARLES. American writer on music, died at Boston, Mass., February 14. He was born at Boston, April 17, 1848; studied there and in Germany. After working for a Boston musical paper, he became musical editor of the *Boston Advertiser* and after 1881 he lec-

tured at the New England Conservatory of Music. His first success was *Curiosities of Music* (1883). His other books include *The Great Composers* (1897); *Our National Music* (1889); *History of American Music* (1904); *Musical Dictionary* (1906); *Mistakes and Disputed Points in Music* (1910); *Women in Music* (1918); *Children in Music* (1918). He was editor-in-chief of the *University Encyclopedia of Music* (10 volumes, 1911).

EMERICK, CHARLES FRANKLIN. Educator, died at Northampton, Mass., March 22. He was born near Dayton, Ohio, Nov. 17, 1867, graduated at Wittenberg College, Ohio, in 1889. He taught in the department of economics and sociology at Smith College, Northampton after 1903, and wrote: *Analysis of Agricultural Discontent in the United States*; *Government Loans to Farmers*; *Struggle for Equality in the United States*; *A Neglected Factor in Race Suicide*. . .

ENCEPHALITIS, EPIDEMIC. This disease is commonly spoken of in the lay press as "sleeping sickness," a name already preëmpted by an entirely different condition which is endemic in Africa. Originally characterized as a lethargy it was soon learned that this symptom is by no means constant so that the original term of "lethargic encephalitis" has been replaced simply by epidemic encephalitis, which in turn is not entirely happy, because there are other affections which merit this term, including a complication or type of influenza, a type of infantile paralysis, epidemic meningitis, and even hydrophobia. The disease in question is either new or appears only at considerable intervals. It has recently appeared in nearly every part of the world and has a very high mortality, but fortunately has thus far attacked but a very small per cent of people. It has been known in its present form for about four years and shows no sign of diminution which makes it certain that it is the first world outbreak. It stands in some unknown association with pandemic influenza, but in the pandemic of the latter in 1890, it passed for a phase of that disease with the exception of a peculiar, transitory visitation in Northern Italy in the silk worm district where it was known by the name of "nona" and was compared to a lethargic condition of the silk worm which is said to appear in that creature every eight or nine days ("nona" meaning ninth). It is doubtful whether this disease was the same as that which is now prevalent. When the government commission had reached the spot the disease had vanished. From time to time, as far back as the sixteenth century, affections have appeared in groups or singly which seem identical with the types now under study but the practical problem is the relationship of the epidemic to influenza. There is plenty of evidence that it can precede or follow an outbreak of the latter or occur in its absence yet there are border line cases in which the two affections cannot be distinguished. The literature of the subject is enormous and shows no prospect of subsidence. Not only the medical profession but the public are deeply interested in it and health officers have sent out blanks to the general practitioner so that he may fill in a great variety of detailed information. The mysterious affection strikes down its victims without warning and, as stated before, the death rate is high. Some distinguished men have fallen victims to it.

The most characteristic symptom which can be perceived by others is paralysis of some of the eye muscles, the most noticeable being drooping of the eyelids. Many so-called walking cases in individuals attending to their ordinary duties have been recognized by this one symptom, and many such have been reported. One curious thing to record of the affection is its strong resemblance in some respects to another mysterious malady—botulism, a form of food poisoning from eating spoiled olives, etc. In England the two maladies were at first confounded on a large scale, and in the individual case it is best to make sure that the patient has not eaten of any suspicious article. So great is the variety of symptoms and types of disease in epidemic encephalitis that it is impossible to outline them in a few words. The number of other conditions which it has simulated is large. While no cause has been isolated the infection can be conveyed to animals and the infectious material is contained in the nasal secretions and according to some in the saliva. It is not contagious from man to man as far as known but no risk can be taken. There are no data to suggest that the disease is on the increase or that it will ever menace whole communities.

EMPLOYERS' LIABILITY. See WORKMEN'S COMPENSATION.

ENGINEERING. Engineering in 1920 reflected general conditions and in turn was influenced by them. Readjustments and uncertainties, financial and political conditions the world over, and the time required to get back to normal activities all were advanced as reasons for an uneventful year, with construction far below what was required and what would be considered normal. Comparatively few large projects were put under way or seriously considered, though such possible works as great bridges to connect New York and New Jersey across the Hudson and Philadelphia and New Jersey across the Delaware were presented for discussion while the restoration of the railways to their owners after an experience of government operation with attending deterioration of plant and right of way and failure to make required developments in many cases brought pressing problems. In fact in this last connection it was believed that the engineers of the United States had a most important problem to bring the railways up to the demands of traffic even with the legislation that had been enacted to secure this end. (See RAILWAYS.)

While the engineer of course figured prominently in all the railway councils yet it was on the construction side that he was called upon to function most conspicuously and the construction of new lines and the improvement of existing facilities led to new or rebuilt bridges (q.v.), tunnels (q.v.), locomotives (q.v.), etc., while the problems of electrification (q.v.) in which financial rather than engineering questions were prominent while discussed were not seriously taken up.

Roads and highways (q.v.) received attention due to the increased number of automobiles (q.v.) and the use of motor trucks for freight

transportation. Here again huge construction costs were facing the tax payers in the form of interest charges on bond issues, and there was a call for better, more lasting, and more economical construction. In both rail, water, and motor transportation the matter of terminal facilities became acute during the year and it was realized that much had to be done ranging from proper piers for ocean shipping to municipal markets.

Rapid transit (q.v.) also figured during the year with items on both sides of the ledger. Many interurban or rural trolley lines were abandoned due to inability to meet fixed charges with increased operating costs and a limited fare, and in several cities operation was attended with great difficulty for the same reason. On the other hand subway construction went forward, and such work as the vehicular tunnel between Manhattan Island and New Jersey was started.

In the field of flood protection (q.v.) the work on the Miami Conservancy project advanced and several Western cities were preparing in anticipation of the inevitable damage or danger likely to overtake them at time of flood. In canals (q.v.) there were to be noted the adding of new terminals to the New York Barge Canal and the beginning of work on the Illinois State Waterway, as well as the active discussion of a Great Lakes to the Sea International Waterway involving the deepening or canalization of the St. Lawrence River. Hydro-electric plants of large size, witness the 37,500 horse power turbines at Niagara Falls, and high head reaction turbines on the Pacific Coast with 220,000 volt transmission line, were completed or were well under way, among which should be mentioned the Muscle Shoals project of the United States government.

In mechanical engineering high costs were felt comparatively early in the year and soon led to curtailments especially in manufacturing where financing of earlier years could not be continued. In fact in 1920 construction and manufacturing had to face the conditions resulting from abnormal costs of labor and materials and over-extended credits and more or less general extravagance. During the year conservatism became the order forced by the inevitable reaction and deflation which came about and which were making for a sounder industrial condition. It was inevitable that with high and uncertain prices of materials and uncertain financial possibilities much needed construction work must be forced to wait and this ranged all the way from great projects and public utilities to building. (See ARCHITECTURE AND BUILDING.)

FEDERATED AMERICAN ENGINEERING SOCIETIES. One of the events in American engineering was the establishment of the Federated American Engineering Societies, which was formed to include all the important engineering societies with the single and conspicuous exception of the American Society of Civil Engineers, which decline to participate in the movement. With this Federation was joined the Engineering Council an emergency body organized during the war to mobilize the engineering talent of the country. This last named organization dissolved but the council was adopted as the governing body of the Federated American Engineering Societies and at the first meeting in Washington, D. C., Nov. 18-20, 1920, Herbert Hoover was elected president of the amalgamated organizations. The four vice presidents selected were Calvert Townley, of New

York; William E. Rolfe, of St. Louis; Dean Dexter S. Kimball, of Cornell and J. Parke Channing, of New York. Committees to deal with military affairs, New York State government reorganization, patents, classification and compensation of engineers, types of government contract, and other questions were appointed. Elimination of waste in industry was stated as a principal aim of the new council.

Furthermore the engineering council contemplated setting on foot a campaign of public service, involving coöperation with chambers of commerce, labor organizations, and other bodies in an effort to solve social, industrial, and political problems.

During 1920 the American Association of Engineers increased its membership from 10,000 to 24,000 organized on a basis of local chapters with paid secretaries at important centres. This organization aimed to improve the status of engineers by securing better and equitable compensation especially for those in the lower ranks of the profession, and to encourage or watch legislation having to do with engineering such as propositions to license engineers. The Association was developing on a conservative basis and was far from proving merely a union of draftsmen and other workers as was at first anticipated in some quarters.

The licensing of engineers in the various States continued and there seemed to be a general extension of both the idea and the practice, eleven different States at the close of 1920 having arranged for such licensing. Accordingly some basis of reciprocal relations between the different States seemed to be desirable as well as common codes of practice and some degree of harmony in the different laws and regulations. It was thought likely that the newer and larger engineering organizations as well as the older professional societies and institutes would show increased interest in this field, particularly in the direction of securing uniformity.

ENGINEERING COUNCIL. See MUNICIPAL GOVERNMENT; also ENGINEERING.

ENGLAND. England proper is the largest and most densely populated portion of the United Kingdom. The term as employed in reference to the government is sometimes used for the United Kingdom of Great Britain and Ireland. See GREAT BRITAIN.

ENGLISH. See PHILOLOGY.

ENTRANCE REQUIREMENTS OF COLLEGES AND UNIVERSITIES. See UNIVERSITIES AND COLLEGES.

EPILEPSY. It is estimated that there are 50,000 epileptics in the United States, many of whom are interned in colonies, hospitals, and asylums. The balance are cared for at home or are found among criminals and vagabonds. Of the selected cases treated in colonies about 5 per cent are cured. There has been no notable advance since the institution of colony treatment, but we are learning always more of the intimate nature of the disease. The distinction formerly made between primary or essential and symptomatic epilepsy is becoming fainter. Thus many patients who owe their epilepsy to some lesion of the brain present the so-called epileptic constitution and the lesion only served perhaps to bring out a condition already potentially present. The condition is markedly periodical without much attempt at fixed periodicity. Some subjects have

but few attacks in an entire lifetime and these are often men of unusual mental ability. At the other extreme we see cases which pass from one attack to another until the attacks overlap and cause a fatal outcome. The vast majority are well between these extremes. In about 20 per cent of cases the ancestry is normal and there is absolutely nothing to explain the disease. As a rule however the heredity is bad on one or both sides. Of great significance is the so-called epileptic disposition or temperament, which is often seen in those who never develop the disease. This temperament has been the subject of many essays. The characteristics are antisocial traits, colossal sensitiveness and egotism, selfishness and indifference to the rights of others, total lack of adaptation to surroundings, self assertion, and various other character defects too many for enumeration. Once it was regarded as impossible to make the subject of this disposition aware of his character defects but doubtless a certain per cent can be made to tolerate criticism. The task is a hard one for the victim usually flies into a rage at any attempt to reason with him. As a sort of defense reaction the confirmed epileptic may develop an attitude of humility and hypocrisy with a tendency toward piety which however is merely a subconscious mask and unattended with any true change of character. In other words the lack of self control is so pronounced that no outside aid will serve to correct it and the egotism natural to the subject prevents any attempt at change from within. The chance for the subject to obtain full insight into his condition and to gain in self control is immensely improved by colony life and largely because he is withdrawn from his home circle. Usually he is in a constant antagonism with the family members, neighbors, and others. Association with other epileptics in colonies so far from aggravating his symptoms seems to benefit him. The conditions of colony life are far different from those in hospitals and asylums because of the much greater restraint in the latter and association with a much more hopeless type of epileptic. However, no outside influence seems able to modify the disease or precipitate convulsions. With attacks sufficiently numerous, frequent and severe the mind sooner or later deteriorates and epileptic dementia develops. Even at an early period mental tests show that slight deterioration is in progress. In regard to treatment it has always been sought to diminish the total number of attacks and so ward off dementia; but the only drugs of sufficient value to use in wholesale fashion—bromides—may produce a condition often but little less severe than the disease. The aim of recent years has been to find means to limit the use of these substances. Recently the drug known as luminal has been used to replace bromides. Dr. Van Nuys of the Indiana Village for Epileptics has recently announced that he has used it very freely on 200 of his patients, some over a period of eight months. The dose used was $1\frac{1}{2}$ to 2 grains each evening. He makes no announcement as to his results.

EPIRUS. A district of Southern Albania and Northern Greece with uncertain boundaries (?). The population of the Greek portion consisting of the division of Yanina was given at the Greek provisional census of 1913 at 245,-

618. Northern Epirus has a population of about 250,000 and its chief towns are Argyrocastro with 8000 and Korytza with 40,000, but the figures are uncertain. In November, 1914, Greece secured the consent of the Powers to her occupation of Northern Epirus, and she took possession in March, 1916, but the occupation was not formally recognized by the Powers, and after the autumn of 1916 the Italians held the district with the exception of Korytza and surrounding country, which was occupied by the French. Down to 1920, the status of the region had not been determined.

EPISCOPAL CHURCH. See **PROTESTANT EPISCOPAL CHURCH.**

EPWORTH LEAGUE. See articles on the Methodist denominations.

ERITREA. An Italian colony in Africa, situated on the west coast of the Red Sea, extending from Cape Kasar to Cape Dumeirah with a coast-line of about 670 miles. Area, about 45,000 square miles. The population, which is largely nomadic, was estimated at 380,000 in 1919. Other estimates place it as high as 450,000. Capital, Asmara. In 1920 signs of great commercial development were reported, and the port of Massaua promised to be in the future the chief port for the trade of Northern Abyssinia and the entrepot for a large trade with the Arabian regions in the Red Sea. There is a considerable production of salt, and pearl-fishing is carried on. Livestock include camels, oxen, sheep and goats; and there is a local trade in their products. The imports in 1917 amounted to 47,591,643 lire and the exports 21,660,428 lire. The colony's budget estimates for the year 1919-20 were as follows: Colonial revenue 8,681,000 lire; state contributions, 6,650,000; extraordinary revenue, 8,790,000; total, 24,121,000; expenditure, civil administration, 10,323,384; military, 3,906,000; extraordinary expenditure 9,891,616; total 24,121,000. No later statistics for railways could be given than those in the preceding YEAR BOOK.

ESKIMO. See **ALASKA.**

ERRINGTON, Sir GEORGE. British diplomat, died on March 19. He was born in 1839. He joined the Home Rule movement in 1873 and entered Parliament in 1874. He was best known for the "Errington Mission." After the difficulties arising from the disorders in Ireland when Parnell and hundreds of his supporters had been arrested, Mr. Gladstone, who was then Prime Minister, determined to make an appeal to the Vatican and to this end authorized Mr. Errington to proceed on a mission to Rome, but not as an official representative. Mr. Gladstone later declared that the government did not wish to resume relations with Rome and Mr. Errington was left in an anomalous position. He had acted in good faith throughout, and his services were recognized by bestowing on him a baronetcy. He retired from Parliament in 1885.

ESSAD, PASHA. Former Minister of War in Albania, shot and killed in Paris, June 13. He was the head of a large family known as the Toptani who claimed descent from rulers of central Albania in the fifteenth century. The Sultan of Turkey made him brigadier-general in command of the gendarmes at Jania and during his stay there he was reported to have made a fortune. In 1908 he was in command of the gendarmes at Scutari. When the Young Turk move-

ment had developed he joined it partly in the hope of obtaining liberty for Albania and partly for the purpose of avenging his brother, Gani Bey, who had been murdered at Constantinople. supposedly at the instance of Sultan Abdul Hamid. Essad Pasha was one of the two men who appeared before the Sultan and ordered him to abdicate. After Prince William of Wied assumed the government at Durazzo, March 7, 1914, Essad was made Minister of War and of the Interior. When matters turned against Prince William, Essad was suspected of being in relations with the insurgents. He was bombarded in his house and after his surrender was sent in exile during the pleasure of Prince William. The latter's rule, however, soon came to an end and during the war Essad returned to Albania and was made president of a provisional government, Oct. 5, 1914. This, however, was said to have been brought about simply by his threatening to shoot the entire senate if he were not chosen. Under Essad, the Albanian government sided with the Allies. Essad, however, was obliged to leave the country on account of the protest of the Italian government against his residence there. He went to Saloniki and thence to Paris. The accounts of his career were conflicting and of his personal character even more so.

ESSAYS. See **LITERATURE, ENGLISH AND AMERICAN.**

ESTHONIA. One of the Baltic provinces of the former Russian Empire lying north of Livonia and south of the Gulf of Finland; after February, 1918, a new state comprising besides the former government of Esthonia in Russia, the northern part of Livonia and the north-western part of Pskova. Area, about 23,160 square miles; population about 1,750,000, of whom 95 per cent are Esthonians. As to religion, about five-sixths of the people are Lutherans. Elementary education is compulsory. Dorpat University was re-opened toward the end of 1919 as an Esthonian institution. On Feb. 24, 1918, the government of Esthonia was recognized as a *de facto* government by Great Britain; May 13, 1918, by France; May 29, 1918, by Italy; and subsequently by Japan, Poland, and Sweden. Russia recognized it as a government *de jure*, Dec. 31, 1919. The United States and France refused to recognize its *de jure* independence on the ground that it formed an integral part of the former Russian Empire. On June 4, 1919, a provisional constitution was established by a constituent assembly, consisting of 120 members. According to this, the source of power remained in the constituent assembly, and the executive authority was vested in the president of that assembly, who was assisted by a cabinet of 11 members. The president at the beginning of 1920 was August Rei, and the prime minister was Jann Toenisson. The budget estimates for 1920 were as follows: Revenue, 1,071,000,000 marks; expenditure, 979,450,000 marks.

The Moscow and Esthonian governments formed an armistice Dec. 31, 1919, and arranged a treaty, signed February 2. By this, Russia recognized Esthonia's independence. Other provisions included the formation of a commercial treaty in which Esthonia was to receive the

favorable nation treatment; the immediate establishment of diplomatic and trade relations; the payment by Russia of 15,000,000 rubles in gold; concession for the building of a railway between Revel and Moscow; the granting to Esthonia of control over 27,000,000 acres of Russian forest land; the granting by Esthonia to Russia of freedom of entry of all goods from South Russia at Esthonian ports without tax or duty and of the privilege of using the water power of the Narova River. See RUSSIA and WAR OF THE NATIONS.

ETHNOLOGY. See ANTHROPOLOGY.

EUGENIE, EMPRESS (Marie Eugénie Ignace Augustine). Former Empress of France, wife of Napoleon III, died in Spain, July 11. She had been for a long time in ill health, but her death was unexpected. She was born in Granada, Spain, May 5, 1826, the daughter of a grandee of Spain who afterwards assumed the title and inherited the fortune of the Count de Montijo. The family left Madrid in 1834, at the time of political confusion and settled in Paris, where Eugénie made the acquaintance of many literary celebrities of the time, including Prosper Mérimée and Stendhal. She returned occasionally to Madrid, but after 1847 settled permanently in Paris. There, while moving in the society of the court, she became acquainted with Louis Napoleon, and they were married, Jan. 30, 1853. She was actively interested in public affairs, exerting a considerable influence over the Emperor, especially in matters of foreign policy, and she acted as Regent during his absence in the Italian campaign. To her was attributed in part the Mexican adventure in which Maximilian lost his life. During the Civil War in the United States she sided with the party that hoped for the failure of the North in order that American power might be weakened and France gain a foothold in the new world. There has been much controversy over the question of her responsibility for the war of 1870, and authorities are conflicting, but the words attributed to her by a hostile press, "This is my own war," are not generally taken as authentic. Her enemies believed that she welcomed the war because it would result in making her Regent. After the disaster of Sedan she escaped to Deauville, having obtained a passport by the help of the American dentist, Dr. Evans, and the British ambassador. From there she was taken to England on board an English yacht arriving on September 8. She lived for the next ten years at Chislehurst, in the large Jacobean mansion, Camden Place, where she was joined by Napoleon in March, 1871. After the Emperor's death there, January 3, 1873, she lived in retirement, devoting her attention chiefly to the bringing up of her son, the ill-fated Prince Imperial who was killed in the Zulu War, June 1, 1879. From 1879 to 1900 she was a close friend of Queen Victoria. Her funeral was celebrated in the Abbey church of Farnborough, July 20th.

EUGENE ONIEGIN. See MUSIC, *Opera*.

EVANGELICAL ASSOCIATION. This denomination is composed largely of German-born citizens of the United States, with doctrines similar to those of the Methodist Church. The latest available statistics (1919), show 154,564 communicants, 1697 churches, 1160 ministers, 198,435 pupils in the Sunday Schools, together with 24,358 officers and teachers, besides a Young People's Alliance with 1148 societies and 39,718

members. Reports for 1920 show 527 missions in the United States with 510 missionaries; 163 missions in Europe with 159 missionaries; and 45 missions with 53 missionaries in Asia, making a total number of missions of 735, a decrease of about 50 from the year before. During the year work among the Italians in this country has progressed rapidly. Much relief work has been done among the suffering peoples of Europe. The Association has been taking an active part in the Christianizing of Japan and China. Total receipts for missionary work during 1920 amounted to \$640,817.05 or an average of \$4.02 per member. The principal periodicals are the *Evangelical Herald*, and the *Evangelical Messenger*, published by the Association in Cleveland, Ohio. In addition there are several periodicals printed in German. Hospitals are maintained in Philadelphia, Chicago, and other cities of the Middle West. Educational institutions are as follows: Correspondence College, Reading, Pa.; Evangelical Theological Seminary, Naperville, Ill.; Northwestern College, Naperville, Ill.; Schuylkill Seminary and Evangelical School of Theology, Reading, Pa.; and a preachers' seminary in Germany. The headquarters of the Association is in Cleveland, Ohio.

EVANGELICAL CHURCH, UNITED. Reports for the year ending June 1, 1920, show that there were in this denomination 88,827 members, a slight decrease from last year; 512 itinerant preachers, 188 local preachers, and 941 churches. Sunday schools numbered 929, with 13,470 officers and teachers, and 109,354 scholars. Total pledges to the Forward Campaign amounted to \$875,314. Home missionary work is carried on in 10 fields, principally in the Middle West. Three hundred missionaries are employed in this work, and have 30,883 members in their churches and 52,065 in their Sunday schools. Conversions during the year numbered 2815. Foreign missionary work is carried on in China, and at present there are two missionaries in the Sudan, Africa. A total of \$281,571.58 was received for all missionary work during the year or more than \$50,000 increase over the previous year. The following colleges are maintained by the church: Albright College, Western Union College, the Bible Teachers' Training School (New York City), and the Illinois Training School for Christian Workers. The principal publication is the *Evangelical*, with publishing house at Harrisburg, Pa.

EVANGELICAL SYNOD OF NORTH AMERICA. This denomination stands for the positive and progressive principles of the German Reformation and emphasizes the unity of the Spirit in the bonds of peace among all the Protestant bodies of the country. Founded in 1840, at Gravois Settlement, St. Louis County, Mo., the organization grew rapidly and now extends over 37 states of the Union. The church comprises 19 districts and two mission territories, and is presided over by four general officers. The General Conference meets every four years, the next meeting being in 1921. At the close of 1919 there were 1034 pastors serving 1385 churches and missions; members numbered 335,651; Sunday School members and teachers numbered 144,876. The value of church property was \$20,258,847. A total of \$441,395.30 was raised for benevolences of all kinds. An extensive and successful relief work is being maintained in Germany.

Missionary work is carried on in India and in Honduras. In India six stations are maintained with a total staff of 18 American missionaries, men and women, married and unmarried, and 290 native workers. Educational and evangelistic work has been begun in Honduras at San Pedro, with four American missionaries, two men and two women, in charge. The home mission churches number about 100 served by about 80 mission workers. The church maintains 12 deaconess homes and hospitals, two for epileptics and feeble minded, and eight homes for orphans and old people, valued in the aggregate at \$1,500,000. Eden Theological Seminary is located at St. Louis, and Elmhurst College, at Elmhurst, Ill. Eden Publishing House, the official publication agency, is also in St. Louis.

EVOLUTION. See ZOOLOGY.

EWING, Sir THOMAS. Australian public official, died in New South Wales, September 15. He was born at Pitt Town, New South Wales. From 1885 to 1901 he was member of the Legislative Assembly of the province and during that time served on important commissions relating to public works. He was elected to the first federal House of Representatives in 1901 and remained a member until 1910. Among the public offices that he held may be mentioned those of ministry for Home Affairs and the ministry for Defense in the Deakin Cabinet. He published various works on Australasian subjects.

EXPERIMENT STATIONS. See AGRICULTURAL EXPERIMENT STATIONS.

EXPLORATION. In the past it was the explorer, then the missionary and last the trader. To-day it is often the agent of captains of industry who, seeking raw materials, is the pioneer traveler. So the field of exploration steadily tends to the higher phases of ethnographical research, economic investigation and industrial exploitation, as the areas of unknown lands and seas steadily dwindle. The scientists of the Smithsonian Institution accurately define the objects of exploration as for the purpose of increasing our fund of knowledge regarding the inhabitants, the fauna, the flora and the physical features of the little known regions of the earth. The World War very largely reduced the number of expeditions, confining them almost entirely to regions having definite relations to military operations.

AFRICA. There have been invaded the past year two of the least known regions of this continent, the Atlas range of Morocco, and the Uganda district. It is to be noted that the hitherto extensive and unvisited sections of Morocco and the great Sahara are fast coming under the knowledge of man through French enterprise. The aeroplane is doing marvelous work, and an air base has been established at Colom-Bechar, in the extreme southwest part of Algeria. Thence much unknown region is reached, and two days' journey carries one to Timbuctoo, formerly three months by caravan. During the past year the French topographical mission surveyed several thousand square kilometres of the hitherto inaccessible mountainous areas of northeast Morocco. The mission outlined the limitation of the crest separating the watersheds of the Mouloya and Kert rivers. Captain Augieras, March-May-1920, starting from Beni Abbes, crossed the southwestern Sahara of Morocco. In over 600 miles' travel beyond Tabelbala, over the harmada (tableland), from Iguidi, he met

no one. His researches materially modify the previously charted topography of this region, as also of the Draa plateau. The ethnographical expedition, 1919-20, sent into the Uganda region under the auspices of the Royal Society of London, has returned having been most successful. It was in charge of the Rev. John Roscoe, whose previous extended residence in Uganda fitted him admirably for the work. The field of exploration covered the grass lands between Lake Victoria and the western Rift Valley. Special investigations were made of the life conditions of the Basina, Batusi, Bativas and neighboring tribes. Of special interest was the pigmy Bativa race. Roscoe's preliminary report is of unusual ethnographic interest. It is stated that his most important conclusion is the demonstration of an Asiatic migration of a people of Semitic stock, which through many ages has preserved its original precepts regarding marriage, divorce, chastity, land tenure, etc. Communistic rules obtain as to private property, and fetishism was the religious belief. Among these tribes customs prevail which Egyptologists considered as being extinct thousands of years ago. Some tribes are purely pastoral, rarely eating vegetables and living almost entirely on milk. Besides numerous photographs Roscoe brought back collections of utensils, implements, etc., concerning milk customs, which illustrate the central idea of their life. Further reports are awaited with interest.

ASIA. Although large areas of Asia are scarcely known,—the Gobi desert and the Tibet, Himalayan region, circumstances have prevented their late exploration. However, Mr. Raeburn, London Alpine Club, attempted this autumn, the exploration of the middle slopes of Kinchm junga, the third highest peak of the world. The party hardly passed 20,000 feet on the mountain, which is 28,156 feet high. However, a new pass 18,000 feet was discovered. Misfortune attended the Swedish scientific expedition to Kamtchatka, which was wrecked near Cape Lapotha, in July, 1920, fortunately without loss of life. Dr. R. P. Licent explored extensive areas of the basin of the Yellow River, bringing back much data relative to the provinces of Tche-Li, Chan-Si, Chen-Si, and Honan, as well as from Central Mongolia.

Of the war journeys in Asia the most notable were those of Mr. Philby, Indian Service, which included the crossing of Arabia in 1917 and the visiting of the southern confines of the great desert in eastern Arabia in 1918. The most extended journey was that from Ojair, on the Persian Gulf, to Jidda on the Red Sea. Bordering the Persian Gulf is the great oasis of Hasa, whose principal town, Hufaf, of 30,000 brings at times 100,000 for its great fairs. Philby dissipates the reputed desert horrors of the Dahan, Red Desert, which is but 25 miles wide and is favored by occasional and fruitful rains. The highlands of Najd, the great central desert, were the difficult and desolate parts, with its four mountain ranges, high tablelands, and great wastes of sand and limestone. Its area of over 500,000 square miles, is almost entirely unknown territory. The expedition traveled no less than 140 miles without seeing any one. The journey contributes many data regarding this vast uninhabited region.

EUROPE. Delimitations and boundaries explain the few surveys of illy-known portions of Eu-

rope. M. Boucart surveyed the rarely visited mountainous regions of Albania, his researches being in the Opari and Schar ranges. This journey supplements the Italian surveys, along geological and topographical lines, from Valona to the Curvalesi region.

NORTH AMERICA. The prevailing interest of American scientific explorers of to-day is evident from the unusual activities displayed in researches and investigations relating to the prehistoric races of the United States. In the southwest are numerous ruins, which especially engage the attention of explorers, since they attest the presence in remote ages of a civilization comparable to that of ancient Mexico. During 1920 the Secretary of the Interior, under the law of December, 1896, granted permits for the examination, excavation, etc., of seven ruins in Arizona, six in New Mexico, and six in Utah. These explorations are prosecuted by the Smithsonian Institution, United States National Museum, the Universities of Arizona, Harvard, Nebraska, and Utah, by the Museums of American Natural History, American Indian Research, Carnegie, Milwaukee and Santa Fe, and by the National Geographic Society. Santa Fe is said to have discovered a communal settlement, where a structure 45 stories high and containing 1000 rooms furnished homes for the tribe. The Phillips Academy, Andover, excavated near Santa Fe, a city of four-storied houses, which yielded many burial mounds, and household remains of varied interest, especially in pottery. The National Geographic Society has devoted its activities to a survey of Chaco Canyon, where the immense communal houses of Pueblo Bonito and Chetro Kettle afford remains which indicate a high stage of Pueblo skill in pottery and allied arts.

CANADA. The grave inexpediency of boundary making on paper, without surveys, has been again indicated in the case of Canada and Labrador. Explorations have demonstrated the forestal wealth of the Labrador Peninsula, whence arises the question of jurisdiction. When Newfoundland was set off as a separate province, the letters patent allotted to it the coast of Labrador, which was later defined as including that part of the shore which lay to the east of a line drawn from Blanc Sablon, Straits of Belle Isle, to Cape Chidley. Under strict construction this would transfer to the jurisdiction of the province of Ungava, Canada, a considerable portion of the Labrador coast.

CANADIAN ARCTIC EXPEDITION, 1913-18. Under its leader, Dr. R. M. Anderson, the scientific discoveries of the southern party are gradually appearing. Of the volumes on insects, crustacea, mollusks, annelids, etc., 30 of the 47 memoirs have been published. Among the insects are eight genera, 93 species and five sub-species—new to science.

SOUTH AMERICA. Geographic research and exploration still continue in this continent, where immense areas of unknown regions await the scientist. Colonel Fawcett, who served with the Commission for the demarcation of the Brazil-Bolivian boundary, is now engaged with an official Brazilian expedition in geographic and ethnological exploration of unknown portions of western Brazil. The biological survey of South America, initiated by Chapman in 1911 was continued in 1920 in southern Ecuador by Anthony and Cherric. Through the Para Industrial Com-

pany an expedition is surveying the forestal, agricultural, and mineral resources of the basin of the Amazon. This to promote the traffic of Para.

The most extended and important exploration was that of Dr. A. Hamilton Rice, in the northwest basin of the Amazon and of the upper Orinoco. He ascended the Amazon from Manaoas to the Rio Negros, an affluent of the Amazon 800 miles from the sea. Following up the Negros he crossed to the Orinoco through that remarkable waterway, the Casiquiare Canal, which unites the two rivers. In his efforts to reach the sources of the Orinoco, Rice reached the rapids, named after the Guaharivos, the so-called white Indians. The natives proved to be violently hostile, but though illy armed the expedition fortunately escaped without casualties, but was obliged to retreat. Rice's magnetic, meteorological and physical observations are valuable contributions, and his astronomical work was so complete as to enable him to map the country from Rio Negros to the Guahari Rapids. O. Nordenskiöld is engaged in a scientific expedition to the Gulf of Penas, Patagonia. Marquis de Wavrin is making ethnographical studies of tribes in western Paraguay and southern Bolivia, in untraversed regions.

SMITHSONIAN. Under Dr. Charles D. Walcott, the Smithsonian Institution has continued its field work in the interests of science. Dr. Walcott, in connection with the Upper Cambrian formations, discovered in field-work north of the Canadian Pacific Railroad an unmetamorphosed, undisturbed section, and also fossils to determine the various formations and to correlate them with formations elsewhere. Heller and Haven crossed Africa from Capetown to Egypt, collecting plants and mammals of which 239 mammals and birds were received in one shipment, principally from little known regions. Hoy collected 240 mammals and 228 birds, representing the fast disappearing and remarkable fauna of Australia. Hrdlicka made researches in Japan, Korea, Manchuria, North China, and South Mongolia, relative to the origin of the peoples of eastern Asia and of American Indians. Abbott and Leon collected 10,000 specimens of Hawaiian plants. Hitchcock's botanical work in British Guiana produced over 1200 specimens. The Jamaica plant collections of Maxon and Killip exceed 10,000 in specimens. Dr. Abbott's researches in Santo Domingo had largely increased his collections in fauna and flora, besides archaeological objects from the Samana caves. The Smithsonian field work in the United States covered the Ozark caves, which yielded many prehistoric objects; the mounds of the Cumberland Valley; and the Taos Pueblo ruins; while Fewkes in Mesa Verde Park discovered a cliff house,—the Fire Temple—devoted to fire rites.

MISCELLANEOUS. Extended explorations of New Guinea, the largest island of the world, were made under extraordinary conditions by a German officer, Captain Dentzner. When the World War began he was engaged in the survey of the Anglo-German boundary. Certain of capture if he returned to his base, he cast in his lot with the natives for about five years. His travels resulted in extensive data relating to the ethnology, fauna and flora of hitherto unknown areas. The regions covered were the valleys of the Waria and Watut (a southern tributary of the the Markham), and ranges of Saruvaged and

Finisterre, where peaks exceeding 13,000 feet were found. Carl Lumholtz, known for his explorations of Australia, Mexico, and Borneo, has started on an expedition which plans the crossing of New Guinea through unknown jungles and over snow-capped ranges. Warren and Dyer explored in 1920 the Groote archipelago. Borneo has again been crossed, by B. W. E. Massey, his route being via the Barito, Busang, Kerihau and Kapuas rivers. See POLAR RESEARCH.

EXPOSITIONS. No great world's fair was held during the year, but a bill was introduced in Congress calling for the holding of an international exposition in Philadelphia in 1926 to commemorate the 150th anniversary of the signing of the Declaration of Independence. An appropriation of \$50,000 was proposed to be used by a commission of two representatives from each State to be appointed by the President to make plans for the exposition.

The International Exposition of Industries, held in the Grand Central Palace in New York was continued during the early part of the year, but later, announcement was made that after April 1, 1921, the building would no longer be available for exposition purposes as the owners intend to convert the Palace into an office building.

The British Industries Fair of 1920, the sixth of the series of sample fairs that have been held annually under the auspices of the British Board of Trade since 1912, was held (in the Crystal Palace) in London from February 23 to March 5, and concurrently therewith, there were fairs (in several buildings requisitioned for the purpose, in Birmingham, and (in Kelvin Hall of Industry) in Glasgow. In these exhibitions every article was of British make. The exhibits in London included cutlery, silver, electroplate, and allied trades; glassware of all descriptions, china and earthenware; stationery, etc.; fancy goods; leather used for fancy goods, bookbinding and upholstery trades; brushes; toys and sport goods, scientific instruments, and optical goods. A wide range of the industrial products of the Midlands were represented in Birmingham, while textiles, clothing, hosiery, footwear, chemicals, and foodstuffs were shown in Glasgow.

Similarly three great trade fairs were held in France. The first of these was held in Paris from May 5 to May 24, and surpassed in every way all former efforts. There were about 3500 exhibitions and the visitors were estimated at about 1,000,000 persons. Only products of French origin or manufacture were shown. This fair was held in the Esplanade des Invalides and had the appearance of a miniature city. Two fairs were held in Lyon, one in the Spring and the other in the Autumn. Both were successful and the number of exhibitors increased materially. The Bordeaux fair was held from June 5 to June 20 and catered largely to the colonial demands. These French fairs have reached the proportion of expositions and have proved to be the best means of attracting buyers. Their steady growth has not only created worldwide interest in them, but has added to the importance of international trade. Americans are participating in them more and more, and at the Lyon fair there were about 100 American exhibitors, in striking contrast to the dozen that displayed merchandise at the first one. There has also

been a corresponding increase in the number of American buyers.

The fourth Swiss Sample fair was held in Basel during April 15-29. Permanent buildings were erected at a cost of about \$2,000,000 for this event which in elaborateness of display excelled its predecessors. The products as usual were exclusively of Swiss manufacture. The exhibits numbered about 1200 and the number of buyers was greater this year than in 1919. A first Watch and Jewelry Fair was held in Geneva during July 11-25. There were 173 manufacturers represented and orders amounting to about \$1,400,000 were booked. The visitors numbered 25,000. A Belgian sample exhibit was held in Basel during October 18-November 3.

A first annual Commercial Fair was held in Brussels during April 4-21 at which 1602 exhibitors participated, including five from the United States. There were divisions devoted to food products, metallurgical products, electrical goods, industrial supplies, construction materials, rubber and rubber goods, chemical products, drugs and pharmaceutical products, textiles, ready-made clothing, leather, furniture, and goods for interior decoration, church furnishings, glassware and pottery, jewelry, including watches and gold and silver articles, perfumery, toys, articles of wood, paper, and cardboard, books, and printing materials, photographic supplies, automobile and aviation equipment, and musical instruments. Also there were departments of publicity, agriculture, horticulture, and apiculture, colonial products, decorative and industrial art, economic services, and general and technical instruction. Three separate expositions were held in Antwerp during the Seventh Olympics. These were an International Exhibition of Motor Cars during May 15-June 13. Also an International Exhibition of commercial and agricultural tractors, camions, and motors, from June 26-July 25, and an International Exhibition of sports, side cars, motorcycles, and accessories, from August 7-September 15.

The Fourth Annual Industrial Fair of the Netherlands was held in Utrecht during February and March. It was the first to be held in the permanent buildings especially erected for the purpose. Almost every branch of Dutch industry was represented. The fair had a strictly national character, only products of Dutch manufacture being admitted. A company was organized in the autumn at the Hague for the purpose of sending a "floating fair" as it is called, but practically a ship loaded with sample products and commercial agents to sell them, to various parts of the world, particularly the United States.

The Second Frankfort Industrial Fair was held from May 2 to May 11. Exhibits were included in the following sections: Leather and leather products; jewelry and watches; products of the technical arts and trades; so-called Chinese and Japanese goods; machinery; steam engines and electric motors; metal products; optical goods; moving-picture appliances; photographic apparatus; medical, surgical, and chemical articles; perfumes and soaps; toilet articles; foodstuffs; raw materials and partly finished products. The usual Spring fair was held in Leipzig during March 2-9. An increased number of exhibits was displayed and the attendance was over 100,000 persons. Large orders were taken, but

actual sales were few. The general price scale was considered exorbitant, but this was pursuant to a new fixed policy of the German Government to encourage its exporters to charge world market prices, abandoning the former German commercial policy of underselling. The autumn fair was a disappointment. Musical instruments, amber goods, jewelry, toys, and ivory made up the largest orders. The number of orders received were very small and there were very few American buyers.

A first Spring Fair, was held in Danzig during February 18 to 25. The number of exhibitors announced was about 1100. The number of visitors was large, particularly from Danzig, the surrounding districts, and Poland. In spite of the interest in the fair evidenced by both exhibitors and public, the results were a disappointment, especially in the volume of orders. Many exhibitors were unable to guarantee either prices or date of delivery, and could take orders only subject to liberal terms concerning strikes, transportation difficulties, etc. On the other hand, the exhibitors themselves were keenly disappointed at the absence of buyers from the Scandinavian and other countries possessing a high exchange. A second fair announced for August 15-22, was abandoned although a surplus of 300,000 marks in favor of Danzig was left over from the Spring Fair. It is reported that Cologne is planning to inaugurate a permanent exhibition, known as "Musterschau," mainly for raw material and half-manufactured goods. It is intended that special exhibitions will be held periodically. For the use of the exhibition two large halls of iron construction are already in the course of erection, to which smaller buildings will be added according to requirements.

The first Commercial Fair ever held in Norway was opened at Christiania on September 5, in the presence of the King and Queen. This fair modeled on those held in Leipzig, aroused widespread interest and was considered a great success. About 300 Norwegian manufacturing firms were represented in the exhibition of products. During the week that the fair remained open there were 50,000 visitors, and the number of purchasers buying from the samples shown was between 6000 and 7000 of whom about 300 were from abroad. The Swedish Industries Fair was held in Goteborg during July 5-11.

A first Finnish Industries Fair was held in Helsingfors during June 27-July 6. All branches of Finnish trade and industry were represented. The foreign exhibit also was rather large and varied, although most of the foreign firms exhibited through their local representatives. The import restrictions, however, caused difficulties. Practically no bargains could be concluded and foreign exhibitors were disappointed, although a net profit of about 200,000 marks in real estate and fixtures was reported.

The first Prague, Czechoslovakia, Sample Fair was held during September 12-28 in the Industrial Palace. There were 2100 exhibitors and the visitors numbered over 250,000. The total sales were estimated at 900,000,000 crowns.

The exhibition of British made goods held in the Zappeion Building in Athens, Greece, during Oct. 19-Nov. 23, 1919, was under the control of the Federation of British Industries, organized in 1916 for the development of British trade throughout the world. It represented more

than 16,000 commercial houses with a combined capital of some \$20,000,000,000. The success of the enterprise was not what it was expected, but the importance of Athens as a strategical commercial point is evident and it is believed that in the near future Greece will become a storehouse for supplying neighboring, and even far off, regions.

In Italy, a first Sample Fair was held in Milan during April. It was opened to manufacturers of all countries and the participation of industries lacking in Italy were especially desired. Orders amounting to 1,076,640,133 lire were conditionally offered and the actual business concluded totaled 523,928,810 lire. A second Sample Fair was held in Padua during June 1-15, which was successful. During October an International Sample Fair was held in Trieste, which had for its chief object the development of trade interests in the Orient. The success of the sample fairs held in Milan and in Padua seemed to have been sufficient to stimulate further interest in this plan of developing sales. A later project of this character was that of a floating fair on board the steamship *Trinacria*, which visited the principal cities of the Western Mediterranean in the interests of Italian manufacturers. The length of the stay in each port varied in accordance with its importance, from four to seven days. Provision was made for special exhibits of practically all kinds of goods, whose manufacture in Italy was important, including food products, textiles, machinery, automobiles, glassware, art goods, etc.

The Barcelona, Spain, Sample Fair, after several postponements, was finally held during October 24-31. The exhibits were shown in the Palace of Fine Arts, one of the largest exhibition buildings in Spain.

In South America a number of minor exhibitions were held including the National Live Stock Exposition (July 4-11), in Rio de Janeiro, Brazil, and an exhibition of British products was held in Lima, Peru, in April. Also arrangements were made for an exhibition of American products in Buenos Aires, Argentina, under the auspices of the National Exposition of United States manufacturers during October. A first Pan-American Exhibition of Architecture was held in Montevideo, Uruguay, during March 1-7.

A fair was held during May in Bandoeng, near Batavia, Java, at which foreign manufacturers were invited to exhibit their products. The exhibits included all articles manufactured in the Dutch East Indies, all raw materials and partly manufactured goods needed there, including both domestic and imported goods, and all imported goods required to start new industries or modernize and improve existing industries.

In commemoration of the 100th anniversary of the independence of Peru, an International Industrial Exposition will be held in Lima during July, August, September, and October, 1921. A site in a most desirable location of the city has been set aside by the Government and contracts for the construction of the buildings have been awarded which are to be ready for occupancy in May. Already 10,000 square feet of space have been tentatively taken for exhibits by American manufacturers.

EXTENSION WORK. See AGRICULTURAL EXTENSION WORK.

FABER, EDMOND BECKETT, Lord. British banker, died in September. He was born in

Hertfordshire, and educated at Eton and Cambridge. He joined the banking firm of Beckett and Company of which he became senior partner. He was a member of the Royal Commission on the transfer of land and served in other important financial capacities, and was a member of Parliament from 1901 to 1905. He also had important interests in the newspapers of Yorkshire.

FAILURES. See FINANCIAL REVIEW.

FAIRHOLME, WILLIAM ERNEST. British soldier and diplomat, died, August 7. He was born at Leamington, Feb. 5, 1860, educated at Harrow and Woolwich and entered the royal artillery in 1879. He served in a number of military and boundary expeditions, was in South Africa during the Boer war, and was the British staff officer for the reorganization of the Macedonian gendarmes, 1904-6. In the year before the late war he was brigadier-general in command of the artillery of the third division and after 1914 he was military attaché at Brussels, The Hague, Copenhagen, and Christiania.

FALCONBRIDGE, Sir GLENHOLME. Canadian jurist, died, February 8. After 1900 he was chief justice of the King's Bench in Ontario, and after 1916, president of the high court division of the Supreme Court. He was born, May 12, 1846, and studied at the University of Toronto, graduating with honors. He was lecturer in that university and was admitted to the bar in 1871. In 1885 he was made Queen's Counsel. He served on several important royal commissions.

FAKLAND ISLANDS. A British crown colony consisting of a group of islands in the South Atlantic, comprising East Falkland, with an area of 3000 square miles; West Falkland, with an area of 2300 square miles; and about a hundred small islands with an area of 1200 square miles; making a total of about 6500 square miles. Included under its administration is the vast area described in the succeeding article on **FAKLAND ISLANDS, DEPENDENCIES OF.** The estimated population in 1918, including the whaling station of South Georgia was 3252 with a birth-rate of 25.31 and a death-rate of 3.99 per thousand. The chief town is Stanley, with an estimated population of 950 inhabitants. Education is compulsory; the total number of pupils in 1918 was 319. The principal industry is sheep-farming, but horses and cattle are also raised. The following information was supplied by the United States Bureau of Foreign and Domestic Commerce in 1920: The Falkland Islands are by no means cold and barren rocks devoid of interest and opportunity. On the contrary, the fine, healthful climate and the almost immediate rewards for settlers should render them attractive to hardy and enterprising men and women who are not afraid of work. Swept by westerly winds three days out of every six, the islands are invigorating, but not so cold as the Scottish coasts and islands, which they closely resemble. Ice and snow are infrequent; flowers and plants such as poppies, daisies, veronica, violets, strawberries, and all kinds of vegetables flourish here. The inhabitants of East and West Falkland, and South Georgia (centre of the whaling industry), the South Shetlands, and South Orkneys number about 3000. Practically all are British, with the exception of Norwegians engaged in whaling.

Foreign trade in 1918, was as follows: Exports, £2,054,286; imports, £939,937. Leading

exports were whale products and wool and the leading imports, provisions, timber, coal, wearing apparel and hardware. In 1919 the trade of the United Kingdom was as follows: Exports to the United Kingdom, £1,891,409; imports £487,787. In 1918, the revenue was £46,365 and expenditure £20,270. The islands are under a governor, aided by an executive council and a legislative council. Governor at the beginning of 1920, Sir W. Douglas Young.

FAKLAND ISLAND, DEPENDENCIES OF. The addition of an extensive and important Antarctic colony to the countries of the world, is due to the economic provision of the British government, which recognized the material importance of controlling the animal life of the great southern ocean. In July, 1908, Great Britain, by proclamation, added to its domain, a great no-man's region of the Antarctic zone. As set forth in the proclamation this region is: "Situated in the South Atlantic Ocean to the south of the 50th parallel of south latitude and lying between 20° and 80° west longitude." Officially designated as the Dependencies of the Falkland Islands, this organized domain has an area of land and sea of about 3,000,000 square miles, slightly greater than the area of the United States, 1½ per cent of the surface of the globe. According to official report this area "comprises the only Antarctic or sub-Antarctic regions containing good harbors open all the summer." It includes the following lands and islands: South Georgia, South Shetland Islands, Graham Land and adjacent islands, South Orkney Islands, Coats, Leopold and Caird Lands, and presumably all unknown seas and lands of the above region to the South Pole.

GOVERNMENT. The Dependencies are subject for laws, administration, etc., to the control of the officials of the Falkland Islands, whose governor, by and with the consent of the council, makes laws. The Supreme Court has legal jurisdiction, and appoints such magistrates and other officers as are needed. Excepting the meteorological staff at South Orkneys, the only permanently inhabited land is South Georgia, where a stipendiary magistrate, customs, and police officers are located to supervise the whaling industry, which is carried on throughout the year. A magistrate is sent with each whaling expedition operating elsewhere. The revenues and expenditures are handled by the treasury of the Falkland Islands. In 1917, the last complete year, the revenues were 15,366 pounds sterling, and the local expenditures, 776. The revenue is derived from rents, license fees, and taxation of whale oil.

WHALING INDUSTRY. This whaling ground in recent years has been more productive than all other combined seas of the world. Although many whales can be caught outside of the territorial waters, the catch can be commercially profitable only by the use of harbors. In South Georgia there are eight companies holding fishing licenses for 21 years, but in 1914-15 there were 14 additional companies holding whaling licenses for one year. The catch and produce for the last three available years were: 1915-16, 11,792 whales, 558,805 barrels of oil; 1916-17, 6474 whales, 36,087 oil; 1917-18, 4313 whales, 258,476 oil. The total value of the whale fishery during the three years were, in pounds sterling, respectively: 1,923,247; 1,494,351; and 1,566,000: these were customs values, considerably be-

low market prices. The catch of 1917-18 in other seas of the world produced only 100,000 barrels of oil, less than 40 per cent of the Antarctic catch. It is to be added that the values, in pounds sterling, of the catch of seal, sea-elephants, and sea-leopards were: 2904 animals, 16,000 value; 1917, 3018 animals, 26,485 value; 1918, 6137 animals, 30,685 value. The catch of the humpback whales fell off from 96.8 per cent in 1910-11 to 9.3 per cent in 1916-17, which has caused Great Britain to take up the question of conservation in sea life of these regions. The Secretary of Colonies therefore appointed an Interdepartmental Committee on research and development of the Dependencies. This body of experts thoroughly examined all available knowledge, and pursued their researches along scientific and economic lines relative to both land and sea resources. Their report covered such points as seemed needful to stimulate development and to ensure continued and profitable fishing. They indicated methods necessary for the conversation of seal and whale life in the seas, and to ascertain the mineral resources and their possible exploitation,—especially of coal, copper, and sulphur. Two research ships were recommended, for the purpose of thorough study of whale life, as to birth, maturity, migration, etc.

FARRER, REGINALD. British traveller, botanist, and writer, died in the course of an expedition in the regions between Northern Burma and Tibet, October 16. He was born Feb. 17, 1880, and graduated with honors at Oxford. He traveled in Japan, China, and other countries of the Far East and in Canada in 1903, and thereafter made annual journeys of botanical explorations in the Alps. He visited Ceylon in 1907 and traveled in the Near East in 1912. He journeyed in Northern China, across the Tibetan border, 1914-16, and after his return was employed as clerk in the foreign office. Among his books may be mentioned, Novels: *The House of Shadows, The Sundered Streams, The Waves of Rebellion*. Horticulture and travel: *My Rock Garden, Alpines and Bog-Plants, Among the Hills, The Garden of Asia, On the Eaves of the World*. Drama: *The Dowager of Jerusalem, Vansanta, the Beautiful*.

FAY, EDWIN WHITFIELD. Classical scholar, died Feb. 17. He was born at Minden, La., Jan. 1, 1865; studied at Johns Hopkins and at Leipzig, Germany. He was instructor in Sanskrit and the classics in the University of Michigan, 1890-1. After serving temporarily as professor of Latin at the University of Texas, he was professor of Latin at the Washington and Lee University from 1893 to 1899, when he became professor of Latin at the University of Texas. Besides contributing to the classical journals, various essays on Sanskrit, classical philol-

ogy, and linguistics, he published an edition of *The Mostellaria Plantus* (1902).

FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA.

This council is a federation of 31 constituent denominations, embracing approximately 140,000 local churches and more than 18,000,000 communicants, for the purpose of rendering more effective coöperative service. It was organized in 1908 by the official action of the evangelical denominations and since that time has been building up an organization through which they can speak and work together in matters of common interest and purpose. It is made up of officially appointed representatives of the various constituent bodies. In addition to maintaining national offices in New York, Washington, and Chicago, the Council operates through several permanent commissions, including the following: Commission on Evangelism, Commission on the Church and Social Service, Commission on Christian Education, Commission on Temperance, Commission on International Justice and Goodwill, Commission on Relations with the Orient, Commission on Relations with Religious Bodies in Europe, Commission on Relations with France and Belgium, Commission on Interchurch Federations. The Commission on Evangelism has during the past year promoted united campaigns of evangelism in the more important cities of the country, assisting the churches of the community to organize their own resources for this purpose. The Commission on the Church and Social Service has done special work in studying the relation of the Church to present industrial unrest, having established a Department of Research and Survey for the purpose of enabling the churches to function more effectively in this field. It also does important work in helping to relate the churches to organizations for community and national service. The Commission on Temperance continues to carry on an educational programme, coöperating with sixteen other prohibition movements. The Commission on Relations with the Orient is making important investigations and studies in the interest of furthering better understanding between the United States and China and Japan. The Commission on Relations with France and Belgium is coördinating the relief and reconstruction work of several of the denominations in areas devastated by the war. The Commission on Relations with Religious Bodies in Europe affords to the Protestant churches of this country contacts with church movements in European countries. The Commission on Interchurch Federations has assisted in the formation of more than 40 local federations of churches for more effective community service.

During the war a special body created by the Council, known as the General War-Time Commission of the Churches, rendered conspicuous service in coördinating the war work of the various Protestant denominations. When it was discontinued in 1919 it appointed a committee on the war and the religious outlook, made up of a few representative leaders from each of the larger Protestant churches, to study the present state of religion as revealed or affected by the war. This Committee has issued several publications, including reports on "Religion Among American Men; as Revealed by a Study of Conditions in the Army," "The Missionary Outlook in the Light of the War," "The Church

and Industrial Reconstruction," and "Christian Unity; Its Principles and Possibilities."

The Department of Religious Publicity issues a monthly paper known as the *Federal Council Bulletin*, and furnishes general religious news to the secular and the religious press. The central office of the Council is at 105 East 22nd St., New York City. Its present officers are: Robert E. Speer, President; Rivington D. Lord, Recording Secretary; Alfred R. Kimball, Treasurer; Charles S. Macfarland, General Secretary.

FEDERAL TERRITORY. A territory under the Commonwealth of Australia, situated within the state of New South Wales; area, about 940 square miles; population estimated in 1919 at about 2573. It was acquired by the Commonwealth in 1910 from New South Wales, for the new federal capital, which was to be situated at Yass Canberra. The capital was founded in 1913, under the name of Canberra.

FEDERATED AMERICAN ENGINEERING SOCIETIES. See **ENGINEERING**.

FEDERATED MALAY STATES. The states comprising a large part of the Malay peninsula, namely Perak, 7800 square miles, population (1911), 494,057, capital, Taiping; Selangor, 3156 square miles; population, 294,035; capital, Kuala Lumpur (the largest city, with a population of about 60,000); Negri Sembilan, 2550 square miles; population, 130,199; capital, Seremban; Pahang, 14,000 square miles; population, 118,708; capital, Kuala Lipis; making a total of 27,506 square miles with a population in 1911 of 1,036,999, of whom 420,840 were Malays, 433,244 Chinese, and 172,465 natives of India. The estimated population in 1918 was about 1,280,000. The total number of immigrants that arrived from southern India was 65,291 in 1918, as against 90,077 in 1917, showing a decrease of 24,786. Of these, 55,583 were classed as laborers and the remainder as traders, etc. The number of laborers of all races employed upon estates on Dec. 31, 1918, was 201,964. The total number of laborers and the number of Indians, respectively, reported to be employed on the estates of the Federated Malay States at the end of each of four years, 1915 to 1918, were:

Years	Total laborers	Indian laborers
1915	170,741	126,347
1916	196,123	138,295
1917	220,758	148,834
1918	201,964	139,480

The number of Indians employed decreased by 9354 in the course of 1918, while the number of Chinese decreased by 12,138. In 1918 there were a number of British schools assisted or maintained by the government with an average enrollment of 6045 boys and 1577 girls, and an average attendance of 5620 and 1457 respectively. The total number of schools in 1918 was 520, with 31,502 pupils enrolled.

The revenue of the states in 1918 was £7,895,700, and the expenditure £5,283,473. The balance to the credit of the Federated Malay States on Dec. 31, 1918, was \$61,566,380. The leading items of revenue in 1918 in the order of their importance were as follows: Customs, licenses, railways, interest, land, revenue, and fees of court or office; and of expenditures, railways, miscellaneous services, including war contribution, personal salaries, and public works. Public debt in 1918, £1,750,000. The chief products are cocoanuts, rice, rubber, tapioca, pepper, sugar,

gambier, nipa palms; and the chief industrial enterprises are the cultivation of rubber and tin-mining. In 1918, 914,980 tons of timber of all kinds were taken from the forests and the gross revenue of the Forest Department was £120,998. There is considerable mineral wealth, including gold, tin, lead, copper, iron, mercury, arsenic, manganese, and a variety of others. The revenue from the mining industries in 1918 was £7,928,917. The country has owed its development chiefly to the rubber trade. The following statistics of the foreign trade are supplied by the United States Bureau of Commerce:

Generally speaking, 1919 was a year of great prosperity for the Federated Malay States, exports from the colony greatly exceeding imports in value, although imports showed a substantial increase. The ratio of advance in value of imports and exports was, respectively, 37 and 25½ per cent. Total values, excluding bullion, were: Exports, \$139,567,552; imports, \$59,427,482; excess of exports, \$80,140,070. The following table, showing the excess of exports over imports since 1912, is of interest for comparative purposes:

1912	\$40,500,000	1916	\$75,000,000
1913	32,000,000	1917	99,000,000
1914	25,000,000	1918	74,500,000
1915	50,500,000	1919	80,140,070

Imports of live animals, food, drink, and narcotics into the Federated Malay States were valued at \$36,129,183 in 1919 and at \$21,867,273 in 1918. Corresponding figures for 1915 were some \$17,500,000 less than the 1919 returns. Exports under the same classification were valued at \$521,742 in 1919, compared with \$849,661 in 1918 and \$991,530 in 1915. Imports of raw materials were returned as \$5,552,638 in 1919 and \$3,810,442 in 1918. Similar exports aggregated \$135,520,837 in 1919 against \$107,440,707 in 1918. Textile materials, which are included in raw materials, imported in 1919 were worth \$26,087, and exports under that heading during the same year amounted to \$1073. Metal imports totaled \$222,113 in 1919, \$330,646 in 1918; metal exports during these two years were valued at \$37,780,681 and \$47,508,736, respectively. The other trade items under raw materials consisted principally of rubber and copra. Manufactured articles imported in 1919 were valued at \$17,722,697, compared with \$11,612,440 in 1918; exports under the same heading were valued at \$21,909 in 1919, compared with \$20,828 the previous year. The balance of the foreign trade returns is made up of miscellaneous articles. High Commissioner in 1920, Sir Lawrence Nunns Guillemard.

FEDERATION OF LABOR, AMERICAN. See **LABOR, AMERICAN** **FEDERATION OF**.

FENCING. The New York Athletic Club won the national team fencing championship, being victorious in 12 bouts out of 15. The Fencers' Club of New York finished second, winning seven bouts and losing 11. The Washington Army Fencers' Club won five bouts and lost 10.

Sherman Hall of the New York A. C. won the individual foils and sabre championships and Ray S. Dutcher, also of the N. Y. A. C., captured the epee title. The national junior epee championship went to Millard J. Bloomer, Jr., while W. T. Gotschall carried off the laurels with the sabre. The national women's foil championship resulted in a tie between Miss Adeline

Gehrig, Miss Alice Glienke, and Mrs. C. H. Voorhees, each winning four bouts and losing one. The U. S. Naval Academy won the inter-collegiate championship, the individual titles being distributed as follows: Foils, J. F. Leicester, Yale; sabre, E. G. Fullenwider, U. S. Naval Academy; epee, C. M. Deland, Yale.

FERTILIZERS. A characteristic feature of the general fertilizer situation during the year in the United States was the continued prevalence of high prices of mixed fertilizers despite a decided break in the prices of raw materials. The situation was such as to lead the United States Department of Agriculture, acting under authority of the Lever Food Control Act, to issue Dec. 10, 1920, a statement to the effect that the prices quoted by fertilizer manufacturers for fertilizers for the spring of 1921, were too high and should be materially reduced, and warning the manufacturers that otherwise "it will be necessary for the individual farmer who uses fertilizers to exercise unusual care in shaping his operations so as to avoid undue risk of financial loss in his efforts to maintain normal production of essential crops." It was further pointed out in this statement that "the consuming public is vitally concerned in this matter for the reason that the maintenance of high prices for fertilizers at a time when the prices of farm products have greatly declined may result in a curtailment of the use of fertilizers and a reduction in acreage and in yield per acre of crops planted."

World statistics of fertilizer production, consumption, and trade during 1919 are very incomplete and unreliable. It is estimated that the annual consumption in the United States is about 7,000,000 tons. The consumption in other countries can not be given, but with the return of peace there has been a world-wide and increasing demand for fertilizers, particularly from European countries, as well as from Japan, Australia, and South Africa, and notwithstanding the large total consumption of fertilizers in the United States, the amount used per acre of cultivated land is much smaller there than in many other countries. The use of fertilizers might be profitably extended in the United States, especially in view of the urgent necessity for greater farm production per unit of labor.

Profiting by the lessons of the war, the leading nations of the world are seriously planning ways and means of making themselves as far as possible self-sustaining as regards fertilizers. Consequently there was great activity during the year in developing the mining of phosphates, especially in North Africa, and restoring and developing that of potash in Germany and France, and in the manufacture of synthetic nitrogen compounds in various European countries. Much attention was also given, especially in England, to salvaging and utilizing the munitions plants and products acquired during the war for fertilizer purposes.

As regards phosphates and potash, the world's potential supply of raw materials is abundant and practically inexhaustible, and potash should soon be available at moderate prices. The nitrogen supply is more uncertain and precarious. The supply of Chilean nitrate is still large, but cannot be indefinitely depended upon. Besides, it is remote from the great centres of use. The practicability of manufacturing nitrogen compounds from the air has been fully demonstrated,

but commercial production is still comparatively small. The leading countries of the world, however, recognize the necessity for nitrogen independence in peace as well as in war. Germany had established such independence before the war. The Scandinavian countries have also been large producers of synthetic nitrogen for some years. Now England, France, and Italy are perfecting plans to make themselves secure in this respect.

The plants constructed by the United States during the war for the manufacture of nitrogen compounds remain incomplete and idle. The completion and operation of the plant at Muscle Shoals, Alabama, for the manufacture of nitrogen compounds for use as fertilizer were under discussion in Congress at the close of the year. This enterprise has been opposed by fertilizer manufacturers as "an unwarranted invasion by the Government in a field of private endeavor." It would seem, however, that with the practicable recovery of ammonium sulphate from by-products, coke ovens and gas works wholly inadequate for our fertilizer needs, with organic sources of nitrogen like tankage and cottonseed meal finding more profitable use than as fertilizer, and the Chilean supply of nitrate of soda remote and at best precarious, the world will be forced to look to nitrogen fixation as the only assurance of adequate supplies of nitrogen compounds, and that in such a vital matter this country cannot afford to fall behind the rest of the world whether this great end is attained through government or private agencies.

The Department of Agriculture is coöperating with the War Department in developing and improving the Haber process of nitrogen fixation, supplementing this work with an effort to devise practical means of making more concentrated fertilizers containing not only nitrogen, but also phosphoric acid and potash, than are now generally manufactured. This is in line with the general movement, which has received considerable impetus in recent years, to increase the use of high-grade concentrated fertilizers.

The Department of Agriculture announced during the year that the Bureau of Soils had developed to a high degree of efficiency a process for reducing low-grade phosphates, briquetted with sand and coke, in an oil-burning furnace, securing in this way a high rate of recovery of phosphoric acid and permitting the production of soluble phosphates for fertilizer purposes at a cost comparing favorably with that of the manufacture of superphosphate by treatment of raw phosphates with sulphuric acid. Distinct advantages claimed for the process are that it utilizes "mine run" material and thus eliminates the enormous waste of phosphate and the costly plants involved in the acid process, and gives a much more concentrated product, thus reducing the cost of transportation and handling. Tests of the process have been made on a semi-commercial scale, and it is believed have gone far enough to give a rough approximation of what may be expected of the process although the final proof of its commercial practicability still remains to be made.

An abundant supply of potash and low prices seem to wait on adjustment of trade relations and conditions. Germany is anxious to make its abundant supply available to the world; France is rehabilitating and developing the large and rich Alsatian deposits; the dry lakes of the

United States are yielding no inconsiderable supply; some potash is being collected from the dust and fumes of cement works and blast furnaces; and material progress has been made toward the solution of the problem of the profitable manufacture of potash from the Pacific coast kelps. Composting with manure and sulphur has been shown to increase the availability of the potash in greensand, and at least one plant is reported to be engaged in an attempt to manufacture potash salts from this material.

The injury to crops by potash fertilizers containing unusual percentage of borax has resulted in much careful investigation as to the limits of safety in the use of such fertilizers. It has been found that the injury varies not only with the amount of borax present, but also with the method of application, kind of soil, character of the season, and the crop grown. Extensive experiments by the Bureau of Plant Industry of the United States Department of Agriculture indicate that "corn and beans are especially sensitive to borax and begin to show reactions from two to five pounds of borax per acre, according to conditions, while potatoes and cotton show reactions from five to 20 pounds. When broadcasted, larger amounts are required to show injury than when drilled, and copious rainfall after application of the borax fertilizers in all cases decreases greatly the injury due to borax."

A number of practical applications of the well established fact that increasing the carbon dioxide content of air surrounding plants in many cases materially stimulates their growth was reported during the year. Particularly striking results on a rather extensive scale were obtained at Essen, Germany, by using for this purpose blast furnace gases freed from poisonous substances. This work suggests a possibility and means of increasing agricultural production in industrial centres.

FICTION. See LITERATURE, ENGLISH AND AMERICAN.

FIJI ISLANDS. A group of about 250 islands in the Southern Pacific, constituting a British crown colony. About 80 of the islands are inhabited and the largest of them is Viti Levu, with an area of 4053 square miles, and another large island is Vanua Levu (2130). Total area, including the island of Rotuma (a dependency since 1880), 7083 square miles—according to other authorities, 7435 square miles. The population in 1911 was 139,541; estimated Jan. 1, 1919, 165,991, of whom 9103 were Fijians and 61,153 were Indians. The Europeans in 1916 numbered 4552. The chief crops are sugar, coconuts, rice, copra, pineapples, and other fruits. The total trade for 1918 was £2,822,433 of which imports were £1,166,367 and exports £1,656,066. British possessions received 72.74 per cent of the total trade and the United Kingdom 4.28 per cent. There was an increase of trade with foreign countries, especially with the United States, which was the only market that received copra exports in 1918. Revenue for 1919, \$2,019,597, as compared with \$1,543,600 for 1918; expenditures for 1919, \$2,142,389, as compared with \$1,580,435 for 1918. Steamship lines connect the islands with Australia, New Zealand, Tonga, Samoa, Honolulu, and Canada. Total tonnage of merchant shipping entered and cleared (1918), 658,813, of which 607,067 were British. It is under a governor appointed by the Crown and aided by an executive council.

Governor and high commissioner for the Western Pacific in 1920, Sir Cecil Hunter Rodwell.

FILTRATION. See WATER WORKS AND WATER PURIFICATION.

FINANCIAL REVIEW. GENERAL CONDITIONS. Following another year of inflation, a period of general reaction in the business world was realized in 1920. Although the change in the industrial situation really began some months earlier, as rising labor and material costs began to burden industry, it did not become general before spring, when production seems to have passed its peak. In this country the situation was possibly rendered more acute by transportation difficulties early in the year, which prevented movement of goods to market in time to meet demand at the best prices. Meanwhile, in protest against high retail prices, particularly of clothing, the so-called "buyers' strike" began to develop. Serious economic disturbances, however, came first in other quarters, ushered in by the collapse of the Japanese silk market. (See JAPAN). Subsequently, trouble developed in the sugar and coffee markets, in which there had been a gigantic speculation for the rise. The producing countries suffered, and Cuba (q.v.) resorted to a moratorium in October. Meanwhile, prices of leather, cotton, and wool were sagging, and depression developed in those industries. After the mid-year, which may fairly be regarded as the turning point, price declines became more general and more extensive in the wholesale markets. Unfilled orders of the United States Steel Corporation declined steadily. The field of depression widened, unemployment developed, and wage reductions were announced in many lines. The Bureau of Labor Statistics index of wholesale prices declined regularly from the high point of 272 (as compared with 1913) reached in May, to 189 in December. However, the decline in retail prices was much less rapid, and the consumers' demand remained inadequate to revive industry. Although the money value of merchandise exports was well maintained throughout the year, both business conditions and the exchange situation in Europe militated against efforts to obtain further relief through export of the accumulating surplus. Imports of foreign merchandise declined steadily in the second half-year, reflecting both the stagnant condition of industry abroad and the declining buying power of this country.

Farm crops were above the average in quantity; the total yield of corn was never greater, the cotton crop was the largest since 1914, and the wheat crop has seldom been surpassed. Prices, however, were much below levels expected when the crops were being made. Corn and cotton in October were scarcely half their May prices, and the price of wheat had then lost more than a quarter, despite a concerted effort to withhold the crop from the market. Under these conditions the farming interests appealed to the government for relief, and succeeded in having a bill passed by Congress to revive the War Finance Corporation—which found no business it could do. A protective tariff on farm products and special consideration from the Federal Reserve Board and banks were also demanded, but without immediate avail. See AGRICULTURE.

BANKS AND BANKING. The development of the year afforded a test of the power of Federal Reserve banks to control and regulate credit. As the special influences affecting discount policy

during the war period gave way to more purely banking considerations, rates were advanced during the first half-year until the general level approximated 6 per cent on war paper and bankers' acceptances and 7 per cent on commercial paper. Under an amendment to the Reserve Act passed April 13, four banks initiated progressive discount rates with a view to equalizing opportunities for the use of their discount facilities. Perhaps because of the exemption of war paper from the progressive rates, their use did not prove to be particularly effective. Rising discount rates no doubt somewhat restricted the tendency toward further expansion, but did not prevent a continued upward trend of holdings of discounted paper by reserve banks. Holdings aggregated \$2,231,000,000 on January 2 and then declined to the year's low of \$2,080,000,000 on January 9. Thereafter holdings increased in a series of upward and downward swings to the high level of \$2,827,000,000 on November 5, and stood at \$2,719,000,000 on December 30. Meanwhile the proportion of war paper declined quite regularly from 66.5 per cent to 42 per cent under the influence of higher rates of discount and of interest on government certificates of indebtedness, which helped to give them lodgment in the hands of investors. Acceptances purchased declined almost constantly from \$575,000,000 on January 2 to \$256,000,000 on December 30, chiefly owing to the increased demand by saving banks and other investors. Total earning assets were \$3,182,000,000 on January 2; \$2,984,000,000 a week later; \$3,422,000,000 on October 15; and \$3,263,000,000 at the end of the year.

Gold holdings declined from \$2,063,000,000 on January 2 to \$1,935,000,000 on March 26 and then rose to \$2,059,000,000 on December 30. These movements were chiefly connected with gold imports and exports. Total cash reserves fell off from the opening figure of \$2,121,000,000 to \$2,035,000,000 on February 20 and then increased to their high figure of \$2,249,000,000 at the close of the year, owing chiefly to Treasury deposits of silver. The ratio of total reserves opened at 43.7 per cent, fluctuated between 42.2 per cent and 45.5 per cent and closed at 45.5 per cent. Eight reserve banks temporarily incurred the statutory penalty for reserve deficiencies, the New York bank being the principal offender.

The general reserve situation resulted in an increasing amount of inter-reserve-bank accommodation, whereby surplus resources of some banks were made available to those upon which demands were heavier. These inter-bank re-discounts and purchases aggregated \$3,673,000,000 and were further increased in effect to \$4,404,000,000 as a result of participation by the Cleveland, Chicago, and San Francisco banks in the daily open market purchases of the New York bank. Federal reserve note issues increased during the year from \$2,999,000,000 to \$3,345,000,000. Apparently member banks used the proceeds of their increased borrowings chiefly in the form of notes.

Between the end of 1919 and November 15, 1920, national bank resources decreased \$629,000,000 to \$22,082,000,000. Total deposits declined \$905,000,000 to \$16,962,000,000; demand deposits declined \$226,000,000; and net deposits fell off \$332,000,000. Reserve balances and cash declined from a total of \$1,821,000,000 to \$1,666,000,000, while total borrowings (chiefly at Federal Reserve banks) increased \$479,000,000 to

\$2,391,000,000. Loans and discounts (including re-discounts) increased \$525,000,000 to \$12,312,000,000.

The best evidence available of current banking movements was that afforded by the weekly returns to the Federal Reserve Board of some 800 national and State member banks in leading cities. War loans and war paper held by these banks declined from \$3,027,000,000 to \$2,033,000,000 during the year. Loans on other stock and bond collateral declined from \$3,391,000,000 to \$2,998,000,000 in August and then rose to \$3,176,000,000. All other loans and investments, which represented largely commercial loans, gradually increased from about \$10,000,000,000 to a maximum of \$11,774,000,000 on October 8, and then declined to \$11,274,000,000 at the end of the year. This was the clearest evidence we had of banking liquidation. However, the proportion of total loans and investments financed by borrowings at reserve banks increased during the year from 11.2 per cent to 12.5 per cent. Net demand deposits (other than government) declined \$657,000,000 during the year to a total of \$10,942,000,000, largely as a result of withdrawals by country bank correspondents.

During the year another State foreign banking corporation submitted its operations to the regulation of the Federal Reserve Board, making a total of ten such corporations having capital and surplus aggregating \$52,875,000 and total resources (at the head offices) of \$313,486,000. Two Edge Act corporations were formed under Federal law with a total capital of \$9,100,000, and another \$100,000,000 corporation was in process of formation at the close of the year. The membership of the Federal reserve system was increased by the admission of 306 state banks. On June 30, 1920, the system contained 77.5 per cent of all eligible banks in the country, and its members held 70 per cent of all banking resources of the United States in other than mutual savings and private banks.

MONEY RATES. On the New York market were generally rising through the first six months of the year and thereafter maintained high levels, softening a little toward the close. Rates on commercial loans in the main followed the lead of the Federal Reserve banks. Ninety day acceptances ranged from 5 per cent to 6½ per cent, while prime commercial paper rose from 6 per cent to 8 per cent during the first half year and thereafter held at the higher figure. Call money rates showed wide fluctuations on relatively high levels throughout most of the year. Only in the last week of November did the rate touch the low point of 5 per cent. The year closed at 7 per cent, but rates from 14 per cent to 25 per cent were recorded in each month down to July, and thereafter 10 per cent was reached in each month except December. Time collateral money ranged from 7½ per cent to 10 per cent, and during a considerable part of the year was practically unobtainable.

BANK CLEARINGS. Clearing house transactions in 199 cities during the year ending September 30, 1920, were \$463,000,000,000, or nearly 20 per cent greater than those recorded for the previous year. In New York City clearings were \$252,000,000,000; in Chicago \$33,000,000,000; in Philadelphia \$25,000,000,000; in Boston \$20,000,000,000; and in Kansas City \$12,000,000,000. Debits to individual account as reported by 150 clearing houses showed total debits of \$482,000,-

000,000 in the calendar year 1920 as compared with \$455,000,000 in 1919. Monthly figures showed a large increase of debits over those of 1919 during the first four months; while in the second half-year appreciable reductions in the amount of debits occurred in each month.

STOCKS AND BONDS. Shares sold on the New York Stock Exchange numbered 223,080,000 as against 316,202,000 in 1919. Sales of about 29,000,000 shares were recorded in March and again in April, but the volume declined to 9,000,000 shares in June, rising again to 22,000,000 in November and December. There were 83 million share days, a figure exceeded only in 1905, 1906, and 1919, and there was one two million share day. Bond sales on the exchange aggregated \$3,913,000,000, or \$110,000,000 more than in 1919. Monthly sales exceeded those of 1919 in all but four months, and reached a maximum of \$512,000,000 in December, when losses were being registered for income tax purposes. The record high price of seats was reached at \$115,000, but there were sales as low as \$77,500.

The year was one of liquidation in stocks although the decline of prices was kept within moderate limits until after the mid-year. Money stringency, with high rates for call loans and scarcity of time money, was the immediate factor in fluctuations, but the industrial situation was in fundamental control of the market. The Transportation Act and the return of the railroads to their owners furnished the occasion for a March rise in the average price of twenty-five railroad stocks to 60.19. In the late summer freight rate advances served a like purpose, but the general business outlook brought about reaction to December's closing price of 54. The average price of 25 industrials showed an early spring advance, but has since receded almost one-third to 91, thus giving evidence of relative greater weakness than rails. The average price of 40 bonds receded until July and then rose to the year's maximum in October, and closed the year at 68½, about three points under the opening.

Issues of new domestic corporate securities in 1920 aggregated \$3,107,000,000, of which \$1,157,000,000 were stocks. Total issues exceeded those of 1919 by \$86,000,000. Of the total, \$416,000,000 were offered by railroads and \$2,691,000,000 by industrial concerns. The amount of new long-term municipal bonds issued was \$653,000,000, while loans of foreign companies and corporations placed here aggregated \$345,000,000. It would thus appear that the grand total of security issues in this country in the year 1920 exceeded \$4,000,000,000.

BUSINESS FAILURES. After four years of diminishing commercial mortality, the number of failures during the year increased by 3,080 to 8,595. This number is lower than that of any of the past 37 years except 1919, while the percentage of failures to the number of firms in business was .44 as compared with the previous year's low record of .29. The number of failures increased month by month from May to December, which showed the largest monthly total since January 1916. Important failures began among export and import concerns, and then appeared in the raw silk trade, followed by the apparel trades generally. Later in the year the shipbuilding and automobile industries were affected, and finally a considerable number of bank suspensions occurred in the northwest. Although

the year's liabilities were \$417,000,000, which was the highest ever shown in *Bradstreet's* record, the percentage of assets to liabilities (64.6) was larger than in any other recorded year except 1907. Moreover, our banking organization again proved its ability to weather a serious business crisis without panic, and therefore to limit the scope of the difficulties. R. G. Dun and Company, showed that 1078 companies in Canada and Newfoundland went into insolvency during the year, as compared with 755 in the previous year. Liabilities of these companies totaled \$26,494,301, or an average of \$24,577, while in 1919 liabilities were \$16,256,259, or an average of \$21,531. The number of failures in 1920 was the third lowest since 1904, but the amount of liabilities was the third highest in that period. The greatest number of failures in 1920, and of the largest companies, took place during the latter part of the year.

FOREIGN EXCHANGE. The foreign exchange market was under the continued influence of unbalanced budgets and heavy import balances in the principal European countries with the result that most currencies touched new low quotations during the year. The revival of European export trade, while relatively great in many instances, was in the aggregate far too slight to correct the downward course of the exchanges under pressure of a large overcharge of bills. The total merchandise export balance of the United States in 1920 was practically \$3,000,000,000, against which are to be offset net imports of gold aggregating \$106,600,000 and new foreign loans floated in this market amounting to nearly \$200,000,000 over and above mere refunding operations. It was estimated late in the year that Europe's unfunded indebtedness to the United States on account of goods purchased amounted to \$3,000,000,000 or \$4,000,000,000. Aside from this direct influence, the tone of the market in continental currencies was progressively injured by the failure of finance ministers to bring their budgets to a balance or even to prevent the increase of floating debt with its attendant inflation. Our export trade has suffered somewhat because falling exchange rates had increased the cost of American goods to foreign purchasers and also because of growing unwillingness of exporters to assume the credit risk involved in selling to many parts of Europe.

From around \$3.80 at the opening of the year sterling cables declined to \$3.50 near the end of January, and then fell precipitately to the year's low record of \$3.19 in the so-called February "exchange panic." A natural reaction followed, strengthened by the official announcement that Great Britain would meet her share of the Anglo-French loan maturing in October without refunding and would if necessary ship gold for that purpose. On this movement sterling rose to \$4.07 early in April, which was the high point of the year. Thereafter rates sagged irregularly but remained relatively high until midsummer. From \$3.55 in August the rate fluctuated considerably, going as low as \$3.34 in November, and closing the year at about \$3.50. In general, the sharp and sudden fluctuations of rates made exchange a difficult market in which to trade.

During the year quotations of continental currencies were generally shifted from the foreign to American monetary units. Converted to this basis the opening quotation of franc cables was

about 9.3 cents, or more than 50 per cent discount from the par of 19.3 cents. During the first quarter the franc followed in general the course of sterling but did not recover so well from the February panic and fell as low as 5.8 cents in April. The market was relatively strong during the early summer and rose to the year's high record of 8.6 near the first of July. Thereafter the decline was fairly steady, influenced no doubt by uncertainty as to the payment of the French share of the Anglo-French loan and by the continuance of unsatisfactory conditions in trade and public finance. The year's closing rate was under 6 cents.

The course of the Italian lira was similar to that of the franc, but its decline was more precipitate. From an opening of 7½ cents it fell to 5 in February, to 3¾ in April, and after recovering to 6¼ cents in July, sagged again to a close of 3¾ cents. Industrial and political disturbances played their part in these movements. German marks opened around 2 cents, fell to 1 cent in February, and under the influence of a strong speculative movement, got above 3 cents in May, only to fall again to a closing of 1½ cents.

Gold movements were particularly heavy between the United States and several foreign countries. From the United Kingdom we imported a net amount of \$275,000,000, from France \$49,000,000, and from Canada \$28,000,000. We sent \$100,000,000 to Japan, \$88,000,000 to the Argentine, and \$28,000,000 to China. The net result was an inward movement of about \$107,000,000. See UNITED STATES, FRANCE, GREAT BRITAIN, GERMANY, and other articles on countries; MONEY, PRICES, NATIONAL BANKS, SAVINGS BANKS, STATE BANKS.

FINLAND. Formerly a Grand Duchy of the Russian Empire; declared an independent republic Dec. 9, 1917, and since recognized by the Powers; situated in the northwest of Europe on the Gulfs of Finland and Bothnia. Capital, Helsingfors.

AREA, POPULATION, ETC. The area was given in 1915 at 125,689 square miles, but a later estimate placed it at 144,249 square miles; population (1915), 3,300,650; estimated 1918, 3,329,546. The urban population in 1918 was 520,827 and the rural, 2,809,319. Males numbered 1,644,964 and females, 1,684,182. The Finnish-speaking in 1915 numbered 2,565,742; Swedish, 344,366. The great majority are Lutherans (3,283,757). In 1917, Helsingfors (with Sveaborg), was reported as having 187,544 inhabitants, but an estimate in 1919 placed it at over 200,000. In 1917 Abo had 56,168; Tammerfors, 46,353; Viborg, 29,753; Vasa, 24,776; Vleaborg, 21,940; Kuopio, 18,106; Björneborg, 17,603. Marriages (1917), 20,004; births, 81,046; deaths, 58,863. The number of emigrants in 1919 was 1085, as compared with 1900 in 1918. Of this number, 538 were men and 547 were women; 253 were from towns (119 men and 134 women) and 832 were from the country (419 men and 413 women); while in 1918 the number of men was 1330 and the number of women 569, the number from towns was 384 (261 men and 123 women), and the number from the country 1516 (1069 men and 447 women). During the period from 1893 to 1918 the total number of emigrants from Finland was 267,755 (166,827 men, 100,955 women, 873 unclassified), most of whom went to the United States. The number of emigrants

from Finland during the war (1914-18) was 20,513. The number of emigrants who returned to Finland from 1909 to 1918 was 13,244, of whom 12,699 settled in the rural districts and 545 in the towns.

EDUCATION. Education is not compulsory, although a measure for making it so was under consideration in 1920. Every parish has at least one folk school or elementary school. There are also many secondary schools, most of which lead up to the University in Helsingfors, as well as many preparatory schools under private auspices and other schools of different kinds. In primary instruction the age is from seven to 15 years.

At the beginning of the 1919-20 school year there were 3639 ordinary rural folk-schools, of which 3172 were Finnish and 456 Swedish. The number of teachers in these schools was 4951, besides special teachers for manual training and girls' handwork. There were also 549 primary folk-schools in rural districts. The city folk-schools had 1351 teachers. The total of folk-school teachers was thus 6302, of whom 5448 were Finnish and 839 Swedish. The number of pupils in rural folk-schools was 173,869 and in city folk-schools 42,026, a total of 215,895. The amount expended by the state for folk-schools in 1919 was 38,390,000 marks (\$2,492,857 at 15.40 marks to the dollar). At the beginning of 1919 there were 55 state secondary schools, of which 37 were Finnish and 18 Swedish. There were also 99 communal and privately owned schools receiving state aid, of which 72 were Finnish and 27 Swedish. The amount expended by the state for secondary schools in 1919 was 16,074,300 marks (\$1,043,786).

The lack of teachers had become in 1920 a matter of grave concern in Finland, as in other countries. This lack was felt during the war, and afterwards increased alarmingly. It became particularly difficult to procure efficient instructors for private schools. The number of students preparing for the teaching profession also seriously decreased. There were only 22 students preparing for teaching during the spring term of 1919, whereas the corresponding number in 1915 was 101. The chief cause for this decrease was undoubtedly the insufficient salaries paid teachers, but a law has recently been passed increasing the salaries in the teaching profession.

The general tendency, especially in the private schools, is to have English instead of French as the second foreign language (German being the first). Russian, which was formerly compulsory in Finland, is now studied very little.

There is one state university, which was founded in Abo in 1640 and removed to Helsingfors after having been burned down in 1827. In 1918 it had 2563 students. There is a technical high school in Helsingfors and private high schools and academies in the larger cities. A Swedish university was opened in Abo in 1919.

PRODUCTION. Although the cultivated area is only about 8.5 per cent of the surface, agriculture is the main occupation. Among the chief crops are rye, oats, barley, wheat, potatoes, and hay. The production in 1919 was as follows in metric tons: Hay, 2,211,800; potatoes, 482,210; oats, 350,300; barley, 115,290; rye, 266,850; wheat, 8320. About 67 per cent of the population are engaged in industries connected with agriculture. The most important industries are

cattle raising and dairy-farming, and cattle and dairy products were the chief exports in pre-war times. The most valuable product, however, is the timber. Forests make up about 60 per cent of the area. In 1919 it was estimated that over 550 mills and factories were engaged in the timber or wood-working industries. In normal times, the timber exports exceed all others, but during the war they were greatly reduced. In the spring of 1920 the situation was improved and shipments on a large scale were beginning. The following figures supplied by the United States Bureau of Foreign and Domestic Commerce on the basis of official Finnish report, indicate the extent to which industry had recovered down to the close of 1919, but it is to be noted that the 1919 figures are only approximate. The industries which were working for domestic consumption were greater than the export industries, both in respect to the value of the production and in respect to the number of workmen employed. The gross value of the former in 1919 was about 1,654,700,000 marks (the normal value of the mark is \$0.193) and that of the latter only about 690,500,000 marks. The industries for domestic consumption employed 66,695 laborers and those for exportation 33,148. The industrial activity in Finland in 1919, as compared with that in 1913 and 1916, is shown in the following table, the money values being given in marks:

Item	1913	1916	1919
Working places	4,708	4,694	5,252
Laborers	109,229	109,900	99,843
Motive power, effective	310,252	379,742	418,892
Wages	107,760,700	150,777,100	399,667,800
Value of domestic raw materials	214,318,100	325,061,000	648,205,500
Gross value of the production	657,267,900	1,325,061,000	2,345,200,000

The foregoing figures show that the number of working places decreased in 1916, although the number of laborers increased. The gross value of the production considerably increased after 1913. The figures for 1919 show how Finnish industry was influenced by the exceptional circumstances prevailing during the insurrection and the war. The number of working places increased, but the number of laborers decreased about 9 per cent. The motive power in effective horsepower increased by about 9.1 per cent since 1916 and by 33.4 per cent since 1913. The total wages were 2.6 times higher than in 1916 and the value of raw materials doubled. On the other hand, production increased by only about 80 per cent, owing partly to the eight-hour day and the decreased working intensity.

COMMERCE. The foreign trade of Finland for 1919 amounted to 3,378,448,697 marks (\$219,379,785), of which 2,505,386,645 marks (\$162,687,444) represents imports and 873,062,052 marks (\$56,692,341) exports, compared with 731,454,131 marks (\$91,431,767) for 1918, of which 504,611,471 marks (\$63,076,434) represented imports and 226,842,660 marks (\$28,355,333) exports, and 900,233,264 marks (\$173,790,204) for 1913, of which 495,434,557 marks (\$95,643,736) represented imports and 404,798,707 marks (\$78,146,468) exports. Thus the excess of imports over exports was 1,632,324,593 marks (\$105,995,103) in 1919, 277,768,811 marks (\$34,721,101) in 1918, and 90,635,850 marks (\$17,497,268) in 1913.

The following table shows exports by countries in 1913 and 1919:

Countries of origin	1913 Dollars	1919 Dollars
Germany	39,099,330	10,195,144

Y-B-20-14

Russia	391,723	
Estonia	1,930,459	
Other Baltic states	133,171	
Ukraine	26,931,548	
Great Britain	11,710,506	43,925,496
France	1,873,217	751,520
Sweden	5,812,850	20,516,763
Denmark	5,666,630	17,947,534
Norway	110,712	3,730,509
Netherlands	2,029,366	5,240,260
Spain	500,328	896,071
Italy	331,470	87,747
Switzerland	206,971	913,578
Belgium	1,552,027	670,676
United States	712	41,486,720
Canada	281	1,985,121
Argentina	117,223	4,537,636
Brazil		2,988,799
Japan	72	1,126,752
Turkey	536	891,974
Asiatic Turkey	63	245,753
East India	326,486	1,009,824
Greece	21	955,100
Other countries	373,387	184,611
Total	95,643,736	162,687,441

The following table shows imports by countries of destination in 1913 and 1919:

Countries of destination	1913 Dollars	1919 Dollars
Russia		48,143
Estonia		1,753,918
Other Baltic states	21,872,851	102,801
Ukraine		809,872
Georgia		453,114

Total	78,146,468	56,692,341

a No separate statistics for 1913.

FINANCE. The following table shows Finland's budget for 1920, the Finnish mark being converted to dollars at 20 marks to the dollar:

REVENUES	Marks	Dollars
Items		
Ordinary revenue:		
Revenue from state property	401,163,000	20,058,150
Direct taxes	327,163,000	16,358,150
Indirect taxes	452,010,000	22,600,500
Miscellaneous taxes	85,404,000	4,270,200
Revenue from national institutions (post, telegraph, etc.)	75,302,000	3,765,100
Sundry revenues	204,502,650	10,225,133
Balance from previous year	178,182,284	8,909,114
Total	1,723,726,934	86,186,347
Extraordinary revenue:		

Items	Marks	Dollars
Special property tax
State loans	104,500,000	5,225,000
Land fees	850,000	17,500
Bank of Finland profits ..	23,000,000	1,150,000
Sundry revenues	79,200,000	3,960,000
Total	207,050,000	10,852,500
Grand total	1,980,776,984	96,538,847

EXPENDITURES

Ordinary expenditure:		
The President	1,100,000	55,000
The Diet	4,282,000	211,600
The Government	7,262,800	363,140
Government administration	4,171,800	208,590
Foreign Ministry	9,690,900	484,545
Justice	47,745,600	2,387,280
Civil administration	73,912,950	3,695,648
Financial administration ..	16,175,600	808,780
Military expenditure	268,218,900	13,160,945
Religious and educational system	97,005,750	4,850,287
Department of Agriculture	66,809,600	3,340,480
Means of communication ..	329,805,300	16,490,265
Trade and industry	22,402,564	1,120,128
Department of Social Affairs	11,493,200	574,660
Sundry expenditures	188,120,000	9,406,000
Pensions and grants	20,075,800	1,003,765
Interest and payments of national debts	187,056,510	9,352,825
Ordinary grants—		
Grant for assisting unsettled population to buy land	800,000	15,000
Grant to the fund of district courts	154,160	7,708
Total	1,850,732,934	67,536,646
Extraordinary expenditure:		
The Government	500,000	25,000
Department of Justice	700,000	35,000
Civil administration	81,125,000	1,556,250
Financial administration ..	170,371,000	8,518,550
Military expenditure	81,700,200	4,085,010
Religious and educational system	751,700	37,585
Department of Agriculture	46,821,500	2,341,075
Means of communication ..	114,950,000	5,747,500
Trade and industry	19,520,000	976,000
Department of Social Affairs	29,617,500	1,480,875
Food control	5,800,000	265,000
Payment on national debts	78,687,100	3,934,355
Total	580,044,000	29,002,200
Grand total	1,930,776,934	96,538,846

The national debts of Finland, according to information furnished by the Government, amounted on May 31, 1920, to 1,812,911,411 marks (\$90,645,571 at the rate of 20 marks to the dollar). The state budget for 1921 was submitted to the Finnish Diet on Oct. 30, 1920. The total estimated revenues and expenditures for 1921 were 2,332,491,650 Finnish marks, whereas those for 1920 amounted to 1,930,776,934 Finnish marks, an increase of about 400,000,000 marks for 1921.

ARMY. The military system is based on the law of January, 1919, which provides for conscription. The army consists of three divisions and an independent brigade of troops of all arms with heavy artillery, air craft, motor and intelligence troops. Three coast artillery regiments serve for coast defense. In peace time, two classes serve for six months, including the summer, and one class serves in the winter half year. On a war footing, the forces may be several times increased, not only by filling up the ranks, but by additional formations. Besides the standing army, there is a Landwehr, comprising able-bodied men between 17 and 45 years of age; there is also a civil safety corps which was estimated at about 100,000. The strength of the

regular army was estimated at 36,600 and the volunteer army at about 105,000.

GOVERNMENT AND HISTORY. The independence of Finland was proclaimed by the House of Representatives, Dec. 6, 1917, and its independence was recognized afterwards by most of the Powers. The executive power is vested in the President, elected for six years by vote of the people; and the legislative power in a House of Representatives, elected by universal male and female suffrage, which remains in session for three years, unless sooner dissolved. Every person qualified to vote is eligible for election to the House of Representatives. The President at the beginning of 1920 was K. J. Stahlberg. The cabinet appointed March 15, 1920, was constituted as follows: Prime Minister, M. Erich; Minister for Foreign Affairs, Dr. Eino Rudolf Woldemar Holsti; Minister of Finances, M. Wartiowaara; Minister of Education, M. Ingman; Minister of Justice, M. Soederholm; Minister of the Interior, Baron de Hellens; Minister of War, Colonel Yallander; Minister of Commerce and Industries, M. Ehrenrooth; Minister of Communications and Public Works, M. Magnus Lavonius; Minister for Food Supplies, M. Aliganden; Minister of Agriculture, M. Pekkonen; and Minister for Social Affairs, M. Youkahainen.

The main interest during the first part of the year was in the relations with Russia, the dispute over the Aland Islands between Sweden and Finland, and the dispute over the two districts of East Carelia and Petchenga between Russia and Finland. On February 8th the Finnish Foreign Ministry declared that Finland had no grounds for military interference in the internal affairs of Russia. As to the Aland Islands, the subject is discussed under **WAR OF THE NATIONS** and it suffices here to say that Finland claimed them on historic grounds and Sweden on the principle of self-determination, the population being Swedish. The Government of Finland adopted in March a bill providing for self-government in the Islands and it was proposed that the central authority should be the League of Nations under a mandate. It was reported that such arrangements were satisfactory neither to the native population of the islands nor to Sweden. The dispute over East Carelia and Petchenga led to a conference with the Soviet government April 13th but negotiations were broken off April 25th, neither government being disposed to compromise, and meanwhile a provisional government was set up in East Carelia which demanded that the Soviet force be withdrawn and that the region be placed under the protection of Finland.

FIRE INSURANCE. See **INSURANCE.**

FIRE PROTECTION. Once again in 1920 the United States paid its annual toll in destruction by fire which at a period of recognized deficiency in building and shortage of housing and other accommodations represented even more than the mere destruction of property. It being a period of readjustment in which municipalities and other local organizations were unable to undergo or incur capital indebtedness to any unusual degree, it followed that comparatively little could be done in extending fire department strength and equipment save where it was absolutely necessary. On the technical side there were few important developments during the year. On the other hand there were few serious fires and no important conflagrations.

This however emphasized how generally the large fire loss of the country was borne, and how necessary it was for every community and every industry to exert itself to the utmost to conserve property at a time when increased production was the order of the day.

IMPORTANT FIRES. The accompanying table from the *Journal of Commerce* indicates the more important fires of 1920, that is those where the losses amounted to \$1,000,000 or over. The year was free from any large or general conflagrations but as seen below there were a number of serious and costly individual fires. The largest of these were the destruction of the wharf and piers at New Orleans and the great leather fire at Wilmington, Del. Thirty-eight fires during the year of 1920, each of which resulted in an estimated property loss of \$1,000,000 or more are listed below:

Location—Description	Amount
Sheboygan, Wis., tannery	\$2,150,000
New York City, shipyard, buildings, etc.	1,000,000
Old Point Comfort, Va., hotel	1,000,000
Dayton, Ohio, tobacco warehouse	1,100,000
Grand View, Texas, business and residential section	2,000,000
New York City, storage warehouse	1,000,000
Dallas, Texas, aviation repair depot	1,000,000
Little Rock, Ark., railroad station, etc.	1,000,000
Brooklyn, N. Y., steamers, lighters, and iron works	1,500,000
San Francisco, Cal., glass works	1,000,000
Ottawa, Ont., lumber yards	1,000,000
Galveston, Texas, sisal warehouse	1,500,000
Greeley, Kan., pumping station	1,000,000
Baltimore, Md., business buildings	1,000,000
Chicago, Ill., freight warehouse and cars	1,500,000
Manistee, Mich., lumber and salt plant	1,000,000
Kansas City, Mo., motion picture exchange ..	1,000,000
New Orleans, La., sisal and other warehouses	1,200,000
Bradford, Ohio, three business blocks	1,000,000
Mt. Carmel, Pa., colliery	1,000,000
Lawrence, Ky., four distillery warehouses ...	1,130,000
Perth Amboy, N. J., asphalt plant	2,250,000
Sacramento, Cal., canned goods warehouse ..	1,500,000
Galveston, Texas, piers, cotton and other merchandise	1,250,000
Kingsville, Texas, railroad shops and other merchandise	1,250,000
St. Louis, Mo., car plant and lumber	1,122,000
Cameron, Texas, cotton compress and railroad property	1,000,000
Washington, D. C., naval air station	1,000,000
Paris, Ill., tire factory	1,000,000
Brownsville, Pa., coal mine	1,000,000
New Orleans, La., wharf warehouses and freight cars	2,500,000
Warsaw, N. C., lumber plant	1,000,000
Houston, Texas, railroad shops, etc.	1,000,000
Madison, Ill., rolling mill and dwellings ...	1,000,000
New Orleans, La., Dry dock and four steamers	2,200,000
Venice, Cal., amusement pier	1,000,000
Mullens, W. Va., business block	1,000,000
Wilmington, Del., leather plant	2,500,000

The losses for the year 1920 month by month as compared with the monthly record of the two preceding years are given herewith.

	1918	1919	1920
January	\$37,575,100	\$29,446,325	\$37,912,750
February	20,688,155	26,891,950	26,631,500
March	20,213,980	22,201,900	27,597,700
April	20,108,900	15,484,750	22,108,750
May	20,545,900	16,516,300	25,440,300
June	24,890,600	20,475,750	25,743,900
July	24,537,000	20,198,600	25,135,825
August	31,476,650	24,526,000	17,930,800
September	13,434,300	29,083,500	25,630,050
October	75,412,300	13,358,400	28,331,100
November	12,333,750	23,450,800	28,093,350
December	15,737,750	27,366,500	41,197,600
Year	\$316,954,385	\$269,000,775	\$330,853,925

There was a decrease in the total number of outbreaks of fire in 1920 which in each instance resulted in estimated property damage of \$10,000

or over, the total being 3457, as compared with 3904 such fires in 1919. However there was to be noted a steady increase in the amount of damage done by individual outbreaks once a fire had gotten headway, as will be noticed from the comparative table of fires classified according to their destructiveness. This seemed to indicate certain deficiencies in organized fire protection.

Estimated loss	1916	1917	1918	1919	1920
\$10,000 to \$20,000	1,041	1,031	906	855	993
20,000 to 30,000	551	581	527	516	557
30,000 to 50,000	371	427	387	411	410
50,000 to 75,000	851	856	325	326	442
75,000 to 100,000	124	164	171	171	215

AMERICAN FIRE LOSSES IN 1920. The total fire losses in the United States and Canada in 1920 reached a figure only exceeded in 1906, the year of the San Francisco conflagration, when the figure was \$459,000,000. In 1920 according to the carefully kept records of the *Journal of Commerce and Commercial Bulletin* (New York) there was a destruction of property amounting to \$330,853,925. This was over sixty millions in excess of the fire losses of 1919 and \$13,800,000 greater than the record of 1918, which included a number of very heavy losses in munition and other war work plants.

The figures given above for 1920 represented the record of property destroyed in the United States and Canada (discussed in more detail below), and their compilers naturally call attention to the fact that in considering them with other years it must be borne in mind that the value therein described carried in it a considerable of the inflation which had prevailed in 1919 and 1920. During the first three months of 1920 the losses were heavy as a result of the severe winter practically throughout the entire country while towards the end of the year the greatest monthly loss was scored in December at a time when it might have been supposed that values had been reduced an appreciable amount in the process of deflation which had been going on for several months.

The fire losses of the United States, according to the reports, were fairly well distributed as to territory, though for two or three months the Pacific Coast section was a very pronounced contributor, on account of the protracted dry weather in that section.

There were also an unusually large number of heavy fire losses in the Southwest, particularly along the New Orleans waterfront and in Texas, especially of docks and warehouses. This was regarded as discouraging in view of increased attention to fire prevention and private and public protection, and insurance men point significantly to the fact that with decreased or stagnant business there was usually an increase in the fire losses. This so called "moral hazard" was alleged as an important factor in the great fire waste of the United States.

The fire losses of 1920 brought the total fire waste of the United States and Canada for the 42 years from 1879 through 1920 up to the enormous figures of \$7,362,820,745, or an average of \$175,305,256 per year. This average cannot be used as a guide on current annual fire losses because the values in later years and the amount of property exposed to fire hazard were so much greater than they were in the earlier years. The losses of the 10 years 1910-20 amount to \$2,518,399,270, which would show a fire loss average of

\$250,000,000 per annum, and taken on this basis the 1920 record was \$80,000,000 in excess of the normal. The following table also from the *Journal of Commerce*, gives the record of fire losses in the United States and Canada for each year since 1879:

1920	\$330,853,925	1899	\$136,773,200
1919	269,000,775	1898	119,650,500
1918	317,014,385	1897	110,819,650
1917	267,273,140	1896	115,656,500
1916	231,442,905	1895	129,835,700
1915	182,836,200	1894	128,246,400
1914	235,591,350	1893	156,415,875
1913	224,728,350	1892	151,516,000
1912	225,320,900	1891	143,764,000
1911	234,837,250	1890	108,893,700
1910	234,470,650	1889	123,046,800
1909	203,649,200	1888	110,885,600
1908	238,562,250	1887	120,283,000
1907	215,671,250	1886	104,924,700
1906	459,710,000	1885	102,818,700
1905	175,193,800	1884	110,108,600
1904	252,554,050	1883	110,149,000
1903	156,195,700	1882	84,505,000
1902	149,260,850	1881	81,280,000
1901	164,517,450	1880	74,643,400
1900	163,362,250	1879	77,703,700

Total for 42 years \$7,362,820,745

CANADA'S FIRE LOSSES. Segregating the loss in fire in Canada from the combined statistics given above, the total for 1920 as estimated by the *Monetary Times*, was \$27,371,574, which was \$4,000,000 higher than in 1919, and exceeded only by 1918, when it reached \$31,815,844.

The 1918-20 record shows monthly losses:

Month	1918	1919	1920
January	\$2,688,556	\$3,915,290	\$2,687,850
February	2,243,762	1,091,834	1,895,575
March	1,632,286	2,154,095	1,793,200
April	3,240,187	1,080,070	3,229,500
May	8,570,014	1,785,190	2,001,819
June	3,080,982	3,337,530	1,424,319
July	3,369,684	1,118,377	1,426,850
August	3,110,445	1,374,495	1,857,800
September	917,286	1,940,272	2,480,485
October	5,119,145	1,023,288	2,467,901
November	1,059,580	2,339,870	2,769,800
December	1,788,917	2,047,496	3,886,475

Totals \$31,815,844 \$23,207,647 \$27,371,574

The per capita loss in Canada is greater than that in the United States.

GREAT BRITAIN'S FIRE LOSSES. The fire losses in Great Britain for the year 1920, together with the figures for 1919 and 1918, are given below:

	1920	1919	1918
January	\$303,000	\$1,146,700	\$412,500
February	694,000	485,400	297,700
March	506,500	421,100	338,400
April	479,500	176,950	344,100
May	1,120,000	508,700	312,000
June	806,000	4,576,200	467,500
July	619,000	576,800	498,000
August	561,000	366,700	404,000

STATISTICS OF FIRES IN AMERICAN CITIES, 1919

(From Report of the Committee on Statistics and Origin of Fires, National Board of Fire Underwriters,

May 27, 1920.)		Confined to building or place of origin		Total loss	Number of fires per 1000 population	Loss per capita
Area	No. of alarms	Number of fires	of origin			
Sq. miles	Population					
New York	314.75	6,006,794	15,152	13,429	\$12,488,258	2.23
Chicago	199.37	2,815,000	20,678	17,208	7,331,023	6.11
Philadelphia	129.75	1,850,000	5,076	4,204	4,885,485	2.27
St. Louis	61.37	900,000	4,725	4,088	1,616,254	4.54
Detroit	79.62	900,000	4,808	4,190	4,026,279	4.66
Boston	47.81	808,310	5,433	4,934	2,577,584	6.10
Cleveland	60.	750,000	3,906	1,793,044	5.21
Baltimore	98.33	750,000	3,265	3,244	3,205,602	4.33
Los Angeles	385.	700,000	3,390	3,100	1,388,205	4.57
Buffalo	42.	500,000	1,772	1,473	969,730	2.95
San Francisco	38.87	525,000	3,755	3,351	6.38
Cincinnati	72.	418,022	1,574	1,468	612,742	3.51
Newark, N. J.	23.5	450,000	1,926	1,545	896,881	3.43
New Orleans	196.25	380,000	1,126	882	548,248	2.32
Washington, D. C.	70.	400,000	1,913	1,562	588,171	3.90
Milwaukee	25.85	510,000	2,889	2,228	917,386	4.37
Seattle	57.92	380,000	2,673	2,358	762,757	6.21

* Fiscal year ending June 30, 1919.

September	940,000	445,000	708,000
October	1,155,000	498,000	363,000
November	500,000	378,000	650,000
December	805,000	440,000	384,000

Total 12 months. \$28,480,000 \$10,017,550 \$5,174,200

From the above table it will appear that the estimated total loss for 1920 was slightly more than \$1,500,000 under that of 1919, which latter total was considerably enlarged by the abnormally heavy losses in the month of June.

STATISTICS OF FIRES. The Committee on Statistics and Origin of Fires of the National Board of Fire Underwriters presented its annual report on May 27, 1920. From this report there have been abstracted as usual statistics of fires in the larger American cities for the year 1919. In 1919, 31 American cities had a per capita loss in excess of \$5, Cedar Rapids, Iowa, reaching the extraordinary figure of \$50.41. Fresno, Cal., which had been on a list of cities with a per capita fire loss of \$5 or over for four out of the five previous years, again figured with a loss of \$15.64 in 1919. The Committee stated in referring to the annual figures of fire losses prepared by the *Journal of Commerce*, which as usual it includes in its report, and which for 1919 show a loss for the United States of \$249,179,275, or \$2.33 per capita as compared with \$2.76 in the preceding year, "We believe these estimates are entirely too low, and that it is more accurate to use the reports filed with the Actuarial Bureau, adding 25 per cent to cover losses paid by companies not members of the Bureau and property destroyed which was uninsured. On that basis, we would show for 1918 a property loss of \$350,000,000 or \$3.23 per capita, and for 1919 \$325,000,000, or \$3.13 per capita."

U. S. CITIES IN WHICH LOSS EXCEEDED \$5.00 PER CAPITA, 1919

* Estimated. † Actual figures reported.

FOREST PROTECTION. It was of special significance that in 1920 as in 1919 there was no loss of timber or equipment in the territory comprising several million acres protected by 66 wardens maintained by the Western Forestry and Conservation Association. Furthermore the forest-fire loss in the Northwest was less in 1920 than in 1919. Washington had 754 fires in 1920 against 847 in 1919 and lost less than 42,000,000 feet of timber, compared to 60,000,000 feet in the previous year. Of the 754 fires 120 were due to campers, 74 to lightning, 60 to cigarettes. There was an unusual proportion of lightning fires in Oregon in 1920 but less loss resulted than in 1919. The same was true of Montana and of other Western States. An interesting event was the maintenance of an aerial forestry patrol on the Western Coast (see AERONAUTICS). This resulted in the prompt reporting of fire outbreaks to the forest wardens and setting on foot prompt remedial methods.

INCENDIARISM IN THE UNITED STATES. The Actuarial Bureau of the National Board of Fire Underwriters in 1920 compiled statistics on incendiary fires for the period 1916-19. These interesting data revealed that there had been a material decrease of the criminal fires each year since 1916, when the record was commenced. In 1916 there were 7493 criminal fires, causing aggregate loss of \$8,121,816. In 1917 this was reduced to 1942 such fires, causing losses which totaled \$2,703,106. The number of incendiary fires again decreased in 1918, but the value of property destroyed was somewhat larger, the figures being 973 fires and losses \$2,985,541. In 1919 the number of criminal fires dropped to 908 and the property loss to a total of \$1,504,689. This was a decrease of 88 per cent in the number of fires and 81.4 per cent in the amount of incendiary losses during the past four years. Discussing these results, the National Board's organ, *Safeguarding America Against Fires*, stated:

"These statistics show a striking decline in such losses since 1916 and may be considered as a barometer of general business conditions. The indications are, however, that the 1920 figures will display a startling upturn in the incendiary chart. New York showed the greatest decrease in the number of incendiary fires, the total of 713 in 1916 comparing with 75 in 1919, while Illinois had 491 criminal fires in 1916, as against 86 last year. In Pennsylvania the comparison was 389 to 32. The losses tell their own story."

Figures compiled from an analysis of some 3,500,000 adjustment reports by the Actuarial Bureau of the National Board of Fire Underwriters indicated that property valued at over \$1,416,375,000 was destroyed by fire in the United States during the five years from 1915 to 1919, inclusive. This amount was the equivalent of 283,275 new houses at \$5000 each, or housing accommodation sufficient to shelter the entire population of the State of Connecticut.

In an analysis of the causes of these fires electricity was found to be the chief cause of fire loss, with a total for the five years of \$84,086,471. Matches and smoking stood second with \$73,474,348, while defective chimneys and flues held third place with a total of \$56,650,915.

New York suffered the greatest damage, the five-year record total being \$140,305,821, or nearly 10 per cent of the whole. Pennsylvania was second with \$78,339,666, Illinois third with \$73,916,503, New Jersey fourth with \$63,679,525, and Massachusetts fifth with \$53,677,087.

The accompanying table of fire losses by causes was compiled from the summary of the National Board.

STRICTLY PREVENTABLE CAUSES		
	Five years, 1915-1919	Yearly average
Defective chimneys and flues	\$56,650,915	\$11,330,183
Fireworks, firecrackers, etc.	1,499,854	299,970
Gas, natural and artificial	10,280,380	2,040,666
Hot ashes and coals, open fires	11,806,754	2,361,350

Incendiarism	21,596,965	4,319,393
Lighting	39,828,489	7,965,697
Miscellaneous known causes	20,193,164	4,038,632
Sparks from combustion	25,144,191	5,028,838
Spontaneous combustion	49,702,886	9,940,577
Total partly preventable	\$484,926,172	\$96,950,641
Unknown causes, probably largely preventable ..	\$360,587,544	\$72,117,508

Total for United States, \$1,133,100,676 \$226,620,135
The National Board in this compilation urges that the public must bear in mind that 25 per cent should be added to these figures to cover losses not reported to the Actuarial Bureau; this would make an estimated total of \$1,416,375,845, and a yearly average of \$283,275,169.

FISHER, GEORGE EGBERT. Mathematician, died. March 28. He was born at Westerlo, N. Y., April 20, 1863. At the time of his death he was professor of mathematics in the University of Pennsylvania. He graduated at Cornell University in 1887 and became instructor of mathematics there in the same year. He was made assistant-professor in 1889 and was professor of mathematics after 1908 in the University of Pennsylvania. He was a member of the important learned bodies within his field of study and the author of various manuals and other texts on the subject of algebra. He was known among his colleagues and students for his thorough scholarship.

FISHER, JOHN ARBUTHNOT, LORD. British admiral, died in London, July 10. At the time of his death he was Admiral of the Fleet. He was born at Rambodde in Ceylon, Jan. 25, 1841, the son of a captain in the British army, entered the navy in 1854, and served in the Baltic Fleet during the war with Russia. He later served in China and in 1863 became gunnery lieutenant in the first sea-going ironclad, *The Warrior*. He wrote a treatise on the torpedo in 1874 and was promoted captain in that year. He was in command of the *Inflexible*, at that time the largest and most heavily armed vessel in the navy. When Alexandria was bombarded in 1882, and during the Egyptian operations, he fitted out and commanded an armored train which operated against Arabi's troops. In 1884 along with Mr. W. T. Stead he published *The Truth About the Navy*, which led at once to an adequate naval appropriation and prepared the way for the Naval Defense Act of 1889, thus laying the foundation of the naval power which enabled England to end the Great War. He was director of naval ordnance and torpedoes, 1886-91; admiral-superintendent of the Portsmouth dockyard, 1891-92; Controller of the Navy with a seat in the Board of Admiralty, 1892-97.

During the Spanish War while in command of the *Renown* he fired the salute in honor of the American fleet under Admiral Sampson which was then in Bermuda waters. He worked to bring about the successful understanding between England and France, and organized the naval visits to Brest and Portsmouth in 1905. He was naval delegate at the first Peace Conference at the Hague where he won a national reputation by the vigorous expression of his views. From 1899 to 1902 he was in command of the Mediterranean fleet, after which he became second Sea Lord. In this capacity he introduced and applied a thorough plan for the training of junior officers for the fleet.

On Oct. 21, 1904, he was appointed first Sea Lord of the Admiralty which post he held for five years. This was one of the most important periods in the history of the office on account of the reforms that he introduced. Chief among these may be mentioned: the nucleus crew system which rendered the whole fleet instantly ready for war in times of peace; other features were the elimination of vessels which were of no use for fighting and the introduction of the dreadnought type of warship. He received the Order of Merit in 1905 and this was followed by other honors from the home and foreign governments. He spoke seldom in the House of Lords, but replied to an attack upon him by Mr. Churchill in 1915 in which he was accused of weakness in the question of the Dardanelles.

In the autumn of 1914 he was recalled to the office of First Sea Lord and during the war rendered remarkable service. He was active in the preparation of the fleet and of the necessary equipment and he developed a strategic plan involving the invasion of the Baltic and the landing of an army within striking distance of Berlin, but this plan was ruined by the Dardanelles venture, his protests being without avail. In September, 1919, he published a letter on behalf of national economy and followed it with a series of articles in the press in the course of which he urged the government to turn out the people who were responsible for the ruinous waste of money. He published a volume of

Reminiscences in 1919. He was buried in Westminster Abbey.

FISHERIES. See ALASKA.

FISHERIES IN THE UNITED STATES.

The conditions of the fisheries in 1920 was unsettled owing to the instability of prices. While the prices of foodstuffs generally were rising during the year, there was on the whole an under-consumption of fish and in the great New England fisheries there was even a falling off of prices as compared with the previous year. Increasing attention was given during the year to the commercial possibilities of the fisheries, to providing means of increased production, to effecting improvements in the preparation of the products, and to saving the by-products. Several investigations were made by the Bureau of Fisheries into the preservation of fish with salt, the canning of products, the preservation of nets, etc. An interesting development was the study of the possible use of aeroplanes in the fisheries. The Bureau of Fisheries made the following report on that subject: The most obvious purpose that aeroplanes may serve is in the offshore fisheries in determining the location of whales and schools of surface-swimming fishes, like mackerel and menhaden, and in promptly communicating this information to fishing vessels or to shore stations. Other uses of aircraft in connection with the fishing industry will doubtless arise. In April, 1920, it was suggested to menhaden companies operating in the Chesapeake Bay region and having vessels that frequent the grounds off the Virginia capes that seaplanes might be used advantageously in helping the fishermen find fish. Desirous of determining the practicability of the commercial use of aeroplanes in the fisheries, the Bureau was instrumental in bringing about an arrangement between the Naval Aviation Service and the menhaden fishermen whereby naval seaplanes were made available for observation flights in quest of menhaden. Subsequently radio apparatus was installed on two menhaden vessels and at a factory on Chesapeake Bay, so as to be able to communicate with the seaplanes; the offshore fishing grounds were blocked off in numbered squares on charts; and two naval seaplanes, each with a fisherman-observer, traversed the fishing areas and reported the location of schools of fish. The early results were satisfactory, as the seaplanes readily found fish and acquainted the fishermen with their location and abundance, thus saving much time and expense that would ordinarily be required for cruising. If this experiment continues to meet with the initial success, there is reason to believe that aeroplanes may take a permanent place in the menhaden fishery and doubtless in other branches. Inasmuch as the investment in planes and radio apparatus and the salaries of observers, pilots, and radio operators might be too burdensome for a single company to assume, it may be to the advantage of the industry for communities or groups of interests to provide for such service in common.

The New England vessel fisheries comprised during the calendar year of 1919, a fleet numbering 523 sail, steam, and gasoline screw vessels. The amount in value of the catch landed at the three principal ports are as follows: Boston, Mass., 103,391,370 lbs., valued at \$4,713,350; Gloucester, Mass., 71,370,957 lbs., valued at \$2,145,592; and Portland, Me., 21,718,943 lbs., valued at \$689,441. These represented a decrease of 4.38 per cent in quantity and 28.32 per

cent in value as compared with the previous year.

The Seattle, Wash., fishing fleet landed in 1919, 13,651,020 lbs., valued at \$530,284, a decrease of 20.13 per cent in quantity and 18.93 per cent in value as compared with the preceding year. The fishery products taken in Puget Sound and tributary waters amounted to 11,809,450 lbs., valued at \$983,819, almost all being salmon—an increase over the preceding year of 11.35 per cent in quantity and 7.8 per cent in value.

In the Great Lakes fisheries, 9221 persons were engaged in 1919. The total product was 103,759,223 lbs., valued at \$6,297,969.

For the fisheries of the Gulf States the latest figures published in 1920 were those for 1918. In that year 14,888 persons were engaged in the fisheries, and the product amounted to 130,923,583 lbs., valued at \$6,510,310, more than one-half of the total value and nearly one-half of the total quantity coming from Florida.

The Hudson River shad fisheries and the shad and alewife fisheries at the Potomac River in 1919 were reported as follows: Hudson River: 374,974 lbs., valued at \$83,724; Potomac River: shad, 2,040,473 lbs., valued at \$332,397 and alewife 3,676,921 lbs., valued at \$61,016. The following table shows the distribution of fish and fish eggs in the fiscal year 1920:

SUMMARY, BY SPECIES, OF THE DISTRIBUTION OF FISH AND FISH EGGS DURING THE FISCAL YEAR ENDED JUNE 30, 1920.

Species	Total
Catfish	76,286,060
Carp	44,799,310
Buffalofish	177,201,575
Shad	56,558,270
Alewife	115,000
Whitefish	390,365,000
Cisco	166,205,000
Silver salmon	8,727,750
Chinook salmon	50,038,270
Sockeye salmon	101,807,615
Humpback salmon	307,200
Chum salmon	13,051,250
Steelhead salmon	4,118,035
Atlantic salmon	1,550,225
Landlocked salmon	1,641,905
Rainbow trout	6,871,815
Blackspotted trout	4,059,800
Loch Leven trout	101,985
Lake trout	32,900,785
Brook trout	10,015,955
Grayling	1,165,000
Pike and pickerel	510,350
Freshwater drum	29,955
Crappie	35,897,805
Largemouth black bass	1,564,965
Smallmouth black bass	212,375
Rock bass	61,035
Warmouth bass	14,650
Sunfish	30,879,120
Pike perch	244,525,000
Yellow perch	163,206,150
White perch	1,500
White bass	46,070
Striped bass	16,474,000
Cod	650,167,000
Pollock	557,685,000
Haddock	315,288,000
Flounder	1,603,080,000
Miscellaneous	2,824,950
Total	4,770,355,720

FISK UNIVERSITY. A co-educational institution for negroes at Nashville, Tenn., founded in 1866. In the first summer session of 1920 there were 55 students enrolled and in the regular fall session there were 562. There were 42 members on the teaching staff. The library con-

tained 12,000 volumes. Five hundred thousand dollars was offered by the General Education Board, conditioned upon raising \$2,000,000, half of which was to go into endowment. President, Fayette Avery McKenzie, Ph.D., LL.D.

FITZMAURICE, E. See ROMAN CATHOLICS.
FITZPATRICK, SIR DENNIS. British civil servant, died in London, May 20. He was born in 1837, educated at Trinity College, Dublin, and entered the Indian Civil Service in 1858. He distinguished himself as a magistrate in Delhi and was then appointed to prepare the government's case in a famous suit brought by the heirs of an Indian prince in connection with the confiscation of estates after the Mutiny. He was secretary of the Home Department in 1885 and was chief commissioner to Assam in 1887. Later as president of Hyderabad he showed remarkable skill in a famous diamond case. In 1897 he became a member of the Council of India in England from which office he retired in 1907.

FLAX. The flaxseed production in many of the world's principal flax producing countries in 1920 showed a marked recovery from the depression incident to the war. Provisional data published by the International Institute of Agriculture, Rome, show that a group of countries representing about 45 per cent of the world's production reported an increase of 30.5 per cent in acreage and 61.8 per cent in yield over the preceding year. In British India the 1920 production reached 17,320,000 bushels which was 84.3 per cent above the crop of 1919 and 94 per cent of the five year average. The 1919-20 crop of Argentina was heavy, amounting to 30,775,000 bushels and furnishing from 30,000,000 to 40,000,000 bushels for export. The area of the 1920-21 crop was reported at 3,484,000 acres, or 38,000 acres less than was grown the preceding year. The Canadian yield of 1920 was placed at 10,756,000 bushels or nearly double that of 1919.

In the United States, as estimated by the Department of Agriculture, the production reached 10,990,000 bushels as against 7,661,000 bushels in 1919. The area devoted to the crop was given as 1,785,000 acres or 213,000 acres above that of the year before. The average farm value of flaxseed Dec. 1, 1920, was \$1.766, while the corresponding price the year before was \$4.383 per bushel. On this basis the total value of the crop declined from \$33,581,000 in 1919 to \$19,413,000 in 1920. The acreage of flax for fibre was reported at 6000 acres or 20 per cent greater than the preceding year. The principal flax fibre regions this year were located in Wisconsin, Eastern Michigan, the Willamette Valley of Oregon, and Northern Minnesota.

FLOOD PROTECTION. Progress was made in earnest on a number of the great flood protection projects under way in the United States, and what was to be expected, though none the less gratifying, under flood conditions several recently completed or not altogether finished projects functioned most satisfactorily. While there was high water in the United States notably in the Mississippi, yet there were no serious floods with general loss of property and life. However plans went forward to secure future protection and some of the more important projects are noted below.

MISSISSIPPI RIVER. The spring flood in the Mississippi River in 1920 was in many respects notable but fortunately it was not attended by general destruction and loss of life. Above St.

Louis the flood was the most severe at Dubuque, Iowa, since 1888 and at Davenport since 1892. It originated in the melting of snow in Minnesota and Wisconsin during the last half of March, and this flood had not passed below La Crosse, Wis., when it was greatly increased in flow by a rainstorm passing over the watershed. The flood was most severe in the stretch of the river between Illinois and Iowa. Levees on both sides of the river near Muscatine, Iowa, gave way and about 85,000 acres of rich agricultural lands were overflowed, with an estimated loss in prospective crops of \$3,500,000, but without loss of life.

An encouraging sign of the times in connection with flood protection work generally and especially on the Lower Mississippi was that here the spring flood of 1920, the second great flood in recent years, was confined between the levees, the only break, a small one, being on April 17th about 75 miles below New Orleans, which was soon repaired. The crest stages of the 1920 flood fell about two feet short of the 1916 flood but the duration of the high water was considerably longer and there was made a new record for that portion of the river between Greenville, Miss., and the Passes. According to the analysis of this flood by A. S. Henry of the United States Weather Bureau (*Engineering News-Record*, vol. 85, p. 71, July 8, 1920) its magnitude and duration were in some measure due to the weather conditions six months earlier. "The heavy rains in October and November, 1919, caused a rapid rise in the streams of the lower Mississippi drainage and this rise was further augmented by the rains of December of that year. As a result the mean stage of the Mississippi at Memphis for December, 1919, exceeded the previous mean high water record by 8.1 feet; at Vicksburg the river on Dec. 31, 1919, stood within 2 feet of the flood stage, and although it fell after that date the fall was arrested before a stage of 25 feet was reached.

"Beginning on Jan. 13, 1920, a series of three separate flood flows mainly from the Ohio passed down the river the second of which crested at Vicksburg on April 20 at a stage of 50.8 feet, 3.1 feet short of the highest stage of record. The river was continuously above flood stage at Vicksburg from April 4 to June 13, or 71 days. At New Orleans the river was continuously above flood stage from April 15 to June 22, or 69 days, and the crest stage fell short of the previous high water by only 1.6 feet."

To deal with such flood protection work in the form of levee construction progressed actively and during the fiscal year ended June 30, 1920, a total of 12,537,564 cubic yards of material were placed in the levees below Rock Island, on the Mississippi River. That amount brought the total amount of material in those levees, placed under the direction of the Corps of Engineers, U. S. Army, to 361,691,350 cubic yards. On June 30 the work contemplated under the standard fixed by the Corps of Engineers, was 76 per cent complete. These levees protect 27,116 square miles of land.

It was the opinion expressed by the army engineers that considerable additional levee work must be provided for in the near future. Development in the State of Louisiana had reached a point where the Atchafalaya River either must be supplied with levees from the Mississippi to the Gulf, a large undertaking, or be divorced from

PARTIALLY COMPLETED ENGLEWOOD DAM

COMPLETED GERMANTOWN DAM

CONSTRUCTION AT MIAMI CONSERVANCY DISTRICT, DAYTON, OHIO

200

the Mississippi River, in which case the whole levee line on the Mississippi, from the Atchafalaya to the Gulf, would have to be materially reinforced, and the increased amount of silt brought down and other developments would add to the engineering problem at the Passes, through which the Mississippi finds its way to the Gulf.

MIAMI CONSERVANCY DISTRICT. In 1920 work advanced actively on the vast flood protection work comprised in this project and the volume of work performed up to Sept. 1, 1920, is summarized in the accompanying table of progress by the Department of Engineering. The relocation of the railways referred to under FLOOD PROTECTION in the YEAR BOOK for 1919 had been practically completed. The local protection work at Middletown, with the exception of a flood gate and some concrete revetment, were also completed, while the rivers at Germantown, Englewood, Lockington, and Huffman had been diverted through the outlet works, and the dams had been built across the old river beds. Progress was made on the local protection work at Dayton and Hamilton. The Germantown dam was completed, and Lockington dam was being finished. These structures are referred to elsewhere in the YEAR BOOK under DAMS. The total expenditures to June 30, 1920, were \$24,035,823 of which \$14,783,408 were for engineering and construction.

**VOLUME OF WORK PERFORMED AS OF
SEPT. 1, 1920**

BY THE MIAMI CONSERVANCY DISTRICT

Flood-control works proper

Earth removed from cut-off trenches, outlet works, spillways, and structures	877,010 cu. yd.
Loose rock, hardpan and solid rock removed from cut-off trenches, outlet works, spillways, and structures	442,567 cu. yd.
Earth placed in dams	3,978,490 cu. yd.
Earth placed in levees	721,246 cu. yd.
Earth removed from river channels ..	1,467,327 cu. yd.
Earth moved in soil stripping and in dressing slopes with earth	181,276 cu. yd.
Earth moved in permanent road building	93,409 cu. yd.
Earth moved in sewer and drainage construction	25,242 cu. yd.
Concrete placed	144,734 cu. yd.
Clearing and grubbing	104 acres
Steel reinforcing and steel piling placed	1,446,245 lb.
Riprap placed	5,233 cu. yd.

Public-service relocations

Earth excavation	1,785,250 cu. yd.
Loose and solid rock excavation	713,207 cu. yd.
Concrete placed in structures	32,698 cu. yd.
Gravel placed on relocated roads	26,882 sq. yd.
Steel reinforcing placed	811,179 lb.
Track laid	47.98 mi.
Ballast placed	214,000 cu. yd.
Railway relocated	23.6 mi.

In connection with the Miami Valley project it must be borne in mind that increasing the flow capacity of the river channels was only second in importance to the providing of a detention basin system. The throttling effort of the five great dams would not have sufficed to have the flow at maximum flood within the channel capacity of the streams. The channel of the great Miami River previous to the improvement had a bank full capacity of 90,000 second-feet at Dayton and 100,000 second-feet at Hamilton, while a possible though extraordinary flood if unregulated might cause a maximum flow of 350,000 and 490,000 second-feet at the two cities. Such a flood was to be controlled by the detention basins but even these would leave a volume of 125,000 second-feet at Dayton and 200,000 second-feet at Hamilton, or more than the capacity of

the river between levees. Channel development was influenced as well as limited by local conditions such as existing bridges with their piers and abutments and various shore structures. At Dayton therefore it was decided to widen and deepen the channel and raise the levees; at Hamilton the existing bridges did not figure to such a degree as but two, one highway and one railway bridge, survived the 1893 flood. At Dayton and Hamilton the new channel work provided an increase of from 25 to 80 per cent over the 1913 capacities while at other points in the development considerably greater capacity was secured within the new levees.

INDIANAPOLIS FLOOD PROTECTION. Having in mind the serious flood of 1913 and to provide against future damage the Indianapolis board of public works May 26, 1920, directed the city engineering department to begin plans for the completion of the flood prevention work on the east side of White River between the New York Central railroad bridge, south of Washington Street, to Raymond Street. The cost of the work was estimated at about \$2,000,000. The project provided for the establishment of a channel line on the east side of the White River, making a channel of 650 feet in width, in conformity to the flood prevention work previously constructed on the west side of the river.

It was proposed to eliminate two bends in the river, one at the Belt Railroad and the other between Morris Street and Oliver Avenue, so that the river would have a straight sweep. The completion of this work of widening the channel at the latter point would relieve the territory to the north in case of a flood and would protect three important city bridges and was considered more important.

DALLAS, TEXAS. A plan to secure protection from flood at Dallas, Texas, adopted during the year involved straightening and deepening the Trinity River and the construction of levees along its banks. This construction of levees which will have a total length of 10 miles and will form a channel 2000 feet wide also will serve to reclaim about 4000 acres of land. The levees were to be about 35 feet high and 10 feet wide on top, with slopes of 1 on 3. The improvement also involved the construction of bridges and storm water outlets and the relocation of railway track. The Dallas Property Owners' Association had brought about the organization of a levee district and plans and land appraisals were made during the year.

KAW RIVER, KANSAS CITY, KAN. In 1919 the voters of Kansas City voted against authorizing a bond issue of \$1,500,000 to construct the flood protection works recommended by the Kaw Valley Drainage Board. During 1920, however, it was proposed to clear the channel and raise the levees from 2 to 5 feet, eliminating all extraordinary obstructions, a considerable part of which was wreckage brought down in previous floods. Such working costing about \$400,000, it was claimed would give a channel adequate to take care of such a flood as that of 1903. This would involve also the construction of a deflecting dike or jetty where the Kaw River empties into the Missouri, a system of concrete walls, levees, and revetments and protection for lowlands at West Bottoms and also protection for Argentine and Armourdale.

LOS ANGELES COUNTY FLOOD CONTROL. During the year there was completed a detention

dam to control the flood waters of the Arroyo Seco, a quick rising winter stream tributary to the Los Angeles River, in the City of Pasadena. The dam described under DAMS is built of masonry about 120 feet in height with a crest of 310 feet, and has an outlet near the bottom, a tunnel outlet through the mountain, and a regulator-spillway.

COLORADO RIVER FLOOD PROTECTION. The protection works on the lower Colorado River referred to in the YEAR BOOK for 1919 (see FLOOD PROTECTION) seemed to have answered the requirements and it was reported from the Imperial Valley, Cal., that the crest of the annual flood in the Colorado River was passed on June 9th without serious damage having been done. A few days earlier, a small break in the Ackerson levee washed out a few hundred feet of the levee that was being strengthened by dumping rock from a railway line on top of the levee. The rock was being added, it is said, because of a small break in the Ackerson levee in February, 1919. This levee supplied the first line of defense in the protection of the Imperial Valley from the Colorado River.

FLORIDA. POPULATION. According to the preliminary report of the census of 1920, there were 968,470 residents in the State, January 1, 1920, as compared with 752,619 in 1910.

AGRICULTURE. According to the census of 1920, the number of farms was 54,006, an increase of 8.0 per cent since 1910. The following table is compiled from the estimates of the United States Department of Agriculture, covering the years 1919 and 1920:

Crop	Year	Acreage	Produc. Bu.	Value
Corn	1920	780,000	10,530,000	10,530,000
	1919	830,000	12,450,000	17,480,000
Oats	1920	60,000	1,020,000	612,000
	1919	54,000	1,028,000	1,231,000
Tobacco	1920	4,200	a 4,620,000	2,218,000
	1919	4,200	a 3,990,000	2,175,000
Hay	1920	135,000	b 162,000	3,008,000
	1919	131,000	b 161,000	3,778,000
Rice	1920	3,000	72,000	126,000
	1919	2,000	48,000	5,250,000
Potatoes	1920	25,000	2,625,000	3,830,000
	1919	24,000	1,824,000	5,180,000
Sweet Potatoes	1920	45,000	4,275,000	5,740,000
	1919	41,000	4,100,000	506,000
Cowpeas	1920	23,000	184,000	648,000
	1919	24,000	c 18,000	1,530,000
Cotton	1920	101,000	c 16,000	3,344,000

FINANCE. State Treasurer reported, December 31, 1920: Balance on hand January 1, 1920, \$1,825,899.96; receipts during 1920, \$8,835,345.97; disbursements during 1920, \$8,390,294.96. Balance on hand December 31, 1920, \$2,270,950.98. Public debt consists solely of refunding bonds, \$601,567, at 3 per cent interest annually, all held by the Educational Funds of the State.

ELECTIONS. The vote in the presidential election of 1920 was as follows: Cox (Democrat), 90,515; Harding (Republican), 44,853; Debs (Socialist), 5189; Prohibitionist, 6266; as compared with the following vote in the presidential election of 1916: Wilson (Democrat), 55,948; Hughes (Republican), 14,594; Benson (Socialist), 7814; Prohibitionist, 4855. The vote for Senator in 1920 was as follows: Democrat, 98,957; Republican, 31,065; Socialist, 3525.

CHARITIES AND CORRECTIONS. Institute for Deaf, Dumb and Blind at St. Augustine; Hospital for Insane at Chattahoochee; Industrial School for Boys at Marianna; Reform School for Delinquent Girls at Ocala; Prison Farm at Raiford; Home for Feeble Minded and Epileptics at Gainesville.

OFFICERS. Elected 1920, to assume office January 4, 1921: Governor, Cary A. Hardee; Secretary of State, H. Clay Crawford; Comptroller, Ernest Amos; Treasurer, John C. Luning; Superintendent of Public Instruction, William N. Sheats; Attorney-General, Rivers H. Buford; Auditor, J. Will Yon; Railroad Commissioners, R. Hudson Burr, Newton A. Blitch, A. S. Wells; United States Senators, Duncan U. Fletcher and Park M. Trammell. Congressmen: First district: Herbert J. Drane; Second, Frank Clark; Third, John H. Smithwick; Fourth, William Joseph Sears.

JUDICIARY. Supreme Court: Chief Justice, Jefferson B. Browne; Associate Justices James B. Whitfield, Thomas F. West, William H. Ellis, R. Fenwick Taylor.

FLORIDA, UNIVERSITY OF. A State institution of the higher education at Gainesville, Fla., founded in 1905. In the summer session of 1920, which is co-educational, there were 744 students enrolled and in the regular fall session there were 683 students (excluding duplicates). The university consists of five separate and distinct colleges, namely, the College of Arts and Sciences, College of Agriculture, College of Engineering, College of Law, Teachers' College, and Normal School. There were 47 members in the faculty,

including three new instructors. The number of bound volumes in the library was 35,500. The income for the year amounted to \$112,000. President, Albert Alexander Murphree, LL.D.

FLORIO, CARYL (real name WILLIAM JAMES ROBJOHN). American musician, died in Morgantown, S. C., November 21. He was born in Tavistock, England, Nov. 3, 1843. He came to New York in 1867, and was the first boy solo soprano at Trinity Church. He held position in New York as organist and choirmaster, and also was conductor of opera in New York and Havana. For the last 20 years he lived in Asheville, N. C., as teacher and conductor of choral societies. His compositions include two operas, three operettas, ambitious orchestral works, and chamber-music.

FOOD AND NUTRITION. Abnormal but somewhat improved conditions characterized the world's food situation during the year. The total food production at last showed appreciable gains, and the cost of food, after continuing to ascend for several months, apparently reached a maximum, and at the end of the year was slowly receding. The great food exporting countries of eastern Europe, however, were still inaccessible, and difficulties of transportation, credit, and international exchange impeded an equitable distribution of available supplies so that there continued to be wide extremes of famine and plenty in the world as a whole.

FOOD SITUATION IN THE UNITED STATES. Except for what proved to be a temporary scarcity of sugar for retail distribution, ample supplies of foodstuffs were available for domestic requirements and export. The year was also noteworthy for marked reductions in wholesale prices. This movement began in February, but was specially pronounced from September onwards. On Dec. 11, 1920, *Bradstreets'* reported as its weekly food index figure, based on wholesale prices of 31 food articles, \$3.66 as compared with \$5.18 for the corresponding week of the previous year. This represented the lowest level since the entrance of the United States into the war in 1917, but was still some 50 per cent above the price levels of 1914. Wheat flour had declined from \$14 per barrel to \$11.90 in August and \$8.50 in December, potatoes from \$5.50 to \$4, dressed pork and beef from 24 and 25.5 cents per pound, respectively, to 16.5 and 18 cents, butter from 74 to 68 cents, and coffee had fallen slightly, while lemons had fallen from \$6 to \$2 per box. Other commodities showed similar reductions, the only exceptions noted being dried codfish, which had remained stationary in price, and dressed mutton, dried peaches, apples, and raisins for which wholesale quotations were higher than the year before.

Somewhat similar, though less optimistic, findings were reported by the United States Department of Labor. According to the statistics collected by this Department, wholesale prices of commodities were 24 per cent lower in November than at the peak of high prices in May. For the entire year, a drop of 11 per cent in wholesale food prices was recorded, as compared with 28 per cent for clothing and 31 per cent for farm products.

While less comprehensive data as to retail prices were available, indications were that they too were responding, though tardily, to the reductions in wholesale rates. The Department of Labor announced that figures secured in 51 cities showed reductions during the month ended Nov. 15, 1920, in the retail prices of 35 out of 44 articles of food. These reductions included such staple commodities as wheat flour, bread, and other bakery products, corn meal, rice, beans, sugar, pork, and beef, and certain vegetables and canned goods. In amount, however, the reductions were comparatively small, the highest average decrease for any city being that of 5 per cent in Memphis, Tenn. For the entire year, half the foods investigated showed actual increases averaging 1 per cent, making the average annual food expenditure still fully double that in 1913. The ultimate consumer, while beholding a tremendous

shrinkage in the farm value of foodstuffs, was therefore thus far relatively little helped thereby, and was coming to realize anew the wide gap between himself and the producer and the manifold opportunities afforded for speculation and profit-taking on his food supply under prevailing methods of handling and distribution from the farm to his table. More than this, he was also apprehensive of the future, remembering that however welcome might be cheap food, relief from the burden of high prices could not be permanent if obtained by depressing the prices of farm products below the cost of production.

The sugar situation continued to be abnormal and annoying during most of the year. In the hope of overcoming the scarcity of this commodity existing in the fall of 1919, Congress enacted legislation late that year empowering the President to continue the United States Sugar Equalizing Board during 1920 and to take such steps as would secure "an adequate supply and an equitable distribution of sugar at a fair and reasonable price to the people of the United States." Early in January, however, announcement was made that the continuance of this board was impracticable. Soon afterwards a marked increase in prices began, wholesale quotations rising rapidly from 9 cents per pound in December to 22.5 cents in August. Great difficulty was also experienced by consumers in many parts of the country in obtaining adequate supplies, retail sales being quite commonly limited in the larger cities to two pounds at one purchase and retail prices in some cases reaching as high as 30 cents per pound. These conditions led to considerable curtailment in consumption, particularly for home preserving and canning, and caused more or less upsetting of family menus, particularly in the feeding of children.

Suddenly during the fall ample supplies became available, and soon afterward a spectacular reduction in price began. By Dec. 18, 1920, wholesale quotations had dropped below 8 cents per pound and the market was still in an apparently unstable condition. These changed conditions were attributed by the president of the Cuban Cane Sugar Corporation to the "unnecessary" importation of from 350,000 to 400,000 tons of sugar from Java and other distant countries not normally supplying the United States, with a consequent demoralization of the market for the Cuban and domestic supply.

So great was public impatience over the sugar situation that an inquiry by the Federal Trade Commission was directed by Congress. The report rendered by this commission took the ground that "the chief difficulty in the sugar trade, with the government no longer directing distribution, lay in speculation and hoarding," and recommended the continuance as permanent law of portions of the Food Control Act of 1917 prohibiting the hoarding of food and other commodities.

Virtually all the wartime attempts at governmental regulation of the food supply were in abeyance during the year. The United States Grain Corporation ceased its activities May 30, 1920, and trading in futures on the Chicago Board of Trade was resumed soon afterwards. Final action was deferred by Congress on measures to regulate cold storage plants and packing houses. The message of President Wilson of December 7th repeated his recommendation of the previous year for cold storage legislation, and also for the marking of goods destined for inter-

state commerce to show the price at which they left the hands of the producer, no action having been taken on the latter proposal. A bill was passed by the House of Representatives Dec. 8, 1920, prohibiting the use of deceptive and partly-filled containers of food products. Consumers were also directly interested in Federal legislation under consideration at the close of the year to relieve the critical agricultural situation through tariff revision, credit extension, the fostering of coöperative agricultural associations, and other measures discussed elsewhere (see AGRICULTURAL LEGISLATION).

State food legislation was quite limited in amount and scope. Massachusetts and Virginia, however, each adopted comprehensive measures for bakery regulation, looking toward increased sanitation in manufacture and requiring the marking of bread and other products to show their net weight. Massachusetts also prohibited until 1922 so-called combination sales (such as the required purchase of soap or coffee to obtain sugar), gave greater authority to towns and cities in establishing municipal markets, and enacted a new cold-storage law.

FOOD SITUATION ABROAD. While food conditions as a whole showed distinct improvement, the situation was characterized by wide variation in different countries and even in portions of the same country. Heavy exports, particularly of wheat from the United States and Canada, and other causes brought material changes for the better in Great Britain. Food prices reached a maximum in England in the spring of 1920, with a level fully 250 per cent above the pre-war figures. At the close of the year some reductions were being noted, though the trend was slower than in this country.

On the Continent, many discrepancies in both prices and supplies prevailed. Restrictions were gradually being removed in western Europe and Italy, although Switzerland was rationing milk, sugar, and cheese until April, and Belgium sugar in July. In central and eastern Europe the situation was still serious, with many reports of specially deplorable conditions in Poland, Austria, Germany, portions of Russia, and Constantinople. At the close of the year, attempts were being made to raise \$33,000,000 in the United States for the relief of over 3,000,000 children in those countries. Conditions also continued very grave in Armenia and other portions of the Near East, and a new famine centre was reported in China, where unprecedented drought and the approach of winter were imperiling 100,000,000 persons in Shantung and three other northern provinces.

NUTRITION STUDIES. One result of the war was to stimulate interest in scientific investigations relating to nutrition and the world's food supply. Thus in Amsterdam, elaborate buildings were begun during the year for the Netherlands Institute of Animal Nutrition, recently established with private funds and maintained by the government. This institute is to be devoted to comprehensive feeding experiments and other research activities designed to throw light on fundamental nutrition problems. A somewhat similar institute at Aberdeen, Scotland, received a gift of \$50,000 to extend its work. In the United States there was steady progress in developing apparatus and experimental methods, notably in improving the respiration calorimeters and accessory equipment of the United States Department of Agriculture and the Carnegie In-

stitution, the devising of a simplified form of respiration apparatus by the Carnegie Institution and the New Hampshire Experiment Station, and the extension and upbuilding of the experimental kitchen of the Office of Home Economics of the Department of Agriculture.

A number of important statistical and economic studies of the food supply were reported. One of these analyzed the total food production and consumption of the United States, the data indicating that the average daily food consumption per adult man, not corrected for waste, is 120 grams of protein, 169 grams fat, 541 grams carbohydrates, and 4288 calories of energy, as compared with 113 grams of protein, 130 grams fat, 571 grams carbohydrates, and 4009 calories of energy in Great Britain. The chief sources of food were found to be cattle, pigs, and wheat, these supplying collectively 62 per cent of the protein and carbohydrates, 69 per cent of the fat, and 65 per cent of the energy, indicating that in times of national stress these are the important items on which to concentrate attention. The total food supplies of the United States were found, however, to be increasing somewhat more rapidly under present conditions than the population; but considered for a period of years other investigators found this not to be the case.

An elaborate investigation by the Carnegie Institution of human vitality and efficiency under prolonged restricted diet indicated the possibility of conservation in both protein and energy consumption for considerable periods in case of need. On the other hand, observations on food conditions in Germany and elsewhere showed how protracted underfeeding leads to inefficiency in work, apathetic mentality, and diminished resistance to tuberculosis, rickets, and other diseases.

Studies of new or little known foodstuffs indicated the high nutritive value as human foods of soy bean cake and other by-products, potato flour, peanut products, the artificially hardened fats commonly used as lard substitutes, and even whale and shark meat. An interesting conclusion from experiments in which food was rendered unpalatable and consumed in extremely unappetizing surroundings was that such conditions, aside from their undesirability from other standpoints, had very little influence upon the thoroughness of digestion.

Additional evidence was presented of the danger in dietary discussions of regarding food merely as a generic term or even solely as a source of fuel for the body. The essential differences between different foods in nutritive value and adaptability to specific purposes were brought out more clearly than ever before, particularly as regards the wide range in value of their proteins, ash constituents, and the variously termed "accessory substances," "advitants," or "vitamins." This last named group of substances was perhaps more generally studied than any other, notably in its relation to nutritional diseases. A great deal of valuable data was reported along these lines, but the complexity of the problems involved was becoming increasingly evident and their solution admitted to be far from completion.

BOOKS OF THE YEAR. Some of the more important treatises included the following: *The Nation's Food; A Statistical Study of a Physiological and Social Problem*, R. Pearl, Philadelphia and London; *The Feeding of Nations*, E. H. Starling, London; *Food and the Public Health*,

W. G. Savage, New York and London; *Diseases of Nutrition and Infant Feeding*, J. L. Morse and F. B. Talbot, New York.

FOOTBALL. Football which has been steadily increasing in popularity since the world war attained its greatest heights in 1920. Never before did the public rally in such large numbers to the various college gridiron contests, even the smaller institutions being unable to accommodate the hosts that appeared for practically every game.

The clash between Harvard and Yale in the Bowl at New Haven attracted a throng of 80,000 and thousands of applications for seats had to be rejected. The Army-Navy battle at the Polo Grounds, New York City, was witnessed by 45,000 despite the fact that the day on which this classic was staged was far from pleasant. A cold wind swept the field and rain threatened at any moment. The Yale-Princeton clash at Princeton drew 54,000 spectators and the Princeton-Harvard game at Cambridge a like number.

The question as to which was the strongest college eleven in the United States aroused the usual unsatisfactory controversy among the gridiron experts. It was generally conceded, however, that in the East, Princeton deserved the mythical championship title. Ohio State captured the Conference College honors while on the Pacific Coast the University of California team stood out most prominently. The Georgia Institute of Technology showed the way in the South.

A summary of the games played by the leading college elevens follows:

Princeton 17, Swarthmore 6; Princeton 35, Maryland State 0; Princeton 34, Washington and Lee 0; Princeton 14, Navy 0; Princeton 10, West Virginia 3; Princeton 14, Harvard 14; Princeton 20, Yale 0.

Harvard 3, Holy Cross 0; Harvard 41, Maine 0; Harvard 21, Valparaiso 0; Harvard 38, Williams 0; Harvard 31, Centre 14; Harvard 24, Virginia 0; Harvard 14, Princeton 14; Harvard 27, Brown 0; Harvard 9, Yale 0.

Penn State 27, Muhlenberg 7; Penn State 13, Gettysburg 0; Penn State 14, Dartmouth 7; Penn State 41, North Carolina 0; Penn State 109, Lebanon Valley 7; Penn State 28, Pennsylvania 7; Penn State 20, Nebraska 0; Penn State 7, Lehigh 7; Penn State 0, Pittsburgh 0.

Pittsburgh 47, Geneva 0; Pittsburgh 34, West Virginia 13; Pittsburgh 7, Syracuse 7; Pittsburgh 10, Georgia Tech. 3; Pittsburgh 14, Lafayette 0; Pittsburgh 27, Pennsylvania 21; Pittsburgh 7, Washington and Jefferson 0; Pittsburgh 0, Penn State 0.

Boston College 20, Fordham 0; Boston College 21, Yale 13; Boston College 12, Springfield 0; Boston College 34, Boston University 0; Boston College 37, Tufts 0; Boston College 13, Marietta 3; Boston College 30, Georgetown 0.

Dartmouth 31, Norwich 0; Dartmouth 7, Penn State 14; Dartmouth 27, Holy Cross 14; Dartmouth 0, Syracuse 10; Dartmouth 34, Tufts 7; Dartmouth 14, Cornell 3; Dartmouth 44, Pennsylvania 7; Dartmouth 14, Brown 6; Dartmouth 28, University of Washington 7.

Syracuse 55, Hobart 7; Syracuse 49, Vermont 0; Syracuse 45, Johns Hopkins 0; Syracuse 7,

Pittsburgh 7; Syracuse 10, Dartmouth 0; Syracuse 0, Holy Cross 3; Syracuse 14, Washington and Jefferson 0; Syracuse 7, Maryland State 10; Syracuse 14, Colgate 0.

Yale 41, Cranegie Tech. 0; Yale 21, University of North Carolina 0; Yale 13, Boston College 21; Yale 24, West Virginia 0; Yale 21, Colgate 7; Yale 14, Brown 10; Yale 0, Princeton 20; Yale 0, Harvard 9.

Navy 7, North Carolina State 14; Navy 12, Lafayette 7; Navy 7, Bucknell 2; Navy 0, Princeton 14; Navy 47, Western Reserve 0; Navy 21, Georgetown 6; Navy 63, South Carolina 0; Navy 7, Army 0.

Army 36, Union 0; Army 38, Marshall 0; Army 27, Middlebury 0; Army 26, Springfield 7; Army 21, Tufts 6; Army 17, Notre Dame 27; Army 53, Lebanon Valley 0; Army 90, Bowdoin 0; Army 0, Navy 7.

Georgia Tech. 44, Wake Forest 0; Georgia Tech. 66, Davidson 0; Georgia Tech. 55, Oglethorpe 0; Georgia Tech. 44, Vanderbilt 0; Georgia Tech. 3, Pittsburgh 10; Georgia Tech. 24, Centre 0; Georgia Tech. 7, Clemson 0; Georgia Tech. 35, Georgetown 6; Georgia Tech. 34, Alabama Tech. 0.

Soccer thrived during 1920, the feature of the year being the trip to Sweden made by the St. Louis All-American team. The Americans won 7 games, drew 5, and lost 2. The only defeats were at the hands of the All-Sweden Olympic team and the All-Stockholm eleven.

The National Challenge Trophy was captured by a Western team for the first time, the victor being the Ben Miller A. C. of St. Louis which defeated the Fore River F. C. of Quincy, Mass., in the final round by 2 goals to 1. The Robins Dry Dock team of Brooklyn had in the meantime eliminated the Bethlehem Steel Corporation eleven which had so long held the national title. The Robins added to their laurels by winning the American Football Association Cup and the Southern New York State Football Association Trophy.

The University of Pennsylvania eleven once more carried off the intercollegiate championship but only after a bitter struggle with Princeton which necessitated two extra games being played.

FORDHAM UNIVERSITY. A Roman Catholic University, at Fordham, N. Y., founded in 1841. The number of students in 1920 was 2300 and the number of members in the faculty was 250. President, Rev. E. P. Tivnan.

FOREST FIRES. See **FORESTRY.**

FORESTRY. The forest fire situation in 1920 was less disastrous than for several years past, though the spring fire season in the Southwest taxed the energies of the protective force to hold the fires in check. In California the season opened extremely hot and dry, with early June fires in Sierras. By the middle of July an acutely hazardous condition had developed in the Northwest, but the fires were held well in hand until about August, when dry electrical

storms began to start an extraordinary number of fires, chiefly in the high mountains where they are most difficult to get at quickly. Fortunately the fall rains set in early—before the end of August—so that the acute period was relatively brief. The expenditure for fire fighting was approximately \$800,000 as compared with \$3,039,615 in the calendar year 1919 when over 2,007,034 acres of National Forest lands were burned over, with an estimated damage of \$4,919,769.

Canada had about 5000 fires between April and September, 1920, with loss of life in Northern Manitoba and serious loss of property in many sections of the country, notably the burning of St. Quentin, New Brunswick. One big blaze caused by lightning cleaned out 15 square miles in a single section of Quebec. Two forest fires of special violence in Ontario occurred at Ostrom and at Makwa where 25,000 and 12,000 acres respectively were burned over.

THE DECLINING TIMBER SUPPLY. Discussion of the critical forest situation in the country and methods of meeting it occupied an important place, both in the forest literature of the year and in gatherings of forest associations and various organizations of the industries dependent on forests for raw material. Although much difference of opinion existed as to the exact relations of the Federal and State governments and land owners in the future forest policy of the nation, there was practically unanimity of agreement that the first and most essential step is nation-wide protection from forest fires, applicable to all classes of forest land and borne jointly by the land-owners and the public.

On September 28th, representatives of State forest organizations, the United States Forest Service, private forestry associations and educational institutions met at Albany, N. Y., and organized a "National Committee of Forest Fire Prevention." It was the sentiment of the meeting that the committee should organize with representatives from various States in order to take common counsel and to bring pressure to bear for the enactment of both Federal and State legislation along the lines of fire protection. On the same date a "Council of Wood-Using Industries" was organized in Chicago. The newly formed council has two primary objects in view. These are: to perpetuate the forests of the country through fire protection and improved methods of forest management, and to promote the more efficient and economical use of forest products.

The crucial character of the forest situation of the country was made more clear than ever before by the results of a study made in the latter part of the year by the Forest Service, in response to a Senate resolution. The results of this study were embodied in a report entitled "Timber Depletion, Lumber Prices, Lumber Exports, and Concentration of Timber Ownership," submitted to the Senate on June 1. It was found that over two-thirds of the original forests of the United States have been culled, cut over, or burnt, and three-fifths of their merchantable timber is gone. The country is taking about 26,000,000,000 cubic feet of wood annually from its forests and is growing but 6,000,000,000 feet. It is cutting timber of every class, even trees too small for the sawmill, much faster than they are being replaced in the forests. The fundamental cause for the present shortage of newsprint paper is ascribed to the serious depletion of the forests in the Northeastern and Lake States where there

is an over development of the pulp and paper industries. Sixty-one per cent of what timber is left lies west of the Great Plains, far from the bulk of our population, agriculture, and manufacture.

The exhaustion of one forested region after another in the Eastern States it is shown has been reflected in rising transportation costs, in shortages of supply resulting from the overloading of transport facilities, and in a narrowing field of competition between regional groups of sawmills. The distance between the average sawmill and the average home builder is steadily increasing; and we shall soon be dependent for the bulk of our construction lumber upon the forests of the Pacific Coast. These conditions have had a vital bearing upon the high cost of lumber, which, during the year, reached a prohibitive figure for many uses and checked the building of homes which is so urgently needed. At the bottom of the whole problem is placed the idle forest land. The United States contains 326,000,000 acres of cut-over or denuded forests containing no saw timber: 81,000,000 acres of this amount have been completely devastated by forest fires and methods of cutting which destroy or prevent new timber growth. The area of idle or largely idle land is being increased by from 3,000,000 to 4,000,000 acres annually as the cutting and burning of forests continue.

In his annual report United States Forester William B. Greely concludes that to stop the devastation of our remaining forests and put our idle forest lands at work the first step must be the enactment of a Federal law whose chief provisions are (1) a comprehensive plan of Federal coöperation with the States in fire prevention and the development of forest practice, and (2) extension of the National Forests through purchases along the line initiated by the Weeks Act, through the inclusion of other timberlands now in Federal ownership, and through exchange.

CONFERENCE IN LONDON. The British Empire Forestry Conference held in London in July constituted a notable event for foresters and others interested in forest conservation throughout the world. The conference was made up of 35 delegates from all parts of the Empire. Each of the governments included was urged to lay down a definite forest policy to be administered by a properly constituted and adequate forest service. This policy should aim at securing a sustained yield from all classes of timber; encouraging the most economical utilization of wood and other forest products, and maintaining and improving climatic conditions in the interests of agriculture and water supply. The conference formed an Empire Forest Association, the specific purpose of which will be "to promote and develop public interest in forestry throughout the Empire." The headquarters of the society will be in London and membership will be open to organizations, firms, and individuals interested in forestry or the commercial utilization of timber and other forest products.

NATIONAL FORESTS. The net area of the National Forests on June 30, 1920, was 156,032,053 acres as compared with 153,933,700 acres June 30, 1919. The apparent net increase of 2,098,353 acres includes 654,942 acres previously purchased under the act of March 1, 1911, but not given the formal status of National Forests until proclaimed as such during the past fiscal year. The actual net increase of 1,443,651 acres

is due principally to the addition by act of Congress of about 1,000,000 acres, embraced in the Thunder Mountain region in Idaho, to the Idaho and Payette National Forests. Special acts of Congress made small additions to five other National Forests, while Presidential proclamation added 130,355 acres to the Coconino and Prescott National Forests, for the protection of important reclamation projects on the Verde River. Certain small additions and eliminations due to land exchanges were also made.

Owing to the virtual exhaustion of the appropriation for National Forests in the East, little progress was made in acquiring new lands in the White Mountains and southern Appalachians. At the close of the year 1,420,208 acres had been purchased in these regions. In addition 12,094 acres were purchased in the Ozark Mountains in Arkansas. All purchased lands have now been proclaimed and organized as National Forests.

The total receipts from the National Forests for the year ending June 30, 1920, were \$4,793,482, an increase over 1919 of \$435,067. Although the total expenditures of Forest Service appropriation were \$5,966,869, the receipts exceed by \$78,000 the cost of protection and administration on the National Forests, exclusive of emergency fire expenditures, the construction of improvements, and special development and research projects.

FOREST PRODUCTS LABORATORY. The year marked the completion of 10 years of research by the Forest Products Laboratory at Madison, Wis. Its work, at first little appreciated, is now generally recognized both in this country and abroad as of immense value to science and industry. In all, the investigations of the Laboratory have cost about \$2,000,000 and are believed to be now saving industry at least \$30,000,000 annually. The laboratory will make investigations connected in one way or another with the national defense a part of its regular program, in cooperation with the War and Navy Departments. New projects started include the design of various types of airplane struts and the development of a plywood airplane wing. Extensive tests were made on white ash and other species to determine the effect of spiral grain and of various other defects and blemishes on strength. In addition to specific designs, the closer utilization of existing supplies of aircraft woods was investigated and types of built-up beams were developed. Knowledge of the mechanical properties of wood was extended through 62,000 tests, covering 57 different species. The total number of such tests made by the Laboratory is now 500,000.

Among the subjects of investigation were the effect of commercial processes of wood preservation on the strength of structural timber, the toughness and shearing strength of various kinds of plywood, its bolt bearing and screw-fastening properties, and the impairment of strength of wood under continuous vibration. The services of the box-testing laboratory were extensively used by manufacturers and shippers. A 40-page catalogue of service tests of railroad ties, covering all installations on which the laboratory is keeping inspection records, was completed and printed in the 1920 proceedings of the American Wood Preservers' Association.

Wood distillation studies have shown that the addition of a small amount of sodium carbonate increases the yield of wood alcohol by from 50

to 60 per cent without seriously affecting the yields of the other valuable products. The method is effective, however, only when the material for distillation is in the form of small pieces of wood or sawdust briquettes. Forest Service water spray kilns have proved so satisfactory in actual operation that they have been installed or are being built not only in the United States but in India, Australia, New Zealand, and Mexico. Work on the production of book and similar papers from cotton linters was continued, and mill tests have demonstrated that a very high grade of paper can be made. Two large companies are now erecting plants for the manufacture of paper from this material, basing their plans largely on the experimental work conducted by the laboratory. Practical courses in kiln-drying, glue work, and boxing and crating have been developed to meet these requests more effectively. These courses, largely attended by factory superintendents, have proved one of the most satisfactory means of getting the results of the laboratory into actual use.

INSTITUTIONS, PERSONNEL, ETC. In recognition of his services to the Dominion and the University of Toronto for the last 12 years the university conferred the degree of Doctor of Laws on Prof. Emeritus B. E. Fernow. On March 14, Colonel W. B. Greeley was appointed Chief Forester of the United States to succeed Colonel Henry S. Graves, resigned. Franklin Moon was elected Dean of the New York State College of Forestry.

The University of Nanking has established a business for the sale of Chinese tree seeds, with an agent in New York City. The profits from the business are all devoted to the furthering of forestry in China. According to John H. Reiser, Dean of the College of Agriculture and Forestry of the University, the best evidence that interest in practical forestry is increasing in China is the large number of tree planting operations being made by individuals, organizations, and lesser governmental divisions. Thus far the Central Government has taken practically no part in the work of reforestation. The largest single item in Finland's 1920 Agricultural Budget is that of forestry, being estimated at 8,800,000 marks, or nearly 13 per cent of the total. Among recent developments in the Balkan region of Europe may be mentioned the establishment of provincial offices for forests and agricultural administration in Jugo Slavia, a new forestry association in Bosnia-Herzegovina, and the establishment of a forest school in Sarajevo, offering a two-year course.

Plans of the Pennsylvania State Forestry Department for extensive reforestation in the woods and the waste lands of the State called for the largest amounts of seed ever used, and efforts were being made to secure a large supply of seed from indigenous trees. While most of the planting will be made on State and private timberland, shade trees will also be grown for free distribution to cities and boroughs for municipal and educational plantings.

See AGRICULTURE.

FORMOSA, or TAIWAN. An island belonging to Japan, situated off the coast of the Chinese province of Fukien. Capital, Dai-hoku (or Taipei). Area, 13,839 square miles; population estimated in 1918, 3,698,918 (1,919,701 males and 1,779,217 females). The population of Dai-hoku was 102,249. Other towns are Tainan, Kagi, and Taichu. The chief agricultural product is rice, and among the others are sugar cane, tea, sweet potatoes, jute, ramie, and turmeric. Camphor, which is a government monopoly, is produced in the forests. In 1918-19, the production was about 6,000,000 pounds, which was less than 50 per cent of the production of the year before. Among other industries are fisheries, sugar manufacture, flour-milling, and the manufacture of tobacco, oil, spirits, iron work, glass, bricks, soap, etc. Livestock is raised to a considerable extent. Latterly mining has developed, and in 1918, the production of coal reached 801,520 tons. The commerce is largely with Japan, and in trade with foreign countries, China and the United States take the lead. In 1918 the imports amounted to 104,145,875 yen; exports, 155,626,870 yen. The chief exports in 1918, were: Tea, 8,587,148 yen; sugar, 6,223,243 yen; camphor, 2,942,011; coal, 2,893,754. The chief imports were rice, opium, oil-cake, beans, and tea-seed. The revenue and expenditure for 1919-20 balanced at 70,305,452 yen. The main items of expenditure were communications and public works, and the main sources of revenue were government enterprises. The local finances receive annual subsidies from Japan, ranging from 5,000,000 to 9,000,000 yen. In 1917-18, there were 318 miles of government railway open for traffic, and over 974 miles of private railway. Post offices in 1918 numbered 166, and telegraphs had a mileage of 606.

China ceded the island to Japan, May 8, 1895, and Japanese civil government was established there, March 31, 1896. In 1909, the Japanese undertook a plan for colonization and a number of Japanese villages grew up which in 1916 had a population estimated at 3268. The island is under a Japanese governor-general.

FORT, JOHN FRANKLIN. Former Governor of New Jersey, died at South Orange, N. J., November 17. His health had been failing since April, 1919, and had caused his resignation from

the Federal Trade Commission a year before his death. He was born at Pemberton, N. J., March, 1852, and studied law at the Albany Law School, being admitted to the bar in 1873. He was judge of the District Court of Newark, 1878-86, and justice of the Supreme Court of the State, 1900-7. From 1908-1911, he was governor of New Jersey. In 1914, he was sent by the United States as special envoy to the Dominican Republic and in 1915 to Haiti. For many years he was prominent in the Republican politics of his State and he was several times a delegate to National Conventions. After his election to the governorship of New Jersey, he declared his independence of boss rule and for the adoption of the "new idea" in politics. His administration was marked by his firmness on the excise questions. He had previously shown vigor in enforcing the laws against gambling when he was justice of the Supreme Court.

FORTY-EIGHT, COMMITTEE OF. This Committee was reorganized after the election of 1920.

Its purposes, however, remain very similar. The platform is as follows: "Our purpose is the abolition of privilege, meaning by privilege the unjust economic advantage by possession of which a small group controls our natural resources, transportation, industry, and credit, stifles competition, prevents equal opportunity of development for all, and thus dictates conditions under which we live. To accomplish this we advocate: (1) Public control of natural resources by taxation of all land values, including land containing coal, oil, natural gas, mineral deposits, large water powers, and large commercial timber tracts, in order to prevent monopoly and speculation, to aid industry, and to force idle lands into use. (2) Public ownership of railroads, canals, and pipe-lines, including all necessary distributing and terminal facilities and all necessary means of communication, in order to give the same service to all users. (3) Equal rights, economic, legal and political for all citizens, and all Civil Rights, including Free Speech, Free Press, and Peaceable Assembly, as guaranteed by the Constitution."

The following is quoted from a report of the Executive Committee: "The crux of the situation lies in the control of our natural resources, and transportation system, by a small group of financiers, who by reason of their control reach into every phase of our daily life and dictate our living conditions. Through their ability to control the sources of our supplies they dictate the quantity of production and regulate the prices of practically everything we eat, wear, and consume. Through their control of transportation and the channels of distribution they stifle competition, inflate costs and create monopolies whose success is in exact proportion to their ability to eliminate independent competitors from entering the same field of industry. Thousands of acres of coal lands have been acquired and are being held out of use in order that through a limited production exorbitant prices may be established and maintained. Large areas of ore lands are owned and similarly kept idle so that independent competitors in the steel industry may be barred from access to the natural and necessary sources of supply. Our agricultural food supply—often over-produced by the ever-hopeful farmer—frequently rots on the ground because through the same control, its distribution to the waiting consumer is choked

off, so that the meagre proportion that leaks through will not endanger prices and 'break the market.' Our beef, lard, butter, eggs, leather, and the multitudinous by-products connected with the packing house industry through advantages extended to the packers in transportation, deliveries have been monopolized, which means that a large share of our population is denied food products essential to their health. These financiers for more than a generation have likewise controlled the machinery of both the Democratic and Republican parties and have thus frustrated every attempt of the people to destroy these special privileges, which are the source of their power. It is essential to focus our program upon the abolition of these special privileges, upon the removal of these artificial economic advantages through which this financial control operates, and produces the existing conditions herein described. To accomplish this, and thus open the way to an equal opportunity of development for all we advocate, Government Ownership of railroads, government control of natural resources, the recognition of equal economic legal and political rights for all, the abolition of government by injunction, and the recognition of labor's right to organize and bargain with its employers upon an equal basis, through representatives of its own choosing. Such a program strikes at the root of the evils which are responsible for the critical situation we are facing to-day. It will directly or indirectly benefit all except those who are affiliated with the small group who now hold the prosperity of our country in the hollow of its hands, and are using its control for selfish purposes, inconsistent with and highly dangerous to the public welfare. And it will merit the support of all voters, who as citizens and consumers are now feeling the increasing pressure of high prices and scant production." Chairman of the Executive Committee, J. A. H. Hopkins; Secretary, Allen McCurdy; headquarters, at 15 East 40th Street, New York City.

FRANCE. A European republic constituting the westernmost state of central Europe, between 42° 20' and 51° 5', N. latitude, and 7° 45' E. and 4° 45' W. longitude, separated from England by the Channel and the Straits of Dover; area before the war, 207,054 square miles; divided for administrative purpose into 87 departments, including the island of Corsica, but not including Alsace-Lorraine, which was reincorporated in the French administrative system after the war. See below and also under ALSACE-LORRAINE.

POPULATION. According to the census of 1911, the population was 39,602,258, an increase of about 350,000 since 1906. For details of population by departments, and chief cities, and for vital statistics according to the census of 1911, see preceding YEAR BOOKS. Capital, Paris, with a population before the war of 2,888,110.

The return of Alsace-Lorraine added 5605 square miles to the above area, and a population, according to the census of 1910 of 1,874,014; thus bringing the total area of France to 212,659 square miles and the total population to 41,475,523. The three former divisions of Alsace-Lorraine, namely, Lower Alsace, Upper Alsace, and Lorraine, were formed into the departments of Bas Rhin with an area of 1848 square miles and a population of 700,938; Haut Rhin, with an area of 1354 square miles and a population of 517,865; and Moselle, with an area of 2403 square miles and a population of 655,211.

By article 45 of the Treaty with Germany, France secured the exclusive rights of exploiting the coal rights of the Saar Basin, which has an area of about 220 square miles and a population (pre-war figures), of 640,733, and for the next 15 years this region was to be under a commission of five, chosen by the League of Nations. At the expiration of that period, the population was to decide whether it would remain with France, return to Germany, or continue under the rule arranged by the Treaty. See the article WAR OF THE NATIONS.

The question of repopulation which had always been serious was renewed with especial anxiety after the war and the discussion of it continued throughout 1920. Between the censuses of 1901 and 1906, there had been an increase of only 1.4 per cent and between those of 1906 and 1911 of 1.7 per cent. From 1914 to 1918 inclusive, there had been a heavy excess of deaths over births, rising from 53,327 in 1914 to 267,640 in 1915 and 389,575 in 1918. Marriages in 1917 numbered 158,508 and in 1918, 177,822. In 1913, the average birth rate was 1.88 per cent of the population, and in 1918, 1 per cent. During the war, about 1,500,000 had been killed to say nothing of losses and the indirect losses, and the vast numbers incapacitated as the result of wounds or disease. In the 12 months succeeding the armistice the registered births numbered 403,502, and the deaths, 620,000. This was attributed largely to the high cost of living, the shortage of houses, and the tendency to crowd into the cities, especially Paris. In the course of the year 1920 statistics, however incomplete, that seemed to afford any clue to the subject were eagerly published by the press. The following item appeared early in November. The department of the Eure had for 10 years showed an excess of deaths over births. Added to this the war had so reduced the number of young men in the country districts that manual labor became extensively scarce and this was especially serious as the department was essentially agricultural and stood at the head of all departments in respect to wheat production. During the past six months of 1920 the figure for births was 3556 and of deaths 3293 including 185 stillborn. Thus, a small excess on the right side of the account had appeared. In certain districts, a considerable percentage of excess was reported.

Preliminary figures applying for the first time to all the 90 departments, including the 10 departments that had been invaded and the three departments of Alsace-Lorraine, showed a decided improvement. Births exceeded deaths by 67,946, whereas during the first half of the year 1919 (figures for the 77 departments, not including the invaded departments and Alsace-Lorraine) deaths exceeded births by 192,052.

EDUCATION. Primary education is free and compulsory for all children between the ages of six and 13. In 1917-18 the schools of France and Algeria numbered 48,485 with 70,581 teachers and 3,034,913 pupils. Secondary instruction is supplied by lycées maintained by the state and colleges maintained by the communes; free schools are established by private persons and associations. The public secondary institutions in France and Algeria, in 1915 comprised 104 lycées with 53,028 pupils and 211 communal colleges with 28,608 pupils; at the end of 1917, the number of pupils was respectively, 59,128 and

31,418. There were in addition 174 public secondary institutions for girls with 35,736 (1916). Higher education is supplied by the state universities and by special schools directed by the state; also by various private faculties and schools.

Year	Horses	Mules	Asses
1919	2,413,190	167,180	303,100
1918	2,232,930	139,070	311,890
1917	2,303,400	143,990	318,960
1916	2,245,630	147,630	326,570
1915	2,209,190	145,840	322,570
1914	2,205,190	151,710	336,710

The universities number 16 and are situated at the following places: Paris, Strasburg, Lyons, Bordeaux, Toulouse, Grenoble, Montpellier, Aix-en-Provence, Rennes, Poitiers, Nancy, Caen, Dijon, Lille, Clermont-Ferrand, and Besançon. Of these, the largest is the university at Paris, with 6025 students, in 1917. The next in numerical importance are Strasburg, Lyons, and Bordeaux. The number of students in the faculties of law, medicine, science, and letters in 1917 was 14,121 of whom the sciences were the most numerous attended (3585), while the law faculty came next (3566). Besides the above there are various higher institutions depending on public instruction, including the Collège de France; the Museum of Natural History, which gives instruction in sciences; the Practical School of Higher Studies, with its seat at the Sorbonne, giving instruction in history, philology, mathematics, sciences, etc.; the superior normal school; the Ecole des Beaux Arts, etc. There are also numerous and diverse institutions of higher or technical instruction, which depend on other ministries, including schools of commerce, agriculture, military science, mines, etc.; and there are a large number of technical schools of lower grade, which depend on the Ministry of Commerce.

AGRICULTURE. The area and production of the principal crops in 1919, according to provisional figures are as follows:

Crop	Area (1000 acres)		Produce (1000 metric tons)	
	1919	1918	1919	1918
Wheat	11,582	11,582	4,844	4,844
Mixed corn	228	228	93	93
Rye	1,837	1,837	707	707
Barley	1,375	1,375	514	514
Oats	6,980	6,980	2,448	2,448
Potatoes	3,175	3,175	7,763	7,763
Root, sugar				
Tobacco				

The following table shows the official figures (revised) for the cereal and potato crops of 1919 and 1918 compared with those of 1914, in quintals:

	1919	1918	1914
Wheat	49,653,700	61,453,840	76,936,060
Mixed grain	967,940	959,820	1,253,550
Rye	7,299,370	7,349,860	11,147,140
Barley	4,999,840	5,982,000	9,758,150
Buckwheat	2,719,690	2,241,800	5,324,010
Oats	24,935,840	25,619,760	46,206,840
Corn	2,534,110	2,478,070	5,722,940
Potatoes	77,305,620	65,197,220	119,927,130

The wide difference between the production as shown in the above figures was being rapidly reduced in 1920 and there was promise of an early return to the level of pre-war production. According to the customs returns, the wine production for 1919 was 1,132,161,000 gallons, as compared with 929,810,000 gallons in 1918. The cider production in 1919 was 479,179,000 gallons. The French Ministry of Agriculture pub-

lished in the *Journal Officiel* of July 21, 1920, the following statistics of the number of farm animals in France on Dec. 31, 1919, as compared with the numbers existing on December 31 of the five previous years:

Oxen and cows	Sheep	Swine	Goats
12,373,660	8,990,990	4,080,560	1,166,770
12,250,820	9,061,110	3,080,020	1,197,490
12,241,980	9,881,870	4,165,400	1,160,990
12,341,950	10,845,280	4,361,900	1,176,510
12,520,110	12,261,780	4,909,890	1,231,330
12,668,240	14,038,860	5,926,290	1,308,150

The French Ministry of Agriculture published in the *Journal Officiel* at the close of the year, the following approximate figures for the French crops of certain classes of agricultural produce in metric tons at 2204.6 pounds:

Crops	Metric tons
Corn	426,567
Millet	14,276
Buckwheat	362,911
Potatoes	10,315,590
Jerusalem artichokes	1,343,725
Turnips	2,200,575
Cabbage	5,282,223
Beets:	
Sugar	2,055,614
Distillery	461,520
Forage	15,601,539
Flax:	
Straw	37,641
Seed	11,320
Hemp:	
Straw	13,251
Seed	5,120
Hops	1,017
Tobacco	13,193
Lentils	8,961
Peas	12,158
Beans, broad	61,588
Beans, n. e. s.	100,590
Apples and pears for cider making	1,254,953

The increase shown in the number of horses and mules for 1919 was due to heavy importations for the purposes of the war, the figures for 1919 including the horses and mules disposed of in France by the British army.

The enormous increase in wages, and the price of agricultural implements, fertilizers, and other necessities in agricultural production are illustrated by the following comparison of pre-war prices with that of 1920: Nitrate of soda had risen from 25 francs per 100 kilograms to 150; plows (per kilogram) from one-half franc to 4½ francs; harvesters from 900 francs apiece to 4500; yearly wages of carters (with food and lodging) from 600 francs to 3500 francs; shepherds, 500 to 3000; cowherds, 400 to 2400; servants, 240 to 1600; wages per day of ordinary workmen, from four francs to 15 francs. The change in the price of farm animals as shown in the following table, caused great uncertainty in respect to returns, since reduction of prices was inevitable and the farmer constrained to purchase or retain live stock could form no estimate of its future value:

	Pre-war Francs	In 1920 Francs
Horses	1,200	5,500
Oxen	800	5,000
Milch cows	550	4,000
Sheep	30	240
Sucking pigs	30	250

COAL PRODUCTION. In an address by the finance minister at Strasburg, October 20, it was pointed out that the total production of combustible minerals in 1913 had been 40,844,218 tons; in the first eight months of 1920, it had been 15,612,408 tons which included the exploitation of the Alsace-Lorraine mineral deposits. Thus, a production of 24,000,000 tons for the current

year was indicated. In 1913, the mines destroyed during the war had supplied 20,000,000 of the above figure for that year. In the first eight months of 1920, these mines had supplied something over 2,000,000,000 tons. In respect to coal, the following information is supplied by the United States Bureau of Foreign and Domestic Commerce, based on the investigations of M. Eduard Payen for *L'Economist Français*:

Contrary to the natural expectation that the output of coal in France would increase considerably on the cessation of hostilities the figures for the production in 1919, showed a marked decline in the industry. From 29,311,000 tons in 1918 the national output fell to 22,341,864 tons in 1919, and of that total the newly acquired Lorraine mines accounted for 2,375,000 tons. Ignoring the amount supplied by Lorraine, the figures for the years just previous to and during the war follow:

Year	Tons	Year	Tons
1910	38,350,000	1915	19,908,000
1911	39,230,000	1916	21,477,000
1912	41,145,000	1917	28,940,000
1913	40,844,000	1918	29,311,000
1914	29,786,000	1919	19,966,000

Thus when the amount contributed by Lorraine was deducted from the figures for 1919, the total was but little above that of 1915, the first calendar year of the war. As to the causes, the following points were brought out: The demobilization and peace were responsible for the reduction in the effective employees at the mines. Almost immediately the mines lost, first, the prisoners of war, numbering around 18,000; second, among the mobilized workers, those who had looked only for temporary quarters; and lastly, those from the devastated areas who lost no time in returning there. The number of miners employed in the coal fields of France, who totaled 207,000 on Dec. 31, 1918, fell by July 1, 1919, to 163,000. After that they were slightly augmented, owing largely to better wages and the termination of certain other war industries. The Commission of Mines arranged with the Italian Director of Emigration for the allotment of 7000 Italian laborers to work in the French mines. Furthermore, through the efforts of the Director of Mines and the Department of Labor, there was assured to the mines a force of Polish workers recruited by that government. The total number of laborers in the coal mines of France on Dec. 31, 1919, was 188,000, that figure taking in the 10,177 workers in the Lorraine fields. To this diminution in the number of laborers is to be added a reduction in the individual daily output which became more marked every month. In 1913, the last normal year, the individual yield averaged 3074 kilos a day; during the last few months of 1919 it fell to 2617 kilos. Other influences continued practically the same as in 1918. A dearth of transports, which burdened the coal-mining industry as all others, shortage and delay of freight cars, and insufficiency of mining apparatus all worked to check the total production. Importation from England and the United States was retarded by an exchange almost prohibitive. When there was need of materials the exploiter encountered a double uncertainty, delay and price fluctuation, neither of which was offset by any guarantee on the part of the selling agent. Under such conditions the output of 1919 was very discouraging. But it must be noted that it was found impossible to obtain

from Germany the supply as stipulated in the treaty of peace. In place of the 14,000,000 tons which were promised for the second half of 1919, only 1,100,000 tons were furnished. The Saar furnished 2,305,000 tons and Belgium 1,900,000 tons. The remainder was obtained from England, whose shipments increased to 16,700,000 tons.

In the month of October, the deliveries of German coal continued to improve as the result of the Spa agreement. They amounted during the month to 2,186,968 tons, of which France received 1,520,334, the rest being distributed among Italy, Belgium, and Luxemburg. In November the French were purchasing American coal at a considerable rate, the amount taken in that month being 700,000 tons, at a price of about \$15 a ton. At the end of the month the chief of the Bureau of Coal Purchases declared that France could not pay the price to Great Britain agreed upon in the arrangement of 1920, and unless the British government could make better terms France would have to purchase from the United States which offered not only a lower price, but long term credit. See PETROLEUM.

INDUSTRIAL LOSSES. In the following table the number of industrial establishments affected, employing at least 20 persons, is contrasted for the different Departments, together with the number and percentage of those that had resumed business by May 1, 1920:

Department	Number of establishments included in official census	Number of establishments where business is resumed	Proportion of establishments in which business is resumed
Nord	1,931	1,508	78.09
Ardennes	396	294	74.20
Aisne	833	215	64.50
Somme	256	151	63.90
Pas-de-Calais	166	117	70.40
Meurthe-et-Moselle	158	127	80.30
Oise	104	90	86.50
Marne	82	57	69.50
Meuse	55	33	60.00
Vosges	47	35	74.40
Total	3,508	2,627	74.80

The losses in the Nord were easily the heaviest, and fortunately the work of reconstruction was there well advanced. In general, practically three-fourths of the industrial group had resumed operations, but very few concerns were able to transact business on the pre-war scale.

DEVASTATED REGIONS. In respect to the metal-working industries, France held the fourth place in 1913 in the production of cast-iron and the fifth place in the production of steel. At the time of the armistice these industries which had been ruined during the war practically had ceased to exist. In September, 1920, however, it was reported that 33 blast furnaces were in operation in the region of Longwy, Briey, and Nancy, and that five were ready to function and 27 in process of construction. The same progress was indicated in several other industries. In spinning and weaving, for example, the east of France employed in 1913, some 15,000 working men distributed among 30 plants. In the autumn of 1920, the production had attained about one-fourth of its former quantity and it was believed that within six months it would reach 60 per cent of its pre-war capacity. Satisfactory results were also reported for the manu-

facture of building material. For example, the brickyards of Pont-à-Mousson, which turned out 20,000,000 bricks in 1914 had reached 50 per cent of the output in the autumn of 1920. The factories of Longwy were reported to have attained three-fourths of their pre-war output; at other points from one-half to nearly the whole of pre-war capacity was reported to have been attained. Figures published in the autumn of 1920 showed the production of bricks to be 35 per cent of the pre-war output; tile 50 per cent; cement 90 per cent.

In his address of October 20, at Strasburg, the finance minister gave some figures in regard to the reconstruction of the invaded regions. He said that 77 per cent of the industrial plants which had been pillaged or destroyed had either completely or partly resumed operation and that their personnel had now risen to 42 per cent of the force employed before the war. Out of 1,757,000 hectares of cultivable land 66 per cent had been tilled and 50 per cent sown despite the fact that 1,521,000 hectares of the total had been ravaged. The agricultural returns had surpassed all hopes. The 10 departments had given 10,000,000 quintals of wheat or a sixth of the total production of France. Oats yielded one-quarter of the production. Everywhere the work of restoration was rapidly going on. The mines were being pumped out and the railways improved. Out of 3000 kilometres of destroyed line there were only nine kilometres to rebuild. The peasants had shown remarkable energy in bringing back the soil to cultivation. The Department of the Meuse, where the long and destructive campaign of Verdun had taken place and where two years before great stretches of barren land were to be seen, promised now to supply more grain than was necessary for its inhabitants and to have a considerable excess for exportation. Out of the 300,000 houses completely destroyed, a large number had been rapidly rebuilt and others were in process of construction,

a general strike which was said to have caused the partial loss of employment of about 140,000 persons. Figures for the department of the Nord showed a falling off of 20 per cent of operating time in the woollen, cotton, linen, lace, clothing, and related industries. This was due to the enormous fall in price. The retail stores being almost completely stocked and buying being slow, there were few sales among the wholesalers. The same condition in fact prevailed as in many parts of the United States, but the situation was reported to be extraordinarily acute.

COMMERCE, ETC., 1919 AND 1920. The following information in respect to foreign trade of France for the year 1919, is supplied by the United States Bureau of Foreign and Domestic Commerce in 1920: In 1919 the foreign trade of France, exclusive of gold and silver, coin, bullion, and baser coinage, was valued at 38,491,687,000 francs or \$5,272,833,835 (at 7.30 francs to the dollar) as compared with 27,024,078,000 francs or \$4,825,728,214 (at 5.60 francs to the dollar) for 1918, and 15,301,549,000 francs or \$2,953,198,957 (at 5.18 francs to the dollar) for 1913. The value of imports amounted to 29,778,519,000 francs (\$4,079,249,178) as against 22,301,384,000 francs (\$3,982,390,000) in 1918, and 8,421,332,000 francs (\$1,625,317,076) in 1913; and the value of exports was 8,713,168,000 francs (\$1,193,584,657), in 1919, 4,722,694,000 francs (\$843,338,214) in 1918, and 6,880,217,000 francs (\$1,327,881,881) in 1913. Imports of gold, silver, bullion, and the baser coins in 1919 amounted to 111,289,000 francs (\$21,478,775) as compared with 69,723,000 francs (\$13,456,539) in 1918 and with 974,980,000 francs (\$188,171,140) in 1913, and the values of exports during 1919, 1918, and 1913, by principal groups and exclusive of specie, bullion, and the baser coinage:

the quick industrial recovery in the devastated regions, there were signs toward the end of the year that much damage was being done to industry by strikes. In the region of Lille, the textile industry was seriously embarrassed by

Preliminary figures for the foreign trade of the entire year 1920 were as follows: Total exports, 22,434,757,000 francs for 1920; total imports, 25,404,951,000 francs. The exports of food products from France during 1920 amount-

ed to 2,211,323,000 francs; of industrial materials, 4,772,124,000 francs; of manufactures, 14,252,907,000 francs; of postal packages, 1,198,403,000 francs. The imports of food products amounted to 8,618,155,000 francs for 1920; industrial materials, 16,800,548,000 francs; and manufactures, 9,986,248,000 francs. The adverse trade balance for 1920 was 12,970,194,000 francs against 23,919,667,000 francs for 1919, a decrease of 10,949,473,000 francs.

The figures given out by the customs house indicated the following movement of foreign trade, during the first nine months of 1920: The balance of trade against France during the first nine months of 1919 was 17,853,000,000 francs; for the first nine months of 1920, it was 10,632,000,000 francs, thus showing an improvement to an extent of more than 7,000,000,000, owing to the increase of exports. The value of exports as compared with previous year had increased 147 per cent. while the imports had increased 11 per cent. The sale of manufactured articles showed a surplus of 6,576,000,000 or 137 per cent. The increase in the exports for the first nine months of 1920 resulted from the purchase of raw materials and there was hardly any increase in the exports of manufactured articles. Imports of food products diminished to the extent of 685,000,000 francs or 9 per cent. The following table shows the comparison of exports and imports by classes for the first nine months of 1919 and 1920 respectively:

	Imports	First 9 months 1920	First 9 months 1919	Difference for 1920
Foodstuffs		6,727,751,000	7,413,563,000	- 685,812,000
Raw materials		12,618,645,000	9,542,228,000	+3,076,419,000
Manufactured goods		7,842,675,000	7,611,631,000	+ 231,044,000
Total		27,189,071,000	24,567,420,000	+2,621,651,000
	Exports			
Foodstuffs		1,529,501,000	709,085,000	+ 820,416,000
Raw materials		3,861,821,000	1,205,090,000	+2,456,731,000
Manufactured goods		11,366,389,000	4,790,042,000	+6,576,347,000
Parcel post				
Total		16,557,711,000	6,704,217,000	+9,853,494,000

In normal times imports exceeded exports by 20 to 25 per cent. After 1913, the excess was as follows: 1914, 31 per cent; 1915, 180 per cent; 1916, 232 per cent; 1917, 358 per cent; 1918, 372 per cent; 1919, 242 per cent. The increase of exports in the first nine months of 1920 over the corresponding period in 1919, shown in the above table, was distributed among all foreign countries and all of the colonies, but the chief increases were in sales to Belgium, England, Switzerland, and the United States. A noteworthy feature of the exportation was the sale to Germany which during the first nine months of 1920, amounted to 751,500,000 francs, while in the previous year no exportation to Germany had been registered. The imports to France during the same period fell off heavily in respect to England, Spain, and Brazil, but increased in respect to Belgium, Argentina, and Switzerland. France imported from Germany during the first nine months of 1920 goods to the value of 1,795,000,000 francs, of which 896,000,000 consisted of coal. A programme was prepared toward the close of the year for the promotion of commerce between France and Canada. Its main feature was the bringing of the two countries into direct relation and providing means of information in each in regard to the necessities and resources of the other. It was planned to exhibit samples of French goods throughout Canada in an exposi-

tion train and to conduct a party of French representatives along the principal Canadian railway routes. A great museum at Montreal was to receive the French exhibit and display it for the following six months. France had declared all her treaties of commerce at an end, including the treaty with Canada. The French Chamber of Commerce at Montreal had pointed out that this inevitably would occasion considerable difficulties and that already the termination of the treaty had worked against French exporters.

The merchant marine at the end of September, 1919, had reached a tonnage of 2,400,000, which nearly equalled the figure before the war, and it had increased since then. In the French shipyards, 513,000 tons were under construction at the end of 1919 and since that time some 30,000 tons had been purchased abroad. Private French shipyards would be able to add to the merchant marine in 1920, 310,000 tons; in 1921, 445,000, and in 1922, 500,000, thus bringing the total at the last-named date to 1,255,000 tons, not including certain new orders which would amount to 725,000 tons.

FINANCE: SITUATION AT THE BEGINNING OF 1920. According to the *Statesman's Year Book* for 1920, the budget for 1920 provided for an expenditure of 17,861,140,000 francs toward which existing taxes were expecting to contribute 9,367,800,000 francs, and new taxes, 6,516,406,000 francs. The expenditure in the extraordinary budget was placed at 7,568,083,055 francs.

During 1919 the note circulation increased 6,220,000,000 francs, the outstanding circulation at the end of 1919 being 37,275,000,000 francs. The metallic reserve at the end of December, 1919, held against this paper in circulation was 5,578,500,000 francs and the silver reserve was 268,100,000 francs. Down to the close of 1919 the amount advanced to the government by the bank of France was 25,500,000 francs exclusive of the permanent advance of 200,000,000 francs without interest. During 1919 there were three important loans floated, namely, 1,500,000,000 francs bearing 5 per cent issued by the city of Paris in May; 750,000,000 francs bearing interest at 5 per cent issued in September on the property of the state railroads; 100,000,000 francs which constituted the stock capital to the Crédit National which was subscribed by the leading banks of the country for the purpose of extending credit to merchants and manufacturers especially in the liberated regions; 4,000,000,000 francs issued in December, bearing 5 per cent. The total on Dec. 13, 1919, was as follows:

	Francs
Pre-war consolidated debt	32,241,692,000
Debt contracted during the war:	
Consolidated debt	73,116,641,815
Term debt	19,516,165,000
Floating debt	64,689,746,000
Bank advances (also largely war debt)	25,835,000,000
Total	215,999,244,815

The above classification of the debt does not distinguish between external and internal items. The external debt separately stated increased during the year 1919 from 27,292,000,000 francs to 33,861,000,000 francs. Such was the situation at the beginning of 1920. The government was then trying in various ways to increase revenues and introducing several novelties. One of these was the so-called bachelor tax, requiring payment of an extra 10 per cent by unmarried persons of both sexes subject to the income tax. Another new tax was the business transfer tax.

THE BUDGET. In May the ordinary budget was placed at 21,700,000,000 francs. There was much anxiety in respect to the budget for 1921, which in spite of the government's promises of prompt action was long delayed. On September 17, the finance committee met to receive the government proposals, but the plans of only four ministries were at that time ready. October 15 was fixed for the date but it was then put off. At the first meeting under the presidency of M. Millerand, the finance minister, M. François-Marsal, had brought the matter up, showing the necessity for cutting down the estimates so that it should not exceed the budget of 1920. The ministers concerned, however, did not counsel this reduction and it was decided to appoint the President, M. Millerand, as arbiter. In October, accordingly, he held conferences with the respective ministers. In November it was reported that the new budget would come to 26,000,000,000 francs.

RATE OF EXCHANGE. The great increase in rate of exchange dates from March 12, 1919, when there was a sudden inflation. This was followed by a slow increase for a short time, but a steady and rapid augmentation continued throughout the year 1919. This movement lasted till April 12, 1920, when the pound sterling stood at 67.45 francs and the dollar at 16.97 francs. On the following day it began to decline from this culminating point and it fell more or less regularly for several months. Toward the close of the year it declined again. Near the end of October the franc was worth 6.35 cents in American currency and on December 31, 5.92 cents.

FINANCIAL SITUATION IN THE AUTUMN. Efforts were being made to reduce expenses in concert with a commission of inquiry, which had been in session during the summer. Measures had been taken to improve the yield from the former taxes and to create new sources. It was estimated that the return from the former taxation for the year would exceed the budget estimates by 4,000,000,000. As to the tax on war profits, the government was contenting itself for the present with declarations of the interested parties as to the amount of their taxable property, but measures of control would be taken. Among the new sources were the increase of the customs duties on a large number of articles and the increase of taxes and the imposition of new taxes under the law of June 25, which would yield 8,500,000,000. It was expected that the ordinary budget of 1920 (21,700,000,000 francs) would be made to balance and even yield a surplus. The advances to Germany for the purpose of enabling her to proceed to the payment of the reparations had to be taken into account as did also the debts between the Allies. Measures

had already been taken for the reimbursement of the \$250,000,000 which constituted the French portion of the Franco-British loan issued in the United States in 1915, and the government would not fail to meet its obligations on the date fixed, namely October 14. The total public debt had been estimated in July at 235,739,000,000. In respect to the floating debt and the paper currency which greatly complicated the French financial situation it was evident that a progressive reduction was required. The means for its execution were on the one hand the reimbursement of the Bank of France, which would begin before the close of the year and which, pursued from year to year, would cause the gradual reabsorption of the excess circulation, and on the other hand successive loans which would hasten the movement. At the same time the floating debt would be consolidated. The Millerand ministry on coming to power had succeeded to the loan arranged for by its predecessor. (See below). It was necessary to proceed at once to place it for it had already been delayed a year. It was necessary in order to consolidate the greater part of the floating debt. The following account of financial conditions was given out by the government on the occasion of the opening of the new 6 per cent loan toward the end of October: Since the beginning of the year, the French government had ceased borrowing from the Bank of France. It could also be said that the inflation had not only ceased, but had begun to diminish. The government expected to pay back to the Bank of France at the beginning of the following year 3,000,000,000 francs. This would reduce the debt of the government to the Bank from 26,000,000,000 to 23,000,000,000 francs. Since the advances from the Bank of France had ceased, the work of paying or consolidating the foreign debt had been going on. The negotiations for the reimbursement of the Anglo-French loan by the United States (\$500,000,000) had been completed. Three-fifths of the French part of the loan (i.e. \$150,000,000) had been paid October 14, and the payment of the rest was provided for by long-term loan. The state treasury had been disorganized by excessive expenses. The state when in control of industry was inefficient and while that control had been necessary in war time, it should be brought to an end as soon as possible. Measures had been taken toward the return to normal conditions and various services had been suppressed. As to the money due from Germany, the government would not abandon any of its claims and Germany must pay without regard to her financial condition. A financial crisis, no matter how acute it was, did not destroy the productive force of a country and Germany still possessed the wealth of her own soil which had not been destroyed by the war. She had especially rich resources in coal, wood, and potash, and her manual labor was much less reduced than that of France. The ordinary budget comprising all permanent and normal charges would be supplied by means of taxation. All sums due the treasury would be collected so far as possible and an effort would be made to apply the laws more vigorously in respect to those contributions which were not yielding all that had been expected. Thus, for the extraordinary contribution of war profits, there had been received only

4,100,000,000 francs during the last three years of the application of the laws. The returns now amounted to 9,878,000,000, thus doubling in nine months the production of three years. Certain new taxes had been voted. France before the war had paid less than 5,000,000,000 francs in taxation, but henceforth would pay nearly 20,000,000,000. This had resulted from an appeal to the contributive forces of the country. In this the government had respected so far as possible the traditions, habits, and even prejudices of the country, which was always jealous of fiscal interference in private business. All the taxes which bore upon the general activity of the country showed a constant increase, thus indicating the return of normal conditions of business. On June 20, these increases had amounted to 1,634,674,200 francs which was 43 per cent of the budget valuation. In short, France's financial restoration kept pace with her economic restoration. In these respects the country had passed the period of its greatest anxiety and better times were indicated. For the future it would be necessary to put a limit on the increase of the short-term debt and not to increase the issue of Treasury bonds, but to consolidate and amortize those already in circulation. These were the main points of the future policy in respect to that matter. Other features were the reduction of expenses and the suppression of various services applicable only to war time. The extraordinary budget was not admissible unless the ordinary budget was provided with the means of settlement; but it should be limited to expenses incident to placing in operation the productive forces of France and her colonial empire.

The necessary sum for covering annual expenses of the government amounted to 18,500,000,000 francs, which was about three and one-half times the annual expenditure of the period before the war. This included the liquidation of all war expenses and the service of loans, but would not apply to pensions and to the cost of reconstructing the devastated regions since those expenses according to the Treaty were to be paid by Germany. Half of this sum was to go to the payment of the interest on war loans contracted by France. The whole of the 18,500,000,000 francs was entirely covered by the new taxes voted by parliament. More than that, these taxes furnished a surplus of 3,500,000,000, for their total return was estimated at 22,000,000,000. As proof of the excess that these taxes would yield, the following points were presented: During the first quarter of 1920, the excess of the budget over that of last year was 1,900,000,000 francs and this came simply from the indirect taxes. There would be in addition for the entire year about 4,000,000,000 which would not come from the new taxes, but from the development of commerce and industry. This latter amount represented about four-fifths of the total budget collections before the war. Moreover, the taxes on war profits for the four years 1916-19, inclusive, amounted to 4,000,000,000 francs. These points were cited by way of refutation of the pessimistic remarks circulated in foreign countries in regard to the financial situation of France and were presented as an answer to the frequent criticism that France had not financially placed her house in order—in short, that she was looking too much for outside aid and not helping herself enough.

Before the war France was paying in taxes only about 108 francs or \$20 a head each year: she was paying in November, 1920, 420 francs a head. The income tax as applied in France was reported to be pressing three times as heavily upon the French taxpayer, as the American tax upon the American taxpayer. As to the resources of France, she not only had the fertile land and mining resources of France itself, but there were the potash and iron deposits of Alsace and the Briey basin and her enormous colonial empire extending over an area greater than that of the United States with Alaska added, and including Africa, with its rich resources of wheat, wine, fruits, vegetables, cattle, hides, olive oil, petroleum, ivory, cotton, etc.; French Indo-China, with its rice and rubber and the inexhaustible resources, tea, cattle, coal, and other minerals to say nothing of the products of her island colonies.

THE NEW LOAN. Subscriptions to the new French 6 per cent loan were open in October and November. It was announced, December 2, that it had succeeded far beyond expectations, the total subscriptions being over 30,000,000,000 francs, or at the normal rate of exchange, \$6,000,000,000. The result occasioned surprise in view of the business depression prevailing in the country as the result of difficulties in adjusting retail prices to the lowering prices of raw materials.

RETURN FROM TAXATION, ETC. The yield for the calendar year 1920 from indirect taxes and monopolies was placed at 12,059,203,800 francs, an increase of 1,674,162,710 francs over the budget estimates. In addition to this the liquidation of French and American stocks yielded 1,649,572,100 francs and the Treasury had received 728,019,200 francs as revenue from the public domain and from other sources. The ultimate product of direct taxes was placed at 1,763,629,200 francs, of which on December 31st, 858,865,000 francs had been collected. The ultimate product of the general income tax and the *impôts cédulaires* was placed at 1,288,505,700 francs, of which 1,007,065,400 francs were applicable to the year 1920, the last-named sum being composed as follows: General income tax 587,337,700 francs; tax on commercial and industrial profits 331,632,500; salaries and wages 67,667,600 francs; profits of the liberal professions 12,065,500 francs; and agricultural profits 8,362,100 francs.

UNITED STATES AND FRANCE. The question whether the United States should supply financial aid was the subject of much debate throughout the year. The following summary indicates the French point of view: It was true that France was under deep obligations to the United States for her generous support during the war. Nevertheless, France felt that she could count upon further assistance in view of her economic condition. Certain objections were raised in America. For example, in the financial world, France was criticized for having a fiduciary circulation of more than 35,000,000,000 francs. To this the answer of the French was that while it was true, fully 20,000,000,000 francs of this amount had been applied to the liberated regions in default of the payment by Germany of the amount she ought to have paid. Moreover what better proof could there be of the financial sacrifices to which the French nation had consented than the increase of the French budget from 5,000,-

000,000 francs in 1914 to 12,000,000,000 francs at the end of the war, and to 21,700,000,000 in May, 1920. The Americans seemed not to realize the inexhaustible natural wealth of France: The vast deposits of iron for example in the basin of Lorraine; the enormous potash resources of Alsace; the phosphates of Algeria; the water power of the Alps and the Pyrenees; to say nothing of the great fertility of the French soil. These resources had not been exploited and this was due neither to the fault of the French nor to their lack of energy, but only to the wretched condition in which the Germans had left the invaded regions. The factories and industries of entire departments had been destroyed. In view of the incomparable riches of France it was asked what risk there was for American capital. All that France needed was time in which to repair her ruin. As to the rate of exchange, while the enormous appreciation of the dollar was disastrous for the French, it was likely to become a danger also to the Americans. It imposed an economic barrier which in the long run might close the French market to imports. For example, certain French manufacturers in order to escape the losses involved in the high rate of exchange had caused millions of tons of sugar to be purchased in Czecho-Slovakia and it was not unlikely that France would draw extensively on the food supplies in certain regions of central Europe to the injury of the American market. The success of the recent loan would no doubt show that America was not lacking in good-will. France appealed not only to American good-will, but to American self-interest. See below under *History*.

FINANCE. Reports published toward the end of the year indicated bad financial conditions and widespread anxiety over the state of the public treasury. In spite of the success of the national loan, the exchange situation had not improved and business conditions appeared to be growing worse. There was an excessive restriction of credits resulting in a serious stagnation in industrial enterprise. Various rumors were afloat as to the proceeds of the loan. It was said for example, that a large part of them had been already spent in advance. In Parliament the government was closely questioned and the finance commission of the Senate indicated that the budget estimates as yet not made public did not show the complete indebtedness and that supplementary estimates would follow. The finance minister offered an explanation of the conditions and agreed henceforth to take Parliament into the complete confidence of the government, in regard to expenditures and the way to meet them.

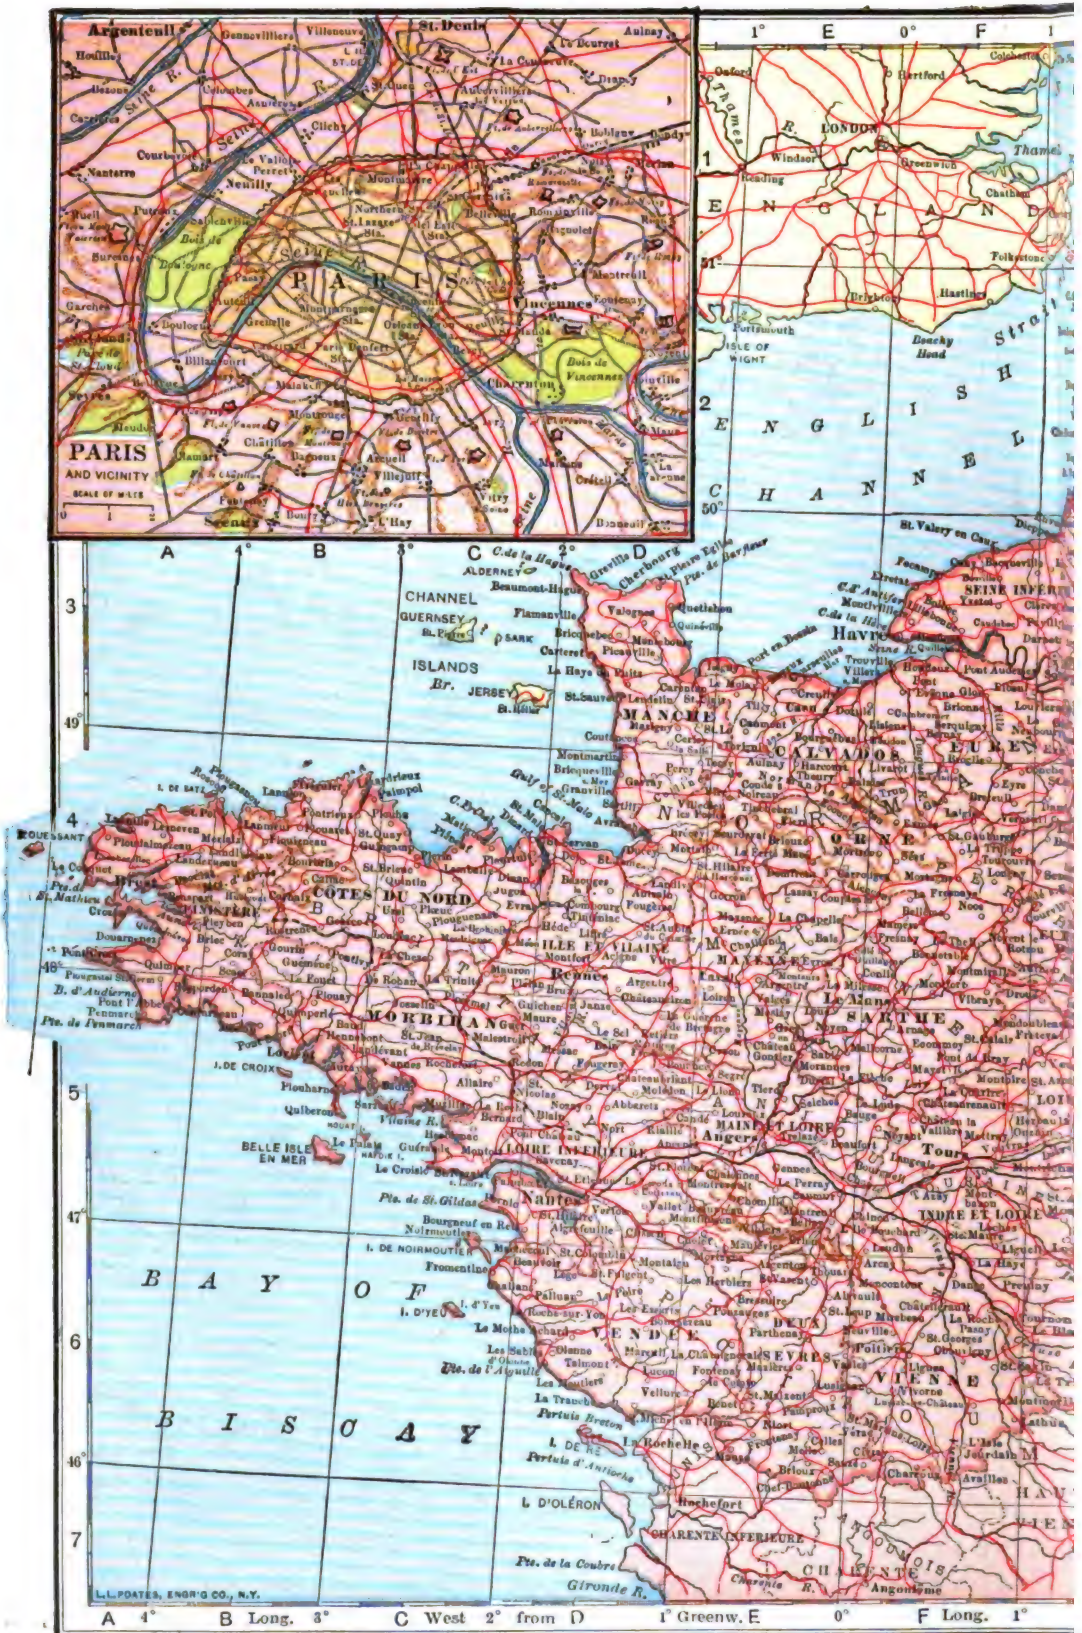

At that time it was reported that the French were sending to Washington the sum of \$150,000,000 in payment for its share of the Anglo-French loan by the United States.

RAILWAYS. The railways of France, which had in 1920 an aggregate mileage of about 26,500 miles were included in seven systems, five of which, the Paris-Orleans, the Paris, Lyons and Mediterranean, the Nord, the Est, and the Midi, were privately owned and operated. These private companies functioned under state concessions which expire between 1950 and 1960, when, under the terms of the concessions, the railways will be turned back to the state. The state system, founded in 1878, was formed out of the older lines and was extended in 1908 by the re-

purchase of the Ouest railway which had a mileage of about 3700 miles. The Alsace-Lorraine system turned over to France after the war was also operated by the state.

Inasmuch as France was the battleground for much of the World War, it was inevitable that in addition to problems common to transportation interests the world over, it should have its own and special complex situation. The outbreak of war in 1914 had found the French railways in good condition, and during the period of hostilities they were operated with considerable efficiency. However along with certain manifest strategic advantages among which was the convergency on Paris certain disadvantages were clearly apparent, chief of which were the inability to handle cross country traffic and the great independence of the different lines with each other. In France as elsewhere in 1920 the leading considerations with the railways were finances and labor. The war and its aftermath had affected both, and in particular operating expenses had increased far more than revenues. In 1919 operating expenses were 461,902,000 francs, or 225 per cent greater than in 1913, due not only to increased labor costs, but to the increase in the cost of fuel. This item alone had grown tenfold on account of the high price of imported coal which was consumed in much greater quantities than the French fuel. Increases in transportation rates were made at the beginning of 1918 to the amount of 25 per cent, and in 1920 to 70 and 80 per cent for passengers and 140 per cent for freight, but these advances only increased the receipts 89 per cent or 302,000,000 francs. At the same time the operating ratio rose from and average of 57 per cent in 1913 to 103 per cent in 1919. These conditions were destructive of any operating surpluses such as the three principal privately operated lines—the Paris, Lyons and Mediterranean, the Est, and the Nord—were able to record in 1913, when the excess of earnings over expenditures amounted to 8,000,000 francs, 7,308,000 francs, and 7,000,000 francs respectively. Subsequent to 1914 each of these roads had a deficit and the deficits of the other railroads increased. At the end of the financial year 1919 the total deficit for all of the railroads was 2,500,000,000 francs and it was estimated that the deficit for 1920 would almost approach that sum, making a total deficit of 4,500,000,000 francs. For the year 1920 an operating ratio of about 125 per cent was estimated.

With such deficits on the operating account in order to pay the shareholders of the railways the minimum guaranteed dividends, the Est, the Paris-Orleans, and the Midi received advances from the state. The state guarantee to the Nord and the Paris, Lyons and Mediterranean systems ceased after 1915, but they were authorized to borrow money in order to meet these dividends. This privilege, however, expired with the financial year 1920. Such conditions naturally called for some remedial measures and on May 18, 1920, the President of the Republic signed a bill for the reorganization of the railways in order to stop the financial drain due to the guaranty of minimum profits. The bill provided that the various lines should be coördinated so as to form a great national system. At first, the railways were to be operated by their existing managements, but subject to a council on which the companies, the men, and the users of the railways would be

represented. All the net receipts were to be pooled. From net earnings in excess of the sums guaranteed the companies there would be paid premiums to those which did well in the amount and operation of traffic; two-thirds of these premiums were to be divided among the employees. This arrangement involved certain additional measures concerning the employees referred to below.

By French railway officials at least, and also by many economists the eight-hour day was held responsible for much of the financial trouble prevalent in 1919 and 1920. It was established by a law taking effect April 23, 1919, even before the railways had been able to reorganize and adjust their operating conditions and forces on a peace basis. The first direct result of this action was to increase the number of employees to an extraordinary degree, and with increase in numbers went a more than corresponding diminished efficiency. From 1914 to 1919 there was an increase of from 25 to 32 per cent in the number of station employees, from 30 to 37 per cent in trainmen, and in excess of 40 per cent in engineers and trainmen. Where at the beginning of 1914 there were 355,900 railway employees, and in 1919 391,400, by 1920 the total had reached 500,000. Even under normal conditions such increases would mean many inexperienced men, and this of course was intensified on account of the post-war situation and resulted in decreased output and lessened efficiency. On one system where there had been an increase in the number of locomotive engineers amounting to 40 per cent on account of the eight hour day the daily average run had fallen from 67 miles in 1913 to about 40 miles at the beginning of 1920, while in the shops with the eight-hour day and the elimination of piece work the hourly output had shrunk to 50 per cent of what was secured before and the number of workmen had to be increased. According to French railway officials the eight-hour day had resulted in reducing the number of available freight cars, increased the number of losses, delays, and damages, and seriously retarded the return to normal operation. The effect on wages was to increase the amount from that paid to 355,000 men in 1913, 766,800,000 francs, to 3,276,000,000 francs paid to 500,000 employees in 1920, or an increase of 327 per cent in wages for a working force increased about 41 per cent.

Naturally rolling stock and other equipment suffered during the war, but in 1919 and 1920 the great trouble was an insufficient and inexperienced force in the shops to maintain locomotives as well as engineers and firemen to operate them. From an ante-war record of 9.8 per cent of locomotives out of service for repairs, the proportion increased to 20.5 per cent on Aug. 1, 1919, and was 22.4 per cent on Jan. 1, 1920. In the case of freight cars the condition was even worse, out-of-service cars increasing from 3.7 per cent to 15.7 per cent on Aug. 1, 1919, and 18.6 per cent on Jan. 1, 1920. In the last year practically double the number of men were required for the same amount of work as before the war.

Much reconstruction work was done on the French railways in the devastated territory in 1919 and 1920. A large part of the lines on the Nord and Est railways required entire rebuilding. The notable record of 1353 miles of 1407 destroyed put back in service in 20 months

was a distinct achievement for the French railway engineers. As a result of this effort and activity, transportation in devastated regions was practically restored to normal by the autumn of 1920. Furthermore French engineers were not only thinking of present needs for reconstruction. Electrification was receiving their earnest attention. In accordance with a law passed in 1919 to develop and regulate the use of hydro-electric power, sites for various generating stations were granted to the Paris-Orleans lines, while subsequently legislative provision was made for the development of hydro-electric plants on the Rhine River. In fact, electrification was planned for some 6000 miles of track distributed as follows: Paris-Orleans, 3250 miles; the Midi, 2125 miles; and the Paris, Lyons, and Mediterranean, 1525 miles. Naturally such a programme of electrification involved a capital outlay of several billions of francs, but the corresponding annual saving of 1,500,000 tons of coal which would be available for industrial purposes, not to speak of the improved traffic conditions and economies of operation. Just how this capital outlay would be financed was not announced in 1920. A committee on standardization adopted for future use direct current at 1500 volts as standard practice.

Two serious strikes on the French railways were notable and deplorable events of 1920. A four-day strike in February was followed by a more serious outbreak in May lasting 28 days and working untold damage. The May strike was stated to be a revolutionary movement, duly prepared for and supported by external agencies, though conducted by the Railwaymen's Federation, of which more than half of the workmen were members. The strike was in defiance of public opinion, and was dealt with rigorously by the government, aided by many loyal employees and volunteer workers enlisted from schools and universities as well as from many other walks of civil life. The federation was duly defeated and more or less disorganized but the damage done not only to the railways but to industrial life generally was unfathomable. The estimated loss to the railways was 140,000,000 francs and its effects were spread over several months. However it served to define the attitude of the general public toward such labor manifestations and the railways emerged in a better position. Previous to the strike there had been an important series of agreements between railway officials and the employees seeking to secure increased interest and cooperation from the workers who often were able to contribute suggestions of practical importance and benefit to the service. Furthermore these agreements provided for safeguarding the employees' interests in regard to promotion, increased wages, discipline, and enforcement of reasonable though strict regulations. The plan in substance was that the workmen should elect delegates to three committees. One committee was to represent the men at local points, the second committee was to confer with the general manager and a third committee was to confer with the presidents of the roads. The presidential committee consisted of 24 members, 7 from the transportation department, 7 representing the mechanical department, 7 representatives from the engineering department, and representatives from other departments.

It was provided that the general manager's committee should confer with the general man-

ager every three months and the presidential committee should confer with the president every six months. These committees were also to join with any inquiry board called to give its opinion on questions of discipline. The plan further provided for the representation of the employees on committees formed to consider employees' pensions and for the inspection of the coöperative stores. The workmen thus were able to participate in a very practical way in the management of the railways.

As a result of the agreement wages were standardized so that all employees of the larger railways belonging to the same class of service were to be paid alike. Length of service and yearly bonuses also were established.

ARMY. Figures supplied in 1920 showing the French forces engaged in the war and the estimates of casualties, etc., were as follows: The total number of white troops mobilized during the war was placed at 7,935,000 and of native troops of the colonies, 475,000. At the beginning of 1919, there were still about 2,300,000 French troops in service. Demobilization continued throughout 1919 and at the end of that year, the total strength of the active army including both white and colored troops was placed at about 800,000 of whom 150,000 constituted the army of occupation on the Rhine. This, however, did not include the forces engaged in Syria, Constantinople and the Balkans. The French colonies during the war furnished contingents of Senegalese, Algerians, Tunisians, Indo-Chinese, Moroccans, and other forces from the island of Malaga, Somaliland, and the French Pacific islands; and besides that, some 221,868 native workmen were supplied to take the place of Frenchmen engaged at the front, from Indo-China, Algeria, Tunis, Morocco, Madagascar, and China. The number of white troops killed during the war was placed at 1,390,600; of missing, believed to be killed, 245,900; wounded, 2,560,000. The number of native casualties was placed at 67,000 killed and 140,000 wounded.

According to figures in the possession of the United States War Department the army of France was, so far as effectives were concerned, the largest in the world, although it was surpassed by the Italian army when the reserves were reckoned in. The permanent French effectives December 31st were placed at 732,000, including colonial troops; the reserves at 1,560,000.

At the beginning of 1920, the question whether universal compulsory military service would be retained, was still unanswered and it remained under consideration during the year. Plans had been proposed for a conscription of 200,000 each year and the addition of 150,000 by voluntary enlistment, which would constitute an army on a peace footing of 350,000 and on a war footing of 1,300,000. A territorial and reserve force was also proposed which would give about 2,000,000. On February 22d the government at the request of the general staff, gave its permission for the maintenance of 1,000,000 men under arms, instead of 800,000, and the continuance of all supply departments on an emergency war footing. The war pensions had been liquidated, according to the Minister of Pensions, on February 1st, to the number of 660,000, but at that time there remained nearly five times as many to be settled. Of these, 1,975,000 were for disabled persons, 700,000 for widows, and 550,000 for dependents.

The question of the length of military service was under discussion in the latter part of the year. In October the War Minister, M. Lefevre, submitted his recruiting bill to the army committee. This was drawn up by the aid of the general staff and approved by the superior council of war. Those who supported it believed that the necessity of possessing an army sufficient to insure the peace during the period of the execution of the treaties required the maintenance of a large number of effectives. After that period, the three-year service might be given up but it should not fall below the two-year limit. The total duration of military service, according to the law of Aug. 7, 1913, terminated in the 28th year. According to the new plan it was prolonged to the 30th year. One-half of the recruits were to enter in the month of October of the year in which they reached the age of 20; the other half, six months later, in the month of April of the year when they reached the age of 21. The army consisted of the active forces with service for two years, the reserve with service for 18 years, and the territorial force with service for 10 years.

At the close of the year the future of the French army was still unsettled. The term of military service was not fixed for the regular army, nor was the period of training for the reserves. Various bills had been presented in the Chamber concerning the re-organization of the army, recruiting, and the term of military service. Competent military authorities declared that it was not possible to reduce the term of service to a year. The Minister of War, M. André Lefèvre, had opposed even the reduction to 18 months which had been finally agreed upon by the ministry, and had resigned in consequence of this disagreement, as noted below under *History*. At the close of the year, a government bill which embodied the principle of 18 months' service was still before the Chamber. The question of re-organizing the army and of replenishing the munitions, etc., was particularly important in view of the part France was playing in the East. In Syria and Cilicia her forces were serving virtually as police. General Gouraud who was in command estimated that for 1921 the sum of 1,200,000,000 francs would be necessary for the region, including 400,000,000 for the civil administration and 800,000,000 for the military. This amount seemed excessive to many critics, but the Prime Minister and General Gouraud still insisted on the necessity of this credit. It was argued on behalf of the French enterprise in the East that in the long run it would pay.

NAVY. The following table taken from the *Statesman's Year Book* for 1920, shows the number of vessels in the French fleet including those projected or in process of construction.

	Complete at the end of		
	1918	1919	1920
Dreadnoughts	7	7	7
Pre-dreadnought battleships ..	17	13	10
Armored cruisers	17	15	15
Protected cruisers	10	18	12
Gunboats, etc.	11	35	35
Destroyers	85	80	80
Torpedo boats	160	153	100 (?)
Submarines	100	100 (?)	104 (?)

See **NAVAL PROGRESS.**

France, like other great Powers, was concerned with the question whether the navy of the future should depend for its strength upon cruisers or submarines, and the matter was largely discussed

in 1920. England had not undertaken any construction and therefore had not decided the question. The other two great naval Powers, the United States and Japan, appeared to have decided for cruisers, and had projected superdreadnoughts and giant battleships of 40,000 tons. The French naval department, however, at the close of the year seemed to decide on the opposite policy, for it planned to build 100 submarines. The entire administration of the navy including the ministry, general staff, and superior council of the budget had agreed that, without condemning the cruiser, the best policy for France on the sea called for a submarine programme.

GOVERNMENT. As a result of the elections for the Senate held January 7th, M. Bourgeois was elected president of the Senate by vote of 147 to 125. M. Clemenceau withdrew his candidacy for the presidency of the Republic, January 12, and in the election that followed, M. Deschanel received a large majority, namely, 734 votes as against 66 for M. Jonnart, 56 for M. Clemenceau, six for M. Bourgeois, and one for M. Sadoul. Thereupon, the Clemenceau ministry resigned and a new cabinet was formed under the premiership of M. Alexandre Millerand, who took the portfolio of Foreign Affairs. The other members of the ministry were as follows: M. L'Hopiteau, Minister of Justice; T. Steeg, Interior; André Lefèvre, War; Landry, Marine; Isaac, Commerce; J. H. Ricard, Agriculture; François-Marsal, Finance; Albert Sarraut, Colonies; Le Trocquer, Public Works; André Honnorat, Public Instruction; Paul Jourdain, Labor; Breton, Hygiene and Social Welfare; André Maginot, Pensions; Emile Ogier, Liberated Regions. Of these M. Jourdain and M. Le Trocquer had been in the previous ministry. Question was raised by M. Daudet as to the eligibility of M. Steeg, who had been accused of close relations with the exiled minister, M. Malvy, but his resolution demanding an explanation was rejected by vote of 383 to 14. A vote of confidence of the government followed, giving 272 against 23 (297 not voting). The question of confidence again arose, January 30th, when the Steeg question was revived, and the government received a vote of confidence of 510 to 70, and still again on February 6th, on the question of foreign policy, when the vote stood 518 to 68. The programme as announced by the government comprised as its main features: Coöperation, increased production, and pursuance of a vigorous foreign policy along the lines already laid down. M. Deschanel was succeeded as president in the Chamber by Raoul Peret. M. Millerand was elected to the presidency, September 23, and was succeeded as Premier by M. Georges Leygues. See under *History* below.

HISTORY

THE CAILLAUX CASE. The sensational trial of Joseph Caillaux which was so long a feature of recent French politics and which has been described in preceding YEAR BOOKS reached its final stage in February, when the case was opened before the High Court of the Senate. Most of the points brought out were already familiar to the public, having been discussed in previous trials and in the press. The main issue was whether he was guilty of intelligence with the enemy or of correspondence with the enemy. In spite of the many dramatic disclosures in previous trials, it was not believed that he was guilty of intelligence with the enemy. This was justifi-

fied by the result. The court by vote of 213 to 28, declared him not guilty of intelligence with the enemy: but decided, however, by vote of 159 to 91, that he was guilty of dangerous correspondence with the enemy, though without criminal intent, and by vote of 128 to 110 extenuating circumstances were admitted. He was sentenced simply to the term of imprisonment that he had already served, namely three years, but the sentence also carried five years prohibition of residence in French territory and the deprivation of civil rights for 10 years.

SOCIALIST PARTIES. The French Socialist groups in general stood firmly against the foreign policy of the government and the majority of them were also sympathetic with Bolshevism in Russia and with the German proletariat. A Socialist manifesto was issued late in March, condemning French intervention in Syria and expressing sympathy with the German working classes. The radicals had the upper hand at the beginning of the year, and their strength throughout the year seemed steadily to increase. A Socialist congress was held at Strassburg in March, at which the minority who favored the policy of national defense was expelled. Thereupon, the expelled members called themselves a new party professing the pure principles of Socialism and opposing Bolshevism. On May 1st, a Socialist manifesto set forth the following four demands upon the government: (1) Complete amnesty for all political offenses, mutinies, and disorders occurring in strikes; (2) right of all state employees to form unions; (3) peace with the Soviet government of Russia; and (4) general disarmament. On May 2d, the General Confederation of Labor, which had defied the government's attempt to break it up, put forth a programme which made the following demands: An international association for the distribution of raw materials; an international fleet to be formed under the League of Nations to determine freight rates and permit the provisioning of countries according to the needs and the conditions of the market; the control and distribution of imports; and the elimination of the middleman. A further account of the activities of the French Socialists during the year will be found in the article **SOCIALISM**.

There were labor disturbances, more or less serious all through the year, owing to the effects of the war in general and specifically to the high cost of living. A general strike was ordered by the Confederation of Labor after a serious railway strike had been called out (February 24th) by the national federation of railway workmen, and in the middle of March, some 400,000 workers employed in mills, mines, and factories were involved. The government followed the example which M. Briand had made famous several years before the war during the great railway strike. It called the railway strikers to the colors and at the same time promised to remove just grievances. Its course was approved by the Chamber of Deputies by a vote of 503 to 75. The railwaymen in the national congress which opened in Paris, April 24, demanded nationalization of all lines, reinstatement of dismissed men, the right to form unions in all branches of railway work, and the abandonment of all proceedings against strikers. These demands were approved by a vote of 171,037 against 147,282. The General Confederation of Labor had come to their support, ordering out the seamen, dockers, and miners. The strike was unpopular and the company was

successful in maintaining the railway services in spite of it. The programme of the Confederation of Labor went much beyond the mere matter of wages or working hours. It called for the creation of a national committee to re-organize production and of an international arrangement for distributing raw materials and regulating freights; the re-organization of rail transport; control of imports; disarmament; cessation of colonial expeditions; an economic agreement among all peoples as a basis of coöperation. May Day was attended by its usual disturbances. It began peacefully, but a number of riots occurred and over 30 of the rioters were arrested.

NEW POLITICAL GROUPING. On June 17th an alliance of parties was announced under the title of Republican-Democratic Alliance of Social Action and National Reconstruction, which was said to control 260 votes in the Chamber and whose programme comprised the following features: Opposition to the dictatorship of any single class and substitution of class-solidarity for class-hatred; insistence upon hard work for the reconstruction of French economic life and upon the restoration of unity; abolition of the right to strike, except for specified reasons; and maintenance of law and order.

FRENCH RADICALISM. Some excitement was caused in conservative circles by an alleged international conspiracy between the directors of the General Confederation of Labor and the Socialists of France on the one hand with the extremists in England and the Committee of the International at Amsterdam on the other for the turning of France into a Bolshevik republic. In August the Socialist group in Parliament announced that they would interpellate the government in regard to the expulsion of the two English delegates and they demanded the calling of Parliament. This was at the time when the decision of the French government to recognize General Wrangel (see *WAR OF THE NATIONS*) was causing trouble with the English and an agreement on the matter between the two Allied governments had just been worked out. The Socialists tried to alarm the country over the danger of war. At this time the secretary-general of the Confederation of Labor set out for Amsterdam to attend the meeting of the International Bureau of Labor. The French General Confederation of Labor had urged the calling of this meeting in order to consider recent events in Poland. It was understood that the delegates to it would engage in the name of the workingmen of their respective nations to refuse to manufacture arms and munitions and to oppose any warlike venture by every means in their power, including the general strike. See *SOCIALISM*.

INTERNATIONALISM. There were in France representatives of liberal policies corresponding to those of the British Labor Party in England and the liberal elements in the United States that favored an international organization more radical in its scope than the existing League of Nations, but little publicity was given to these French groups in the foreign press, which quoted chiefly from sources committed to the support of the existing French government and to the most extreme immediate exactions from Germany. Such criticisms by French writers were mainly those from Socialist and Syndicalist quarters. In the course of the year a small group was formed which became known abroad chiefly on account of its literary origin. It was founded by

M. Barbusse, author of the remarkable novel, *Le feu*, translated into English under the title of *Under Fire*. This organization was termed *Clarté* from the title of a later book by M. Barbusse in which his ideas on international policies were presented more definitely. A number of well-known men joined the organization which carried on an active propaganda. The main point in its programme corresponded to the principal thesis of M. Barbusse's second book, namely, that war was not to be attributed to the wickedness of any one country—that all countries and not Germany alone were to blame for the late war, that the principal cause of the war was to be found in the spirit of nationalism, in the selfishness and narrow patriotism characteristic of all nations, that in a sense all governments had been guilty in 1914–18, for while Germany was the immediate offender at that time, every government had done similar things in the past. Therefore in order to put an end to war it was necessary to consolidate the peoples of the world. The principles of the new group involved extremely radical changes of a social as well as an international character. By the press generally, this movement was condemned on account of its immediate bearing on the question of Germany. It whitewashed the Germans, according to its critics, relieving them from all punishment and reparation and so encouraged them to begin again. It greatly offended a large part of the public, by accusing the French government of the same imperialism as Germany had shown. Documents were circulated by the group to prove that the war itself was not exclusively due to the Germans. In short, the issue which it raised was the familiar one of pacificism. The radical and logical endeavor to assure peace in the future involved its authors in a criticism of their own country, which was immediately seized upon as proof of their disloyalty; so the issue was between treason to their own country and allegiance to a dogma of universal peace. Practically the movement was believed to be of no importance, but on its theoretical side, it gave rise to animated discussion.

KAMERUN AND TOGO. The status of the former German colonies Kamerun and Togo was a vexed question during 1920. Points brought out in the course of discussion with the minister of the colonies were as follows: Article 119 of the Treaty provided for German renunciation of these colonies and article 22 laid down the principles which should guide the nations that assumed control of them. The distribution of mandates was decided by the Supreme Council of the Allies. All the German colonies with the exception of the two mentioned above passed under the mandate of the British Empire, Australia, and New Zealand, Japan, and the Union of South Africa, and the Council decided that France and Great Britain should come to an agreement. France and England agreed upon a geographical partition of the territories they had conquered. That was the situation down to the closing months of 1919. An agreement was reached between the French and English authorities both central and local and the process of evacuation and of taking possession began in 1920. In the French territories the organization of the government was also begun. Councils of administration, courts, and a financial system were provided for. The customs system of Kamerun was the subject of special decree which fixed the

rights of entry and clearance according to the principles of the decree in respect to French Equatorial Africa passed in 1912. Another decree arranged for the liquidation of German property in the two colonies. An important decision was reached on Dec. 9, 1919, by the Supreme Council giving France the right to recruit troops in the country not only for local defense but if necessary for service in France. As to the question whether the colonies were to be governed under a mandate or on the principle of territorial sovereignty, the Minister of the Colonies said that the point was still undecided. A decision of the Supreme Council on May 7th which had been applied to the Kamerun and Togo, left the impression that the territories were to go to France without mandate, but France intended to administer them in the spirit of a mandatory power. France entered into full possession of the Kamerun and Togo, October 20. The question of status remained unsettled, the precise meaning of the term mandate being subject to debate. It was interpreted by some as admitting virtual annexation.

OFFICIAL RELATIONS WITH GERMANY. A German ambassador for the first time since 1914 presented his credentials to the President of the French Republic September 29th. The new ambassador, Dr. von Mayer, declared that he would do all in his power to bring about friendly relations on the bases established by the Treaty, and President Millerand replied to the effect that the policy of his government was based on the belief that the only means of removing difficulties in the way of good relations between the two countries was the loyal execution of the Treaty. Upon the ambassador's first official visit to the government he repeated his assurances that Germany would act in good faith and the French Prime Minister replied that all that the French government desired was certainty that the German government would fulfill its obligations. Once that was assured, France would do all in her power to establish normal political and economic relations with Germany.

NEW PRESIDENTS. There were two presidential elections during the year. On the retirement of M. Poincaré in January the two leading candidates were M. Clemenceau and M. Paul Deschanel, but in the preliminary meeting M. Deschanel received 409 votes against 389 for M. Clemenceau and the latter withdrew his candidacy, January 16. M. Deschanel was elected, January 17, by 734 votes out of 888 recorded. President Deschanel began to show signs of illness in the spring and fell or jumped from his special train as it was approaching Hontargis in the night of May 23d. He suffered from serious nervous disorder, but from time to time was reported cured. His malady increased, however, and after varying reports on the subject in the newspapers it was announced on September 16th that he had placed his resignation in the hands of the council of ministers. The leading candidate for succession was M. Alexandre Millerand, the Premier. The election was held, September 23. The platform on which M. Millerand accepted the nomination contained the stipulation that there should be no marked change in national policy, that is to say, no compromise in respect to the revision of the Treaty, etc. The final result was 695 votes for M. Millerand, out of a total of 892.

THE LEYGUES MINISTRY. The appointment of Georges Leygues as Prime Minister was announced September 24th and taken as an assur-

ance that the Millerand policies would be carried out. The new ministry was promptly appointed and the Chamber of Deputies passed a vote of confidence of 507 to 80. The principal points in the new Prime Minister's announcement were the continuation of the present French foreign policy and the necessity of revising the constitution. Other points were the reconstruction of the devastated regions and the guarding of the rights of new nations. On December 16th, the Minister of War, M. André Lefèvre, resigned on account of his opposition to the military service bill which fixed the term at 18 months in place of two years as he demanded. In his letter of resignation, he deplored the difference of opinion between him and other members of the cabinet in respect to French policy toward Germany and the dangers that France incurred on account of the attitude of Germany. France was under the necessity of defending herself from an attack through Poland, Czecho-Slovakia, and Roumania, and the danger in that quarter was increasing. M. Lefèvre was succeeded at the close of the year as Minister of War by Baron Flaminius Raiberti, who had been for a long time a member of the Democratic Left in the Chamber, where he had specialized in military questions and served for a number of years on the committee of the army.

THE POLICY OF MILLERAND. The election of M. Millerand as president after the resignation of President Deschanel in September was regarded as a definite endorsement of his policy. The main points in his policy may be summarized as follows: He had worked from the first for the strict fulfillment of the Treaty. Upon the appearance of German troops in the Ruhr Valley, he at once sent French generals to occupy German towns on the Rhine and in so doing did not await the approval of Great Britain. At the conference of San Remo, he argued with success for the strict enforcement of the Treaty and won over the British and Italian Prime Ministers to his point of view. At the conference of Spa, he maintained a vigorous attitude which brought the Germans to terms. In respect to Russia, he believed in the first place that the Soviet government aimed at a world revolution which might finally involve France and in the second place he feared that it would work with the old military element in Germany to restore that Power. Moreover, as the Bolshevik government had officially refused to recognize the debt to France of the old régime, France must oppose any negotiations which would lead to the recognition of that government. It has been and must continue to be the policy of France according to M. Millerand and his supporters to do everything possible toward the overthrow of the Soviet government. This attitude toward Russia accounted for the absence of French representatives from the trade and peace negotiations with Russia undertaken by Lloyd George, and the sudden recognition by France of General Wrangel in South Russia. It also accounted for French policy in respect to Poland, which country was supported by all possible means as the rampart against the Russians. When M. Millerand accepted the candidacy for president, it was on the condition that he should be allowed to supervise the foreign policy of the ministry, so that it might follow along the lines that he had laid down. Concerning the French government's attitude toward Poland, its recognition of General Wrangel, and its general policy

at the various councils during the year, see **WAR OF THE NATIONS**.

QUESTION OF REPARATIONS. There was a sharp division in policy between the French government and the other Powers in respect to both the amount of the reparations from Germany and the definite fixing of that amount. For an account of this friction which as between France and Great Britain was especially serious, see the article **WAR OF THE NATIONS**. In general, France held to a strict execution of the Treaty without regard to Germany's ability to pay and was opposed to fixing at an early date the exact amount to be paid. The French government repeatedly maintained that it was not asking Germany to pay more than she was capable of paying and that the immediate fixing of the amount was premature. It argued that France was unable to meet the necessities of the devastated regions and reconstruct the financial and industrial systems of the country without the payment of the reparation money. The attitude of Great Britain on this subject occasioned distrust and provoked hostile criticism. The friction between the French and British governments was aggravated by the decision of the latter not to seize German property under certain conditions. This was condemned by the French press as encouraging Germany to press for further changes in the Treaty and because it placed British trade in an advantageous condition as compared with the trade of her Allies. By removing the threat of confiscation, it deprived the Allies of a sanction for the enforcement of the claims against Germany. As the year went on France showed a tendency to conform more nearly to the policies of her Allies and there were repeated conferences on the subject, but down to the year's close the question was still unsettled and the amount of reparations had not been fixed. See **WAR OF THE NATIONS**.

THE QUESTION OF PLEBISCITES. The conclusion of the Riga armistice left France without immediate subject of anxiety in respect to Poland and, according to the government's supporters, had entirely vindicated the policy of M. Millebrand in respect to Poland but meanwhile, they said, Germany was as usual giving cause for concern. They declared that the Pan-Germans were continuing systematically their underhand work in Upper Silesia and were trying by every means to falsify the future plebiscite; that they had devised a plan for associating about 300,000 Germans from regions outside the territory in question; they they were trying equally to confuse the minds of the electors by bringing up the question of self-government, whereas the only point at issue according to the Treaty was to be the question whether the country should be attached to Germany or to Poland; finally that they were preparing to stir up riots and resort to force in case the vote turned against them. It was complained that while the Inter-Allied High Commission had taken all possible measures for assuring a fair vote the new English military attaché at Berlin, General Malcolm, had been won over by the Germans. In Vienna the National Assembly had voted unanimously for a plebiscite on the question of union with Germany. Austria, it was argued, was in fact dealing with the Treaty of Saint Germain in the same way that Germany was dealing with the Treaty of Versailles, that is to say she was seeking to evade its terms or delay its execution. By the former

Treaty the inalienable independence of Austria had been proclaimed.

THE NEAR-EASTERN POLICY. As noted above, under *Army*, the high estimates for the cost of maintaining French administration in the Near East were causing anxiety at the close of the year. On the one hand it was said that the policy was wasteful, while on the other it was urged that in the long run it would be profitable. The supporters of the government's policy argued that the cost of French occupation of Syria and Cilicia would soon diminish and the military authorities and the advocates of French expansion frankly expressed their satisfaction at the turn of affairs in Greece (see *GREECE, History*). That country had been a stumbling block to French foreign policy on account of Smyrna. The Turkish Nationalists under Kemal had harassed the French in their exasperation toward Greece. The French foreign office apparently wished to come to an understanding with the Turkish Nationalists and allow them to regain Smyrna, if they chose, for their hostility toward France in that case would cease and French troops would have no difficulty in maintaining order with greatly reduced forces. The Prime Minister, M. Leygues, had made it known after the action of Greece that he desired to revise the treaty of Sevres in that spirit and he spoke of an approaching agreement on the part of the Allies with Turkey. The insistence of Greece upon the recall of Constantine therefore had been a decided benefit to the supporters of the government's Eastern policy. It was argued that there was now no reason why the Greeks should remain at Smyrna. They had shown their political incapacity, and furthermore, the Allies were no longer under any obligation to them. Even among the friends of this policy, however, there was doubt as to whether the Christians of Smyrna ought to be placed under Mohammedan authority. See **WAR OF THE NATIONS**.

TREATY WITH CZECHO-SLOVAKIA. On November 4th the preliminary commercial treaty between France and Czecho-Slovakia was signed in Paris, providing for the reestablishment of freedom of trade so far as possible. It had in view the exchange of French products including phosphates, iron ore, and other raw material, for the glass and wood required in the devastated areas. It provided for direct shipment of Czecho-Slovak products to France by way of the Elbe River and also for through passenger service.

NEED OF FINANCIAL AID FROM THE UNITED STATES. On the occasion of the Financial Conference at Brussels, September 24-October 8, organized under the League of Nations (see **WAR OF THE NATIONS**), the French view of the situation and especially of the obligations of the United States was renewed with much emphasis in the press. The following résumé illustrates the spirit of French comment: A solution of the problem could not be had without both private initiative and government support or direction. In the first place moreover it was necessary that all of the countries concerned should accept the principle of international financial and economic unity in order that the wealth of one might offset the weakness of another. It was plain that Europe could not maintain an effective credit system without the support of the United States and eventually the participation of the other rich countries of America. It was argued

that the United States ought to lend her support, if for no other reason, because a financial disaster to Europe would certainly involve her. Unless means were found for restoring the economic equilibrium, Europe would undergo a crisis that would surely be felt in the new world. However, neither the United States nor the other nations represented at Brussels showed a willingness to take part in the measures that France and Belgium desired for their economic restoration. The remarks of the American delegate were discouraging on this point and occasioned much disappointment in France. But the newspaper commentators declared that France would put forth her full effort toward recovery nevertheless and some of them said that France would profit by the knowledge that the United States would not lend her any more money in that she would make all the more exertions on her own behalf. The French complained bitterly, however, that a misunderstanding had arisen from the fact that while the war is finished for the Americans it must continue for France so long as Germany has not fulfilled the obligations which she had incurred. The refusal to lend money to France, however, was not final. The American representative's remarks were interpreted as extremely favorable to the interests of Germany and as directed against the policy of France in respect to Germany. For example, he had congratulated the League of Nations on having invited to Brussels the representatives of Germany. In this he was said by the French to be blaming indirectly the conduct of France which had tried to exclude the Germans from the councils of the Allies. He said that the attitude of the American business men would change when the hostile feeling which prevailed between the different European states had disappeared. In this he was thought to be referring to the attitude of France. Again he said that when a struggle like this has ended it was the duty of the conquerors to meet their enemy more than half way. This was interpreted as meaning that France should hold out to Germany a hand of friendship. In an interview with the press he had remarked "Create the United States of Europe and everything will be settled." In short it seemed to the French that the American attitude was simply this: To get aid from America France must consent to revise the Treaty to the advantage of Germany, must renounce the largest part of the reparations due her, and must delay her own recovery in order to hasten that of her enemy. At that price American participation in the general work of reconstruction could be had. The French argued that the price was too high and the risk too great. The United States, it was said, were not disposed to forget what Europe owed them. France and Belgium on their side were not disposed to forget what Germany had done. French opinion could not understand why French credit in respect to Germany was any less inviolable than American credit in respect to Europe. France did not forget the sacrifices to which Clemenceau had consented in exchange for advantages that were not obtained. France did not demand a war indemnity but simply the reparation of great injuries inflicted without any military necessity and for the simple purpose of destroying her economic power after the war. The Germans should first be brought to recognize their debt and to give proof of their sincere intention to pay, then there might be talk of a reconciliation.

The French attacked vigorously all the ordinary arguments in everyday talk among Americans. For instance it was often said that after the Civil War the North and the South had become reconciled. To this the French said that the cases were not parallel for the North and South were not hereditary enemies during centuries. Again the simple remark that after a fight the contestants should shake hands and make up implied that the fight had been a loyal one. Here the case was entirely different for the one party had been attacked by the other and injury done and it was a matter of securing reparation for the injury. In short neither France nor Belgium could accept the above proposal. They could not forego the reparations provided for in the Treaty in exchange for vague promises. They could not relinquish their claim on Germany in return for a mere promise of a loan. Left to themselves they would at least be in a situation to hold their debtor to his agreement. Of course the period of reconstruction would be far longer and more painful but the French and Belgian peoples were willing to resign themselves in the inevitable and would put forth all the economic effort to which they were capable.

FRENCH FOREIGN POLICY. As is shown under **WAR OF THE NATIONS**, the conflicting ambitions and interests of the Allies against Germany gave rise to endless discussion in the press during the year. Unfortunately the writers having in view only the prepossessions of their respective publics were inclined to neglect the arguments of their opponents and to present only the aspects that were more attractive to themselves. Thus the long disputes often ran in parallel lines exhibiting hostile points of view but offering no serious basis for discussion. The following account of French foreign policy is taken from the writing of prominent French publicists, including the summary of French policy presented by President Millerand upon his assumption of office. The charge that the attitude of France was determined by imperialistic motives was dismissed as absurd. French policy aimed first at the strict execution of the Treaty. The Treaty had not given France by any means all that she had a right to claim. It was the result of compromise and of a strict working out with the Allied Powers whose interests had been duly considered of an agreement that should lead to an enduring peace. It was, said President Millerand, the new charter of Europe and the world and it constituted the sole guarantee that France possessed after four years of war that the injuries she had suffered would be repaired. The most elementary justice required that its terms be fulfilled and that France should have the means of making sure that her enemy of yesterday was not preparing a new attack for tomorrow. If France did not watch scrupulously over the execution of the Treaty she would betray the soldiers who had fallen and would deliberately sacrifice what she had a right to expect from her victory. In Germany, as was well known, the press continued to preach the duty of hating France and insisted that France was actuated by imperialistic motives. This had arisen simply from the fact that France had insisted that the Treaty be executed. Evidently they thought at Berlin that they might win from among the Allied Powers some support for a programme of revision. For example they planned to discuss with the Allies, when they

should meet at Geneva, the question of reparations although that question had been definitely settled by the Treaty. France had succeeded in avoiding this danger in that instance. At the international financial conference at Brussels (see WAR OF THE NATIONS) France had tried to checkmate this movement by insisting that the debates should not deviate from their real purpose and go into the question of revising the Treaty. France remained entirely faithful to her alliances in spite of the efforts in certain quarters to exaggerate the differences of policy between her and England on the one hand and between her and Italy on the other. France had no intentions that could not be reconciled with the legitimate interests of her Allies. In spite of the divergencies in certain respects between the views of Millerand and Lloyd George, the Anglo-French relations continued to be entirely cordial. As to Italy, the interview between Millerand and Giolitte at Aix-les-Bains had forestalled any misunderstanding as to relations between Paris and Rome. The Franco-Italian alliance remained solid. With Belgium, of course, her alliance was beyond question as had been recently emphasized by the military accord concluded between the two states some weeks before. President Millerand declared that France would watch with jealous care against any attempt upon the interests or rights of the nations that had had their birth, or had been revived, as the result of the victory. This referred especially to Poland and the case of that country proved that there was not only a moral but also a political duty of aiding nations that had arisen as the result of the war and of protecting and maintaining them. This constituted a guarantee of the new balance of power in Europe. The French foreign policy was above all a policy of peace and international justice. France was trying to open in a practical manner the way for the development of the League of Nations but she did not intend to be taken unaware by the criminal designs of those who hoped to find a possible revenge for their defeat through systematically favoring in Europe the elements of disorder and anarchy.

While in England, the United States, Italy, and among liberal or radical groups elsewhere, the Treaty was criticized as too severe against Germany, not from the point of Germany's deserts, but from practical considerations of the effect upon the future peace of Europe, the prevailing view of French publicists, as quoted in the press, continued to be precisely the opposite. In addition to the views noted above, the following summary of articles by well-known publicists is fairly typical of the French official attitude during the year: By the convention of Spa, Germany was to deliver to France each month 1,550,000 tons of coal. In the month of August she delivered 1,600,000 tons. She did this simply because penalties were attached to her refusal, since the convention provided that if she did not keep the agreement the basin of the Ruhr would be occupied. This showed that the only way to insure German execution of the terms of the Treaty was to impose penalties in case of failure, but that is precisely what the Treaty had not done. The only sanctions in this bulky document were comprised in a page or two and when boiled down amounted only to this: As a guarantee of the execution of the terms by Germany, the Allies will occupy for 15 years the German territories west of the Rhine. Now if

Germany had been victorious she would not have been satisfied by such slight measures. The Treaty of Frankfurt after the war of 1870-71 showed what her policy would have been. By that Treaty, if France had not paid within 40 days her first half-billion the Germans were to remain on the Somme, the lower Seine, and the right bank of the Eure, that is to say in the very heart of France.

Many details were revived by French publicists during the year as to the severity of the German terms in 1871 and the subsequent relentlessness of Bismarck. These misdeeds of the Germans in 1871 formed indeed a considerable part of the French discussions in the press, the inference being, apparently, that although it was a policy that had been attacked by Frenchmen as criminal for the past 50 years, and celebrated in French popular literature as proof of German brutality, it nevertheless set an example for France to follow when her time came. It was pointed out that the same French writers who held up Bismarck during the late war as an arch fiend seemed to regard him, after the war, as a model for imitation. This line of argument very common in French journalism seemed to be unintelligible outside France even among those who sympathized with the policy of the French government. The theory that France should treat Germany as Germany had treated France seemed to dominate the minds of a great many prominent French writers, to the exclusion of all that had been said about the purposes of the war; the things that had been cited as menacing civilization were apparently now appealed to as motives for French policy. How far this represented the true French point of view could not be ascertained, but it fairly represented a great part of the discussion that appeared in the press.

Germany, according to the French view, was plainly counting on divisions among the Allies, specifically on such serious questions as those of Upper Silesia and Austria, and in general upon every incident which brought in question the application of the Treaty. The German press had made much of the good faith shown by the German government in carrying out the agreement of Spa as to the delivery of coal. But the Allies had reduced the amount of coal that they demanded and consented to certain advances to Germany. So it was to the interest of the German government to deliver promptly an amount of coal which was less than the Allies had a right to claim. Moreover the Allies did not insist upon the same quality of coal as had been promised. Altogether it was a relaxation of the stipulated terms. Then as to the agreement in regard to disarmament, Germany did not deserve any credit for accepting its terms because a period of grace was allowed. Finally the Germans were not satisfied with the agreement of Spa and already they were saying that it had caused much difficulty and were talking about the necessity of revision in Germany's interest. While the German ambassador at Paris maintained a perfectly correct attitude, Germany was trying in the autumn to induce France to accept the proposals that Herr Simons and Herr Stimmes had made at Spa, which looked to a colonization by Germans of the devastated regions of France. At the same time there were many demonstrations of hatred against France in all the large cities of the empire on the occasion of Hindenburg's birthday, and in the

course of them the revision of the Treaty was violently demanded. German official delegates had insinuated themselves into the Brussels Conference and there lobbied among the neutral and Allied nations in order to win their compassion. It was even said that Germany was on the point of bankruptcy; that the taxes yielded no results; that they could not issue loans to consolidate the floating debt which exceeded 186,000,000,000 francs August 31, and was increasing every day; that the circulation of the paper marks had reached 900,000,000,000 and was still increasing; that, in short, Germany could not pay a cent toward reparations. The same tactics were followed systematically. Germany wished, contrary to the Treaty, to have the amount of her indebtedness fixed in accordance with her ability to pay because she hoped to obtain in advance a reduction of the debt. Fortunately the League of Nations under the presidency of M. Bourgeois had refused to concern itself with these matters. Such in general was the tone of French comment on the situations arising between Germany and the Allies, described in detail under the WAR OF THE NATIONS.

FRANCE AND THE VATICAN. Throughout the year 1920, there was frequent discussion of the resumption of official relations between the French government and the Vatican. Several incidents including the funeral of Cardinal Amette, in which members of the government paid honor to the dead indicated the adoption of a new attitude toward the Holy See. In November, after the nomination of Cardinal Dubois as archbishop of Paris, the subject again was brought before the public. On this occasion the Radical party renewed its expressions of alarm. As anti-clericals, they naturally sought to prevent the renewal of diplomatic relations of the Vatican. The government on the other hand had clearly set forth the reasons for renewing these relations and a measure to that effect had been introduced in parliament after the subject had been investigated by parliamentary committees. The Radicals asked what advantage this policy would have and they drew the lesson from the nomination of the Cardinal as archbishop that if the relations with Rome were renewed, Rome would have the right to nominate an archbishop of Paris without consulting the government. In reply to this it was said that it had no relation to the new bill. The law separating church and state was still in force, so the nomination of an archbishop of Paris depended only on Rome in any case, under this law, and a resumption of all diplomatic relations would make no difference. The object of such resumption was to place matters of foreign policy on a better footing. It would not affect existing laws. As to the condition of the Church in France, a Catholic writer in the *Revue des Deux Mondes*, after analyzing the law of 1905, concluded that the associations of worship of 1905 offered the church in France the best means of escape from the crisis in which it found itself. As soon as the question of renewing diplomatic intercourse with the Vatican came up, the Church authorities naturally began to concern themselves with the laws affecting the Church in France. Fifteen years had passed since the law of separation (1905). The Pope, Pius X, in view of the defects of the new laws had forbidden the use of the associations so long as the priesthood was not secure, but since then,

the council of state and the supreme court in its decisions had constantly protected the rights of the priesthood. Hence, it was argued that the Holy See might feel assured in regard to the associations and ought now to have no objection to their functioning. At the same time it seemed natural to the Vatican that the French government should wish to know about the nomination of bishops in the future. The re-opening of diplomatic intercourse with the Vatican would admit the discussion of that matter. In short, the situation as summed up by friends of the new bill was briefly as follows: There was a law of separation and it was observed. There was also to be under the present bill a restoration of intercourse which would make it possible to discuss questions affecting both parties concerned. The question was voted upon in the session of November 29. After an explanation by the prime minister, M. Leygues, the Chamber passed a vote of confidence of 387 against 195 and then voted for the law by 397 against 209.

POLITICAL SITUATION IN DECEMBER. As is shown in the article WAR OF THE NATIONS, all French foreign policy during the year was marked by a spirit condemned as reactionary by the liberal element in Europe and the United States. The election of November, 1919, was plainly a triumph of the Conservative parties and it seemed to represent the state of the public mind at that time. The so-called Radical Socialists, who it will be noted were neither Socialists nor particularly radical, lost their numerical superiority in the Chamber and power passed into the hands of the national bloc formed out of the parties of the Right which had won the victory at the polls. This national bloc was in control throughout the year 1920. Its principles were characterized by its opponents as main militarist, clerical, and reactionary. It was behind the government in its vigorous execution of the Treaty, its constant suspicion of German treachery and ambition, and its renewal of relations with the Vatican, etc. In general the parties of the Right were intensely nationalist abroad and conservative at home, favoring uncompromising measures against the Socialists, extreme radicals, and strikers. M. Millerand had perfectly represented them in his insistence on strict fulfillment of the Treaty and his opposition to the British policy of conciliation. It was only under great pressure from Lloyd George that he had agreed at San Remo to discuss with the Germans the questions of reparation, disarmament, and coal, and he was with difficulty brought to the attitude that he took at the Spa conference. After the Spa conference the Chamber voted a resolution disapproving the policy of discussing matters directly with Germany. There was reported to be a tendency toward a more liberal policy at the end of the year. M. Leygues, the new prime minister, for example, had acted in direct opposition to the spirit that had animated French foreign policy when he supported the Brussels reparation conference and, moreover, he had openly condemned the former policy towards Germany by nominating as French delegates to the conference functionaries of the government. Again he ran counter to the militarist spirit of the Right in favoring the reduction of military service and in the matter of the army. He held that general opinion demanded a short term of service and strict economy in military expenditures. This

was brought to an issue as above noted by the resignation of the war minister, M. Lefèvre, who along with the general staff wished the long term of service. It was thought by some that this resignation would cause immediately the fall of the government, but down to the close of the year this had not happened. In liberal quarters it was pointed out that although the attempt to fill the public mind with the constant dread of the revival of German aggressive military power had been most skillfully carried on throughout the year, there were signs in December that it was less successful. Reports of German military preparations for the future under the guise of police and civic defense were circulated without interruption during the year and at the close of the year as noted elsewhere Marshal Foch was charging the Germans with plain violation of the Treaty in the matter of the police forces. There was a great outcry in the nationalist press over these charges at the close of the year, but opponents of the government declared that there was no evidence that public opinion was deeply disturbed by it. On the contrary, they said, there seemed rather to be a general insistence upon national economy, reduction of all unnecessary expenditures and of taxation, and a return to the works of peace: that there was arising a stronger opposition to military adventures abroad, whether pertaining to the extension of the French colonial empire or to the crushing of Germany.

The above, however, represents only the point of view of the liberal element. On the other hand there were indications that the force of conservatism was still in control and that the Leygues government was losing its power. It was criticized in many quarters for its laxity. In the country there were signs of impatience with its lack of vigor in the matter of the German indemnity. The peasants had been made to believe that Germany would be made to pay promptly and they were beginning to complain of false promises. Among the people, it was not understood why France should make advances of money to Germany as a condition of Germany's supplying the coal that was due. This outcome of the Spa conference though intelligible enough to well-informed persons was incomprehensible to the masses. Moreover, there were indications that Millerand's politics were still generally favored and that Millerand himself was incensed by the prime minister's departure from them. Impartial observers believed that the time had not come for success of a more liberal and conciliatory policy, and that in a trial of strength, the element represented by Millerand would prevail.

FIFTIETH ANNIVERSARY OF THE REPUBLIC. The entire country celebrated on November 11, the 50th anniversary of the republic, at the same time that it celebrated the second anniversary of the armistice. The occasion was celebrated by the transfer of the heart of Gambetta to the Pantheon and by the burial of the body of an unknown soldier at the Arc de Triomphe. An impressive ceremony was held at the Pantheon at which the President, M. Millerand and the Cabinet, Representatives of Parliament, and Marshals of France were present; hymns were sung in honor of France and addresses were delivered. Ceremonies at the same time were held throughout the provinces and especially at Jardiès and Verdun. The burial of an unknown

soldier was also a feature of the English celebration of Armistice Day.

THE PRESIDENCY. The election of two presidents in the course of the year revived discussion of the presidency, and the question of revising the constitution in order to change the functions of the president was frequently debated. Many objections were raised to the present limitations of the office, which were of a nature to reduce the incumbent in the opinion of many to a mere figure-head and to lead to the choice of mediocrities. The difference between the powers of the French president and those of the President of the United States was often pointed out, and it was even argued that the authority which constitutional changes had left in the hands of kings in the few remaining constitutional monarchies, surpassed that of the French president. On the other hand the presidency in the United States seemed to many a bad model for France since it was based on a system more antiquated than the French. Many solutions were offered and criticisms made from widely varying points of view. In general, among the conservative element it was thought to be an unpropitious time to make the change and that it was better to wait until the difficulties following the war had been reduced.

MARSHAL FOCH AND M. CLEMENCEAU. In November there was a lively discussion in the press of certain points at issue between M. André Tardieu and Marshal Foch. The chief question had to do with relations between the latter and M. Clemenceau at the crisis of the war. Marshal Foch said that he had been raised to the supreme command only after M. Clemenceau had yielded to the insistent demands of others including Marshal Haig, and he declared that his relations with M. Clemenceau had been strained. M. Tardieu speaking in the name of M. Clemenceau replied that it was M. Clemenceau who had obtained for the Marshal the supreme command and moreover, that M. Clemenceau had been the constant champion and defender of Foch throughout. Denials on one side or the other followed and for a time the subject assumed a space in the press far out of proportion to its importance.

REGIONALISM. In 1920 the subject of decentralization was under discussion. For a long time the movement had been going on and various projects for regionalism had been submitted. In 1920, several of them were brought before the government and subjected to the examination of the cabinet. In the autumn the principal project to this effect, comprised the following aims: To relieve the central power of decisions involving small questions which might with advantage be settled by local organs; to facilitate local initiative where it has already developed since the war; to give to the respective regions of France more intense local spirit. This plan looked to the establishment of regional councils composed of representatives from the general councils and from the chief professions and chambers of commerce in the region. It was argued that so far as the expense was concerned, the plan was greatly reducing costs in that it would do away with many offices in the department. It did not aim to restore the old historic names of Burgundy, Provence, etc., but to name the new regions after their principal city.

FRANKS, Sir KENDAL. British surgeon, died, May 20. He was born Feb. 8, 1851, and educated at Trinity College, Dublin, and at Leip-

zig; served in South Africa and was consulting surgeon to the Johannesburg Hospital and president of the South African committee of the British Medical Association. He was afterwards examiner in surgery at the University of Dublin and surgeon-in-ordinary to the Lord Lieutenant.

FRASER, Sir JAMES. Scottish physician, died, January 4. He was a professor in the University of Edinburgh after 1877. He was born at Calcutta, India, Feb. 5, 1841, and educated at the University of Edinburgh. He held many important offices on medical commissions and in medical institutions, having been president of the Indian plague commission, 1898-1891; president of the Association of Physicians of Great Britain and Ireland, 1908-9; a member of the University Court, 1904-13, etc. He was dean of the faculty of medicine at the university from 1880 to 1900. He wrote papers for the transactions of the chief medical societies.

FRASER, Sir THOMAS RICHARD. British medical authority, died in January. At the time of his death he was emeritus professor of materia medica in Edinburgh University. He was born in Calcutta, India, Feb. 5, 1841, and graduated in medicine at Edinburgh in 1862. In 1877 he was appointed there to the professorship of materia medica which he held throughout his life. He was dean of the faculty of medicine from 1880 to 1900. A partial record of his official career is as follows: Medical Adviser to the Prison Commission for Scotland; Representative of the University on the General Medical Council after 1906; President of the Indian Plague Commission, 1898-1901; President of the Association of Physicians of Great Britain and Ireland, 1908-9. Down to his time the students had been taught about the preparation of medicines rather than their action. Sir Thomas Fraser attempted to fill the requirement of a definite knowledge of the action of drugs, and his success in the study of symptoms in connection with treatment and of the precise action of drugs upon the tissues of the body helped to bring on a new era in therapeutics. His work was studied widely by the physicians of his time.

FRENCH, PERCY. British humorist, author, and artist, died, January 24. He was born in 1854, and educated at Trinity College, Dublin. After six years' work as a civil engineer, he became the editor of a Dublin humorous paper and later composed many songs and wrote the words for them. He studied painting and produced some paintings of Irish scenes. He gave a series of entertainments in which he combined songs, narrative, and sketches. Among his writings may be mentioned: *The First Lord Liftinart*, *Phil the Fluter's Ball*, *The Mountains of Mourne*, *Come Back Paddy Reilly*, *Noah's Ark*, etc.

FRY, JACOB. Theologian, died February 19. He was born at Trappe, Pa., Feb. 9, 1834; graduated at Union College in 1851, and at the Lutheran Theological Seminary at Gettysburg in 1853, when he was ordained to the Lutheran ministry. After holding pastorates at Carlisle and Reading, Pa., he became a professor in the Lutheran Theological Seminary in Philadelphia in 1891, holding that chair until his death. He was author of *Elementary Homiletics* (1897), *The Pastor's Guide* (1915), besides various tracts and sermons.

FRYER, Sir CHARLES EDWARD. British authority on fish culture, died at Watford, England, November 19. During many years he was

the author of numerous annual and other reports on the fisheries. He was born in July, 1850, and entered as clerk in the office of the inspectors of fisheries in 1869. He was a member of various commissions of inquiry into the fisheries of the British Isles from 1874 to 1915; rendered important service to New Zealand in the introduction of trout; was a member of the most important fishery congresses during many years; and from 1874 to 1890 was editor of *The Colonies and India*. He wrote various treatises on the subject of fisheries including *Relations of the State with Fishermen and Fisheries* (1883); *International Regulation of the Fisheries on the High Sea* (1910); and *The Management of our Salmon Rivers* (1916).

FRENCH ACADEMY. See ACADEMY, FRENCH.

FRENCH CONGO. See FRENCH EQUATORIAL AFRICA.

FRENCH EQUATORIAL AFRICA (formerly FRENCH CONGO). A French colony situated in equatorial Africa, with Kamerun on the northwest, Wadai on the north, Bahr-el-Ghazal on the east, Belgian Congo on the southeast, and the Atlantic Ocean on the west. Area, about 672,000 square miles; population, estimated in 1915 at 9,000,000. The resources, though undeveloped are extensive, including wild rubber and many valuable woods. Coffee is produced and palm-oil is to some extent exported. The population has been ravaged in late years by the sleeping sickness. In 1917 the exports amounted to 27,732,410 francs and the imports to 9,575,000 francs. Whale-fishing was begun in 1912. A considerable amount of shipping enters the chief ports of Libreville and Port Gentil. There is a telegraph line between Brazzaville and Loango, which communicates with the English Atlantic cable, the total telegraph line in operation being about 2366 miles. The budget for 1919 showed the following figures: General budget, 4,200,000 francs; colonial budget divided as follows: Gabun, 2,503,200 francs; Middle Congo, 2,587,311 francs; Ubangi-Shari, 2,315,000 francs; Chad, 3,725,000 francs.

It was divided in 1910 into the districts of Gabun, the Middle Congo, and the Ubangi-Shari colonies and Chad territory, to which after the war the German colony of Kamerun (q.v.) was added. In 1911 France ceded to Germany a part of her equatorial territory in return for German recognition of the French protectorate over Morocco, but this region was returned to France along with Kamerun. The colony is under the governor-general of Equatorial Africa and each of the divisions is under a lieutenant-governor and possesses an independent administration including an administrative council. The headquarters of the governor-general are at Brazzaville and he is assisted by a secretary-general and a council of government. There is a general budget for the colony as a whole, and there are separate budgets for each of its divisions. Governor-general in 1920, M. Augagneur.

In 1920 it was reported that the natives had suffered heavy losses from ravages of disease. At that time plans were made for improving the means of transport on the coast and in the in-

terior. In particular work was being pushed on the railway from Brazzaville to the sea, the only means of communication down to that time being the Belgian railway. The governor-general in 1920 was M. Augagneur.

FRENCH ESTABLISHMENT IN OCEANIA. A French colony in the Southern Pacific Ocean consisting of scattered groups and single islands. Total area, estimated at 1520 square miles; population, Dec. 29, 1911, 31,477; estimated in 1919 at about 81,200. Capital, Papeete, on the island of Tahiti. The main groups are the Society Islands, of which the most important are Tahiti and Moorea; the Marquesas Islands; the French Leeward Island; the Gambier, Tubuai, and Rapa groups of islands. Tahiti is celebrated for its fine climate and picturesque scenery. Its chief products are pearls and mother-of-pearl, and it produces, besides the grains and vegetables suited to temperate climates, a variety of tropical fruits. Its chief industries are the working of copra, rum, and zinc. The budget of the entire colony in 1919 was 3,879,000 francs. It is under the administration of a governor who is assisted by an administrative council.

Phosphate is produced in and exported from the Society Islands in considerable quantities. In 1920 nearly all of it was exported to New Zealand. Before the war much of it went to San Francisco, some to Europe, particularly France, and a considerable quantity to Honolulu. In 1919 the production was approximately 40,000 metric tons, and it is reasonable to expect that the production will rapidly increase.

The great difficulty encountered in this enterprise, as in all others in the colony, was that of procuring suitable labor. To meet this difficulty the French government has enacted a decree providing for the importation of foreign labor, and fixing the conditions of such importation.

FRENCH GUIANA (CAYENNE). A French colony and penal settlement on the northern coast of South America. Area, 34,069 square miles; population in 1918, 26,325; unofficially placed in 1919 at 49,231. Capital, and only seaport, Cayenne with a population in 1919 of 13,619. At the beginning of 1919 there were 24 primary schools with about 2000 pupils. The chief products are rice, corn, cocoa, coffee, sugarcane, indigo, manioc, tobacco, and gutta percha; and the chief industry is gold-mining of which the product in 1918 was 80,477 ounces. Silver, phosphate, and iron are also mined. Imports in 1918, 15,308,526 francs; exports, 15,821,697 francs. The exports were mainly cocoa, phosphate, gold, woods, and hides. At the beginning of 1919 the penal colony comprised 6036, of whom over 2000 had been freed. It is under a governor, assisted by a privy council and a council-general of 16 members elected by French residents. It sends one deputy to the French parliament.

FRENCH GUINEA. A French colony of West Africa, situated on the coast between Portuguese Guinea and the British colony of Sierra Leone. Area, about 93,000 square miles; population in 1917, 1,812,579, including 1166 Europeans, of whom most were French. Capital, Konakry, with a population of 6623. The chief commercial centre is Kankan. Other towns: Boké, Kindia, Dubreka. The chief product and export is rubber. Other products include palm-oil and palm-nuts, millet, gum, peanuts, and

coffee, and in parts of the country cattle are raised in abundance. Gold is found. No later figures for trade were available than those contained in preceding YEAR BOOK. There is a railway from Konakry on the coast to the Niger River and thence to Kankan, a total distance of 776 miles. There are cable communications with France, Pernambuco, and Liberia. In 1919 the budget balanced at 9,548,000 francs. In 1919, 124 vessels of 154,246 tons entered the ports and 121, of 161,426 tons cleared.

The total foreign trade in 1919 was valued at \$9,358,166 as against \$6,919,551 in 1918. The chief imports in respect to values in 1919 were cotton goods which were far in excess of any of the others and next came metal manufactures and tobacco. The leading exports in respect to value were palm kernels, rubber, and hides. In 1919 France and her colonies received 62.33 per cent of the exports and England 11.4 per cent. Of the imports, France and her colonies supplied 22 per cent.

The tonnage for 1919 was as follows: Vessels entered, 288,614; cleared, 293,750.

FRENCH INDIA. The name applied to five French dependencies in India, with an area of about 196 square miles, and population of 266,064. They are: Pondicherry, Karikal, Chandernagar, Malé, and Yanam. The government maintained in 1918, 61 primary schools and three schools with 312 teachers and 9676 pupils. The chief products are rice, sugar, cotton, coffee, cacao, manioc, and peanuts. Imports to the three ports in 1918 were, 14,289,071 francs, and exports, 15,886,384. Two hundred forty-one vessels entered the three ports in 1918. Budget, 1919, balanced at 1,963,500 rupees. The colonies are under a governor whose seat is at Pondicherry and they are represented in the French parliament by one senator and one deputy.

FRENCH INDO-CHINA. A French dependency in southeastern Asia, consisting of the following five states: Annam (52,100 square miles, with a population in 1914 of 5,200,000); Cambodia (45,000 square miles, with a population of 1,634,252); Cochin-China (20,000 square miles, with a population of 3,050,785); Laos (98,000 square miles, with a population of 640,877); Tongking (46,400 square miles, with a population of 6,119,720); also the leased territory of Kwangchow-Wan (190 square miles, with a population of about 168,000). Capital, Hanoi, in Tongking, with about 150,000 inhabitants in 1915. Other towns: Cholon, 191,665; Bindinh, 75,000; Saigon, 72,000; Pnom-penh, 54,621; Hué, 65,000; Vien-tiane and Haithong, 27,000 each.

Tongking in the northern part of Annam has mining and manufacturing as well as agricultural interests. Central Annam, which has as its general port, Tourane, is agricultural and produces for export cinnamon, tea, and sugar. Coal, lignite, tin, zinc, antimony, and wolfram are mined. The coal production in 1918 was 636,000 tons. Total imports in 1917, 373,555,560 francs; exports, 430,200,036. Rice formed about 70 per cent of the total exports. In 1919 the exports from Great Britain, which were chiefly cotton, amounted to £560,379. There is a railway from Saigon to Mytho. The total length of railway line was 1300 miles at the beginning of 1919, and two-thirds of this was owned by the government. Of the five states above mentioned, Cochin-China is a colony, and the other

four are protectorates. The whole dependency is under a governor-general, assisted by a secretary-general, and each of the states is under a resident superior, except Cochinchina which is under a governor. Cochinchina sends one deputy to the French parliament. Annam, Cambodia, and Laos are under local kings who govern under the direction of the French authorities. The whole of Indo-China has a common budget, and there is a separate budget for each of the states. At the beginning of 1920 the military force in the whole country numbered about 25,514.

Governor-general, in 1920, M. Long. The policy pursued by France has been in general to give the natives as large a share in the government as they seem capable of bearing. Although some criticisms were directed against the government and although it was asserted by certain objectors that French rule in that region was not likely to endure, the war seemed to prove that the French administration was firmly entrenched and that it had the confidence of the natives. France received from Indo-China during the war, not only an important contingent of troops, but large supplies of money, boats, provisions, and raw materials. After the war, the condition of the colony appeared to be prosperous. Under the administration of Governor-General Sarraut, the reorganization of the native judicial system had been begun, and in 1918, four codes had been promulgated, laying down the general and elementary principles that should guide the judicial administration. In 1920, more specific judicial reforms were projected, including the organization of Anamite courts, the regulation of the civil procedure, the issue of a penal code and a code of penal procedure. New legislation was projected, conforming to the necessities of the different parts of the colony. Much progress had been made in education, especially in primary education. The number of schools had steadily increased and the number of pupils had increased in proportion. A higher school of pedagogy was established to make up for the lack of European teachers and the first results of it were reported to be excellent. The administration of the higher education had already shown its efficiency. There is an Indo-Chinese university, including schools of medicine, pharmacy, law, administration, pedagogy, agriculture, public works, and veterinary science; and it was planned to add to these, schools of commerce, applied science, fisheries, and navigation.

FRENCH IVORY COAST. See **IVORY COAST.**

FRENCH LITERATURE. What will be eventually the trend of philosophical thought that will prevail in France recuperating from the war, it is not possible to say yet. But while many writers are already groping in all directions, many feel that first of all France ought to become as fully conscious as possible of what the war has meant for the country. And after two years during which the war was rather avoided in literature, owing to exhaustion and the need of mental rest from the long nightmare, we witness this year a renewed interest in matters pertaining to the four momentous years.

BOOKS ABOUT THE WAR. How the French feel about the war is well shown in books like the following, written by some of their masters of the pen: *Au bord du Gouffre*, by V. Margueritte,

a discussion of the five first weeks of the war, supporting by facts the theory of a terrible mismanagement of affairs, until one man who had kept his head cool, Gallieni, saw a chance to drive a wedge into the foe's army; Marius-Ary Leblond, *Gallieni parle*, the diary of the great chief by his two secretaries (with a volume of *Mémoires* by Gallieni himself); again, J. Bédier, *L'Effort français*, one of the most inspiring war-books showing in a sober but impressive way what the French army has achieved—not one battle scene, but with information of absorbing interest on the armaments, the drill, the new schemes for battle, the tactics; *Au G. Q. G.* (Grand Quartier-Général). The author of the last-named, Jean de Pierrefeu, is the man who, from 1915 until 1918, wrote out every day the official War Bulletin of the French army and no one knew more than he about the General Staff. His observations are at times in the note of genuine admiration, at times in a tone of biting sarcasm. Some critics have compared him to Saint-Simon. By no means of the same excellence is M. Boulenger's *La Cour*—also the G. Q. G.—although it received the Prix Stendhal.

Then there are new accounts of battles, either by outsiders, like Le Goffic's 3d vol. of *Histoire des Fusiliers Marins, Saint-Georges et Nieuport*; Madelin's *Verdun*, and *La Bataille de France (21 mars-11 nov. 1918)*; or diaries like Lorédan's *Lille et l'Invasion allemande* (when 3000 Frenchmen tried to hold back 80,000 Germans); and R. Fonck, *Mes Combats* (prefaced by Foch). We must name again here R. Dorgèlès' *Croix de Bois* (Prix de la Vie Heureuse) which was issued too late for full report in last year's YEAR BOOK. By general consent this will remain the book par excellence for an account of the hardships and the heroism of the soldier of the Great War, with no jingoism indeed, and yet with no morbid sentimentality degenerating into fanatic pacifism. Florian Parmentier's *L'Ouragan* is of the same order, and has been much praised. The tragically morbid note remains in several books which threw men like Barbusse into the arms of Bolshevism. Barbusse himself in *Lueur de l'Abîme* gives up discussing by 'romans à thèses,' and inveighs directly against present society. Around him are a group of men betraying the same tendencies, e.g. Raymond Lefebvre, *La Révolution ou la mort*; R. Lefebvre et Paul Vaillant Couturier, *La Guerre des Soldats*—a pale reminiscence of *Le Feu*. Less morbid is A. Mailliet's *Sous le front du Destin*, a sensitive character torn away from his peaceful occupations, but who finally sees a redeeming feature in war inasmuch as it emphasizes the idea of sacrifice of self to the welfare of all.

Other works in which war reminiscences are presented under cover of novels are: J. Giraudoux's *Adorable Clio*, recalling his days in the hospital of Châteauroux, and with more emotion than he had been willing to show in his well-known *Lectures pour une ombre*. Werth's *Clavel chez les Majors*, follows *Clavel Soldat* (1919). In the form of war-diaries we have Mad. Alphonse Daudet's *Journal de Guerre et de Famille*. P. Valdelièvre in *Les Bagnes d'Allemagne*, and Max Anglès in *La Geôle, Camp de Concentration* describes the terrible treatment of prisoners in Germany. Paul Adam's *Reims dévastée* came out posthumously; Merki also has a book on *Reims*. Muret publishes *Littérature Allemande pendant la Guerre*, and the diary of a German.

The number of *war novels* was considerably on the increase. L. Dumur's "Zolaistic" *Nach Paris* came out in book form and caused much comment (see *Mercur de France*). Claude Farère's *La Dernière Déesse* (War being the last of deities to humankind) is a novel of the sea reminiscent of his play *Veillée des Armes*. In H. Bordeaux's *Œuvre de Chair*—a problem war novel: A French officer becomes engaged to a charming Alsatian girl and before a battle in which he fully expects to die the two yield to their love; after the war the girl, with her child, looks up the mother of the officer who understands that everyday standards can not be applied to war circumstances and adopts the child. R. Rolland continues his pacifist apostolate in *Clérembault*. A. Erlande, *Vivre et mourir là, roman d'une Anglaise en France*; Birabeau, *Annette et son Américain*, and especially Marcel Prevost's *Mon cher Tommy*, deal with the same popular topic; the last-named, showing a refined French lady who explains her love for the plain little bank clerk appearing as aviator hero, is remarkable. J. des Vignes Rouges, *Sous le brassard d'Etat Major*; Odette Dulac, *Faut-il* (a case of love for a mutilated soldier); Mary Florian, *On demande une Marraine*; Edmond Cazal, *L'Inféconde*; de Coulomb, *Fiancée de Guerre* are of the usual type of novel; P. MacOrlan, *Rob Bataillonnaire* is an amusing roman d'aventure; A. Maurois has *Nouvelles aventures du Colonel Bramble*. We must mention two interesting historic war novels: J. de Givry, *Fatale Servitude*, the story of a woman who, against orders, follows her husband to the front, and he, having given up all hope of inducing her to leave, shoots her in order to conform to discipline; and Ch. H. Hirsch, *La Chèvre aux pieds d'Or*, the story of a beautiful dancer who is shot while acting as a spy for Germany. An allegorical novel by Henry Jacques, *La Veillée de la Lune*, was much read. Following Voltaire's style, he supposes an inhabitant of the moon landing on our planet during the war and genuinely reflecting on what he sees; he pities humankind for the poor use of its intellect.

On the stage also there is a revival of interest in the war: Brieux's *Les Américains en France* (Odéon,—also given in New York) contrasts, or juxtaposes the French and the American characters—but he deals especially with women characters. Despite the admirable qualities of the American woman so efficient in social work, the young Frenchman does not find in her the real love he expects from his mate in life. It is the same problem as Colette Yver's in *Les Cousins riches* less delicately dealt with. Other plays though by less famous authors have been more discussed, e.g. Georges Bourdon's *Les Chaines* wherein the hero who had been an internationalist before the war becomes convinced that his ideal was a dream, while his friend, a Russian woman, remains true to her former theories; and Ch. Méré's *La Captive* which discusses the same idea: A Neustrian woman has a son by a countryman, then from a second marriage with a Gallois, she has another son. A war breaks out and the two sons fight on different sides. After the war they meet by chance, both being wounded, speak of their sufferings, and fall in each other's arms. Edmond Fleg's *La Maison de Dieu* treats the old theme of Lessing's *Nathan*. The representatives of four different religious creeds meet under the tent and they love instead of hat-

ing each other—a very delicate play. M. Donnay, in *La Chasse à L'homme*, discusses the difficulty for women since the war to satisfy their true vocation of marriage: A young chambermaid and a young chauffeur, both of the upper strata of society but forced down the scale, meet, and finally marry. *Le Retour*, by R. de Flers and Croisset, was greeted with much applause: A very sedate man becomes a war hero, and his wife is delighted and treats him as a hero when he returns; but he wishes only to return to his peaceful life. His disappointed wife flirts with a young officer, but gradually is won back to the non-romantic and more reasonable life. Romain Rolland's *Liluli* was hailed as a masterpiece by some, but by general opinion was pronounced a bore and a failure, and moreover it was not meant to be represented: The Gallipoulets and the Hurluberloches fight, driven against each other by Llop'n (the deity *L'opinion*), to conquer Liluli (*L'illusion*) . . . and so the satire goes on. The same is true of another allegorical play, *La Tragédie des Empires*, by A. Erlande, which embodies the truism that the world empire is a dangerous dream. Paul Claudel seems to have lost his literary power; *Le père humilié* is a war play referring to 1870-71, but applying to the last war as well.

In poetry, let us first of all mention the fine *Livre Epique, Anthologie des poèmes de Guerre*, by Prevost et Dornier. André Lamandé was awarded the Bourse nationale de Poesie for his elegant volume *Sous le Regard clair d'Athéné*. Henri Céard's *Sonnets de Guerre* are among the finest war poems published in France. Cécile Perrin's *Les Captives*—that is the women who are the "captives" of their sorrows and their solitude—was very well received. A. Dujardin, in *Lille captive* offers a diary in verse of the four years of occupation. Drieux de la Rochelle aroused much comment in his *Interrogation* (what the war meant) and with his *Fond de Cantine*. The famous cubist, Blaise Cendrars published *J'ai tué*. Good collections are: Roger Allard, *Elégies martiales*; Fr. Baron, *Sous le Casque des Lauriers* (very human); R. Arcos, *Le Sang des Autres*; J. Moulat, *La Torche enflammée*; Richardot, *Le Tocsin avant et pendant la Guerre* (1891-1919); Séguret, *Poèmes*; A. Flory, *Un Cœur de brave*; Martins, *Poèmes d'Alsace*; Guillemard, *Vers pour mon frère* (mort 1914), Mad. Claude Ferval, *La Trace de ses pas* (her husband was killed in war).

On the Literature of the War, consult: Albert Schinz, *French Literature in the Great War* (from 1914-19) with bibliography and index (Appleton, N. Y.).

We come now to French Literature, independent of the war:

THE THEATRE. Some of the great successes of the year were: Albert DuBois, *L'Hérodiade* (Théâtre Français), the story of Titus and Berenice told so well by Racine; variously discussed by critics, but accepted by the public. *La Maternelle*, from the novel by Frapié (Prix Goncourt) saw its success grow every month after April. *La Mort enchainée*, indisputably the greatest success of the second half of the year (Théâtre Français) with de Max in chief part: The author, Maurice Magre, a believer in reason, employs mythological terms. Sisyphus, the hero, is presented as fighting superstition; he commits some terrible and impious act and challenges the gods to punish him; they send death; he suc-

ceeds in chaining death; but the woman he loves and who loves another man delivers death; and death kills Sisyphe—who comes back to announce that the world must go on living and believing. This drama (in verse) is reminiscent of Æschylus, of Brieux, and of the philosophers of the eighteenth century, but it was a success. In *La Maison sous l'Orage*, by E. Fabre (Odéon), a father divorces and has a second son; the two sons quarrel over business and love; the true cause of all the unhappiness is divorce. The author has strongly resented being compared to Bourget on account of the "morality of the play." Curel's *L'Ame en folie* is a psychological play demonstrating that love in man is primarily a physical phenomenon modified, organized, intellectualized by the mind. In Pierre Wolf's *Les Ailes brisées*, father and son love the same woman (as in Racine's *Mithridate*) and the father finally yields. In Bernstein's *L'Animateur*, a violent and unpleasant play, a girl has a great admiration for the man she believes to be her father and who is now divorced; an ill-intentioned person tells her the truth, but she remains with the man who was after all her "spiritual father." Maurice Vernes drew crowds for a long time to the Champs Elysées for his spectacular adaptation of the *Mille et une nuits* to the stage. Saint-Georges de Bouhélier had a success of scandal with his *Esclaves*, an uncanny evocation of the world of courtesans and apaches.

Beside these particularly successful plays, there was an incredible variety of production, variety both in form and content. Any classification is impossible. Pierre Frondaie's *L'Appassionata* is a drama in the world of artists which stirred the audiences of the Porte Saint-Martin. *Maître de son cœur*, by Raynal (Odéon) is a re-edition of Musset's *On ne badine pas avec l'amour*—only here it is a young man, not a girl, who dies of love. *Une faible femme*, by Jacques Deval, (Théâtre Femina) shows a woman who has been lured to live a fashionable life by marrying without love, and now feels humiliated in her conscience. Tristan Bernard's *Les Petites curieuses* is a very keen discussion of love (four characters only); the cynicism is a little surprising in this usually good-natured humorist. A. Birabeau's *La Femme fatale* is an amusing comedy of a woman who seems very plain and yet turns out to be a "femme fatale." *Paraître* by L. Verneuil is a subtle play written for Sarah Bernhardt so that she may play the part of an invalid boy. Ch. Méré's *Les Conquérants*, revives the Romeo and Juliet theme in the modern world of industrialists versus old nobility. In L. Verneuil, *L'Inconnu*, a man consents to be accused of theft in order to save the honor of a woman. Sacha Guitry, *Je t'aime*, ridicules bourgeois sentimentality. Arquillères, *La Branche morte*, is the story of two brothers, one highly successful, the other sinking to the lowest depths of humankind. Henri Marx's *L'Enfant maître* had a short but much discussed career at the Théâtre Vaudeville, the thesis being that adultery, if openly committed, may lose some of its opprobrium. Lenormand's *Les Ratés* is an interesting study of two artists who had come to believe in their superiority because they were not successful and only when dying of misery see the stupid illusion to which they fell victims. Mme. Aurel's *L'insociale* is a one-act play advocating free-love. Mme. Rachilde's *La Poupée transparente* deals with maternal insanity.

Georges Berr, the famous actor, gives a play on *Monsieur d'Assoucy*, a contemporary player of Molière. Gabriel Imbart in *Le Fruit défendu*, gives a witty representation of the scene in the garden of Paradise in which the serpent and the monkey have some caustic remarks to offer; while A. Dumas, in *Le Premier Couple* (Théâtre Français) gives a picture of the so-called golden age when women were common property, but there comes a day when one woman experiences a feeling of shame and revolt, which one man understands. Polti dramatizes some scenes of the *Roman de Renard, le Goupil*. Cocteau aroused much interest by an original pantomime production with music of a farce, *Le Boeuf sur le toit*. At the Cirque d'Hiver, Gémier started a series of "Spectacles de la Vieille France," the first being *La Grande Pastorale*, an old Provençal mystery play with pageant, by Ch. Hellem and Pol d'Estoc. Merely good comedies were: Nozière, *Les quatre coins*, and *Tour de Cadran*; Picard et Mirande, *Un homme en habit*; *La femme de mon ami*; Eon et Machard, *Les Potaches* (school boys) which aroused vigorous protest. Among modern plays produced at the Vieux Colombier let us mention *Phocas le Jardinier*, a Christian martyr pictured by, and in the style of, Francis Jammes. Some thought Mazaud's *La folle Journée* remarkable for its cleverness, others for its fatiguing quality. Vildrac's *Paquebot Tenacity* was a moderately original play of two friends loving the same girl; but people go to the Vieux Colombier more for the acting than for the play itself. Jules Romains's *Cromedeyre le vieil* is a picture of a village in the mountains, away from all civilization, prehistoric in its customs, with herds of beings rather than individuals. Duhamel's *L'Oeuvre des Athlètes* is a cruel satire of so-called artists who succeed in fooling the public and having them believe in the existence of genius where there is nothing but plain humbug. The man aimed at was said to be Barzun, not unknown in this country.

A play, by Taride and Fauré, based on the novel *Get Rich Quick Wallingford*, met with success.

Closet plays are: P. Claudel's *Protée*, a continuation of Æschylus's *Oresteia*. And by the same *L'Ours et la Lune*, a play for marionettes.

A subvention by the government for a Théâtre Populaire has been granted; provisionally they will be housed at the Trocadero, beginning 1921.

The *Revue bleue* of Oct. 16, 1920, has an article by Rageot, on *Paul Spaak*, the foremost Belgian playwright of the day.

POETRY. The reader especially interested in poetry is referred to the monthly review of poetry in the *Mercur de France*, or in such occasional reviews as those by Vandérem in *Revue de Paris*. Here we will mention only: Henry Bataille, *Quadrature de l'amour*—disappointing to critics who consider the attempt by the famous author to be "gouaillieur" on a topic that remains grave is a failure; Henry Ghéon, *Le Miroir de Jésus, Sur les 15 mystères du Rosaire* (illustrated by Denis); P. L. Fargue, *Poèmes, suivis par Pour la Musique* (the genre of Heine); Lucie Delarue Madrus, *A Maman*; Emmanuel Hache, *Paroles d'un amant*; Eug. Figuières, *La Forêt sans feuilles*; L. Fabre, *Connaissance de la Déesse*; A. P. Garnier, *Les Corneilles de la tour* (which gossip about the life and inhabitants of the village). By way of innovation the ladies of the literary court of La Vie Heureuse award-

ed their prize this year to a poet, Edouard Goyon (already a laureate of the French Academy) for *Le Jardin des Dieux* (which is Algeria; Goyon is a librarian at Algiers). The following are a few titles which give an idea of the ultra-modern schools: Cubism: André Salmon (the poet of *Féeries*, and of *Calumet*), *Prikaz*; Blaise Cendrars, *Du monde entier*; F. Cocteau, *Poesies*; Pierre Reverdy, *Guitare endormie*, and by the same author, a little manifesto for Cubism, *Self-Defense* ("Inexplicable ne veut pas dire incompréhensible"). Post-Cubism: Paul Moraud (who was taken in this country under the protective wing of the *Dial*) *Lampes à Arc*; Maurice Réval, *Le Réve*. Finally the newest of the new, Dadaism: Francis Picabia, *Pensées sans langage*, and *L'unique cunuque*. As an offset to these, see George Fourest, *La Nègresse blonde*, a satire on the believers in novelty at any cost.

THE NOVEL. If one judges from popularity Pierre Benoit remained king of French novelists; he added to his list, *Koenigsmark*, and *L'Atlantide*, a Spanish story in Spain, *Pour Don Carlos* (in which instead of one "femme fatale," there are two) and he announced a novel on *Utah, the land of Mormons*. Moreover he had the good luck to arouse a formidable literary quarrel (see below, under *Criticism*). Marcel Proust, the Goncourt Laureate of the preceding year with *A l'ombre des jeunes filles en fleurs*, continues to be widely discussed and issued the third novel of the series, *Côté de Guermantes*. As in the former novels, nothing out of the ordinary happens; nothing at all of importance is discussed; and there is no attempt at style, indeed the style is voluntarily unchastized,—and these characteristics were the very things that caused admiration. The new Goncourt laureate, E. Perochon, is a poor schoolmaster near Paris; his novel *Néne* (abbreviation for Madeleine), is the gloomy story of a farm girl who with the greatest devotion takes care of the children of her widowed master, but is rewarded with such heartless ingratitude that she finally drowns herself. Other novelists considered were: A. Salmon, *La négresse du Sacré-Coeur*; J. Vignaud, *Saratti le Terrible*; Mme. M. Vieux, *L'Enlaidie*. Two authors have come to the forefront, although well known already, because they were awarded important literary prizes: Edmond Jaloux (the author of *Sanguines*) receiver of the Grand Prix de Littérature Française, published *Incertaine* and *Au-dessus de la Ville*. The last-named is the story of a young woman who sacrifices herself to her invalid brother, a famous author, and rejects her lover, only to find that the sacrifice was unnecessary. This note of disillusionment is predominant also in André Corthis, *Pour moi seule*, for which he received the Grand Prix du Roman: A bright woman has the dullest sort of life with a hopelessly uninteresting husband, with not even enough energy to do evil. And there are many other fine novels betraying this disgust for unromantic life,—no doubt a reaction after the terrible but constantly dramatic years of the war. Thus, Lavedan's *Irène Olette*, first part of a trilogy to be called *Le Chemin du salut*: the heroine is a woman whom every man is ready to love; she fails to find her ideal, and finally marries a man whose interested designs she guesses easily . . . will that be the "road to salvation"? A. Hermant also works on a trilogy: *L'Aube ardente* picturing youth with its expectations, followed by *La Journée brève*, dealing with man in

his few best years, and the end will be *Crépuscule tragique*. Marie Audoux gives a continuation of *Marie-Claire*, in *L'Atelier de Marie Claire*, not a gay description of the life of the working girl, but with the sort of sadness about it that arouses at least the Aristotelian sympathy. André Lichtenberger's *Biche* is a girl who is made to suffer and finally die by parents who are not bad but stupidly good and severe. On the other hand, Maurice Rostand continued his attempts to become famous in spite of his father; his *Cercueil de Cristal* left far behind the Hamlet-like novels just mentioned; so much so that few critics took it seriously.

H. Bordeaux is, as usual, vigorously optimistic in *La vie recommence*. Henri de Régnier publishes one of his finest novels of delicately ironical psychology with *Pécheresse*, the same theme as the *Princesse de Clèves*, or Tinaire's *Maison du Péché*, only that the heroine is a Protestant woman and the suggestion of perversity associated unconsciously in her heart with purity of the flesh is more stressed. The same note of the unconscious perversity of woman is at the bottom of Claude Anet's *Ariane, Jeune fille russe* (not for the "jeunes filles"). Here may be mentioned also *Chéri* (first published in *La Vie Parisienne*) by the "redeemed" Colette. Altogether love reigns supreme again in literature, almost as if there had been no war: Marcel Prévost, *La nuit finie*—in the style of the early Prévost, shows the tricks love plays, especially with those people who have the most delicate feelings. Eugène Montfort's *Cœurs malades* is a curious transposition in our age and under European sky (Île de Houat, facing Quiberon) of the story of Paul and Virginia. Fr. Mauriac, in *Chair et Sang* is less dogmatically Catholic than he had been in former novels, but still considers that religion alone can offer salvation to young people when the storm of love threatens their adolescence. M. Tinayre again sings the triumph of love in *Perséphone*. André Gide's *Symphonie pastorale*, an ironical title for a *roman d'analyse*, in which the peace of a quiet parish house is shaken by a blind girl whom the pastor adopts out of charity and who falls in love with her benefactor. Fr. de Miomandre *La Cabane d'amour*, and J. L. Vaudoyer's *Le dernier rendez-vous* are delicate love stories by two favorite authors of the day. The titles of the following novels explain enough their content: Binet-Valmer, *Le Passion* (written before the war); Maurice Magre (author of *La Mort enchaînée*) *L'appel de la Bête*; Maurice Darin, *La Bête et l'Ange* (struggle between the male "bétise" and the female "ruse"). And once more women use the novel to abuse women: Marie Laparcerie, *La Fête est finie*; Madeleine Marx, *Femme*, the latter much discussed, highly praised in radical quarters and translated into English). Of the humorous style P. Reboux's *Romulus Coucou* is an example, a story of a disappointed love of a colored man for a white woman, . . . ending duly in lynching. Children occupy the first place in H. Bachelin's *Le Petit*; in A. Machard's *Les cent gosses* (dialogues chiefly); the adolescent in André Obey's *L'enfant*. See other titles of children novels in *Revue Bleue*, 10 avril 1920.

Quite an important group of novels is inspired by the desire to cater to the public which has still a taste for adventures—possibly an after-taste of the war—provided however they be not connected with the great war. We have already

mentioned P. Benoit. Then, P. Adam, *Le Lion d'Arras*, an American who arrives as a conqueror in an industrial district of France, and conquers also a charming girl. Louis Bertrand, *L'Infante* is a beautiful historical novel, the scene of which is romanesque Spain; the author of *Séviennes*, Gabrielle Réval, offers another novel of Spanish life, *L'Infante à la Rose*; J. J. Tharaud, in *Marrakech, ou Seigneurs de l'Atlas*, gives a striking picture of the proud bandits of the African desert; and J. H. Rosny has a new novel of prehistoric reconstruction, *Le Félin Géant*. Maurice Renard's *Le Docteur Lerne* is in the vein of Wells' *Island of Dr. Moreau*. At the same time Jules Romains, in *Donogon Tonka ou le miracle de la Science* ridicules science as a means of conquering the world; while A. t'Sterevens, in *l'Apostat*, ridicules the Utopians who swarm since the war, Fouriéristes, Tolstoists, etc. Pierre MacOrlan, the author, recently, of *Au bord de l'Etoile matutinal*, writes an amusing *Petit manuel du Parfait Aventurier*; Alex. Arnoud's *Indice 33* is a great roman d'aventure soldatesque, style of *The Three Musketeers*; and Maurice Dekobra, in *Prince ou Pitre* shows a prince who prefers to be a clown because then he can act more according to his own individuality. Jean de Bussy, in *l'Eau ardente* offers a strong anti-alcoholic plea.

Short stories: P. Bourget, *Anomalies*; Pierre Mille, *Trois Femmes* (much read); Boyslevé *Nymphes dansant devant les Satires* (Arétin is the hero of one of the stories, which explains the title); H. de Régnier, *Histoires incertaines*; Gaston Picard, *Confessions d'un Chat* (much discussed); Elisa Rhaïs, *Café Chantant* (striking exotism); René Bizet, *Peines de Rien* (a young man who made a hit); Tristan Bernard is as gay as ever in *Le Taxi-fantôme*.

CRITICISM AND LITERARY EVENTS. Except perhaps the lively controversy as to whether P. Benoit, in his *Atlantide* did or did not plagiarize Sir Rider Haggard's *She* (see *Revue de Litt. Comparée*, January, 1921); the rather violent attack by Lasserre, in *Revue universelle*, July, on the style of Proust, the Goncourt laureate of 1919; and the discussion about Flaubert between Thibaudet and Proust (the first claiming that Flaubert was a thinker, the second that he was exclusively an artist), nothing disturbed much the peace of the literary sky. Dadaism acquired some momentum in the course of the year and is taken by the public as merely a new step both in literature and in art, in the evolution of the futurism and cubism.

Work in the history of literature is proceeding now almost at the normal rate again. The following are a few of the newer publications: The last volume of the Edition municipale de Bordeaux of Montaigne's *Essais*; P. de Nolhac, *Les derniers amours de Ronsard*; a reprint of Ronsard's *Livre des Follastries* (1553); a new impression, at Strassburg, of d'Urfé's *Astrée*; J. de Bonnefon, *Port Royal-des-Champs*; Doumic, *Saint-Simon, La France de Louis XIV*; J. L. Marsan, *Beaumarchais et les Affaires d'Amérique*; Ducros, *Vie de Rousseau*, Vols. II and III; D'Arbelet, *La Jeunesse de Stendhal*, and two more volumes of the Champion edition of Stendhal's works; L. Estève, *l'Hérédité romantique* (condemned); G. Simon, *l'Histoire d'une Collaboration* (Alex. Dumas and A. Maquet); P. Sabatier, *L'Esthétique des Goncourt*; I. Rimbaud, *Mon frère Arthur*; Gohin, *L'œuvre de Samain*; R.

Ghil, *La tradition de poésie scientifique*; Soizat, *le Symbolisme de Baudelaire à Claudel*; Dujardin, *De Mallarmé au prophète Ezéchiel, essai d'une théorie de Réalisme symbolique*; F. Carco, *Poésie moderne*; A. Thibaudet, *Les idées de Ch. Maurras*. The *Revue des deux mondes* publishes "Nouvelles lettres de Balzac à l'étranger," and "Lettres de Brunetière au cardinal Matthieu." Albalat, *Souvenirs littéraires*. The *Library Journal*, of New York, November 15, published a list of the best French periodicals. The centenaries of Fromentin, Augier, and of Lamartine's *Méditations*, and the cinquantenaire of Mérimée's death were commemorated. The French Academy elected Bédier, Fiers, Chevillon. Among the dead are P. Adam, Lintilhac, Daniel Lesueur, and Réjane. Edm. Jaloux won the Grand Prix de Littérature; André Corthis, the Grand Prix du Roman (for *Pour moi seule*); Pérochon's *Nené* won the Prix Goncourt; and a poet, Edm. Gojon, won the Prix de la Vie Heureuse. The King of Belgium gave his approval to the foundation of a Belgian Académie de langue et de littérature française.

Excellent work is done for the knowledge of French Literature by the periodical *La France* (220 W. 42d street, New York) and by the Agence de Librairie, 29 E. 28th street, New York.

FRENCH SCHOLARSHIPS. See UNIVER-

SITIES AND COLLEGES.

FRENCH SOMALI COAST. A French colony situated between the Italian colony of Eritrea and British Somaliland, on the Gulf of Aden. Area, about 5790 square miles; population estimated in 1917, 206,000. The chief city is Djibouti which had in 1917 13,608 inhabitants, of whom 294 were Europeans. It is the main port and the seat of government. There is a considerable inland trade and the fisheries on the coast are of most importance. Salt is mined and is exported. Imports in 1918, 67,411,794 francs, and exports in 1917, 50,324,846 francs. There is a large trade with Abyssinia and the exports of Abyssinia pass through the port of Djibouti. Trade with Abyssinia formerly by way of Zailah has lately been by rail from Djibouti to Addis Abeba. The local budget for 1919 balanced at 2,370,300 francs. The colony is under a governor who is assisted by an administrative council.

FRENCH WEST AFRICA. A possession of France in western Africa composed of the following colonies and territories: Senegal, population in 1917, 1,144,621; Guinea, 1,812,579; Ivory Coast, 1,562,023; Dahomey, about 900,000; Upper Senegal-Niger, 850,094; Mauritania, 256,164; Upper Volta, a region formed out of the southern part of Upper Senegal-Niger, by decree of March 1, 1919, with an area of about 95,000 square miles and an indeterminate population. The total area is in the neighborhood of 2,000,000 square miles with a population of about 12,000,000 to 13,000,000. No later figures for commerce were available than those given in the preceding YEAR BOOK. The general budget for 1919 amounted to 33,732,000 francs. In peace times the military force numbered 13,500 of whom 1500 were Europeans, and the police force numbered 3000. The whole region is under a governor-general, whose headquarters are at Dakar, assisted by a council, and each colony is under a lieutenant-governor. There is a general budget for the whole country for the services common to all the colonies and there are separate budgets in each of

the colonies for their local needs. The Governor-General at the beginning of 1920 was M. Merlin, appointed in December, 1919.

Senegal is the oldest and most important of the above colonies in French West Africa. It lies to the north of the British colony of Gambia. There are superior technical schools, a normal school, a professional school, and other educational institutions at Dakar, and European culture has been extended considerably among the natives. The chief imports are cotton, food-stuffs, hardware, and coal, and the chief exports are peanuts, hides, rubber, and gums. The colony sends one deputy to the French Parliament.

French Guinea is situated on the coast between Portuguese Guinea and the British colony of Sierra Leone. Capital, Konakry. See FRENCH GUINEA.

French Ivory Coast, situated between Liberia and the British Gold Coast. Capital, formerly Bingerville, but in 1920 changed to Abidjan. The centre of education is Bingerville. Coffee and cocoanuts are cultivated, some gold is found, and mahogany is obtained from the forests. Vessels entering the ports in 1918 numbered 144 and had a tonnage of 228,877. The city of Abidjan is served by a railway 197 miles long and an extension of it was in process of construction in 1920. Telegraph lines connect the chief towns and extend to the adjoining colonies.

Dahomey extends from Togoland on the west to Lagos and Nigeria on the east, and northward to the French military territory. It has a coastline of about 95 miles. The products include corn, yams, potatoes, cotton, and palm-oil, and palm-kernels. The last two are the chief exports, along with corn and copra. There is a railroad from the port of Kotonu to Savé, a distance of 156 miles, and a new line was in process of construction in 1920. See DAHOMEY.

Upper Senegal-Niger lies to the south of the Algerian sphere. Capital, Bamako with a population of 8734. The products include peanuts, millet, corn, rice, cotton, cattle, rubber, gums, skins, and wool. There is a railway from Kayes to Koulikoro.

Mauritania was made a civilian territory in 1914. Its population consists chiefly of Moorish Mohammedans.

Upper Volta lies to the west of the river Niger and the Military Territory. Capital, Ouagadougou, with a population of 19,332.

The French West African government was authorized, under a law of Aug. 12, 1920, to contract for a loan of 167,000,000 francs for the construction of railways and improvements of port works in the French West African colonies.

FRIEDLÄNDER, ISRAEL. Jewish educator, killed by Bolshevik soldiers, July 5, while on a mission for the Joint Distribution Committee in the Ukraine. He was born in Russia, Sept. 8, 1876; educated at German universities; and was professor of Biblical literature and exegesis at the Jewish Theological Seminary in New York City. He was a member of many Jewish philanthropic and other societies, including the Jewish Distribution Committee of American Jewish Funds for Jewish War Sufferers. He published several treatises on Semitic philology and literature, translated Dubnow's *History of the Jews from the Russian*, and wrote *The Jews of Russia and Poland* (1915); *Past and Present* (1919), etc.

FRIENDS, RELIGIOUS SOCIETY OF. The Friends, commonly known as the Quakers, are

composed of four branches: Society of Friends (Orthodox) with about 100,000 communicants; Society of Friends (Hicksite) with about 20,000 communicants; Orthodox Conservative Friends (Wilburite) with about 4000 communicants; and Friends (Primitive) with about 100 communicants. The Society of Friends (Orthodox) is the largest and most active of these branches, and holds a Five Years' Meeting, quinquennial, composed of delegates from 12 of the 14 yearly meetings in the United States and one in Canada. The next Five Years' Meeting will be held in 1922 in Richmond, Ind. Special boards carry on the foreign and domestic missionary work of the denomination. The denomination supports nine universities and colleges, among which Haverford College, at Haverford, Pa., is the best known. The *American Friend*, and the *Friends' Intelligencer* are the best known publications. Headquarters of the society are maintained at Richmond, Ind.

The American Friends' Service Committee, which did such excellent work during the war, has continued to give aid to the afflicted peoples of Europe. At present there are about 90 workers in Poland fighting the typhus, and endeavoring to make the conditions more sanitary. In Vienna the Friends are establishing industries and trying to find work for the people. The Committee is anxious to start work in Russia and also in Mexico. Investigation of the conditions in Mexico is now under way, while military operations in Russia have so far prevented the admission of any workers. A call has been sent out for men and women to take jobs in this country among the prisons and the Indians. The work in Germany has been continued. At one time the Committee was feeding daily between 600,000 and 700,000 undernourished children in that country.

The Friends announce the gift of the Chalons Maternity Hospital, which was used throughout the war, to France, two Friends to be on the staff of the hospital permanently.

FRUITS. See HORTICULTURE.

FUEL. See CHEMISTRY, INDUSTRIAL.

FURS. See ALASKA.

GALDOS, BENITO PEREZ. See PEREZ-GALDOS, BENITO.

GALICIA. Formerly an Austrian province in the Austro-Hungarian Monarchy; bounded on the north by Poland, on the east by Podolia (Russia), and on the northeast by Volhynia (Russia); in the south it touches Bessarabia, and in the southeast it is separated from Hungary by the Carpathians. After the armistice its status was indeterminate, being one of the problems of the Peace Conference on account of the claim of Poland to Eastern Galicia. The Supreme Council decided, Nov. 21, 1919, to bestow Eastern Galicia on Poland under a mandate for a period of 25 years. This was subsequently modified by leaving the period of Polish control indeterminate. See WAR OF THE NATIONS.

GALLIENI, GENERAL. See FRENCH LITERATURE.

GALVAN, LUIS. Dominican diplomat, died at Washington, D. C., August 12. From June 24, 1918, to the time of his death, he was minister from the Dominican Republic to the United States. He had held various important posts in the diplomatic service, having been consul at Barcelona, Spain, the consul-general of the Dominican Republic in New York and at Madrid,

and chargé d'affaires at Washington. Though a young man he had already distinguished himself as a diplomat.

GAMBIA. A British colony and protectorate in West Africa at the mouth of the river Gambia. Area of the colony proper, four square miles; population, 800; of the protectorate, 4500 square miles, and population about 200,000. Capital, Bathurst on the island of St. Mary. In 1918 there were eight elementary schools aided by the government with an enrollment of 1481 and an average attendance of 371. The chief imports in 1918 were, aside from specie, cotton and cotton goods, and kola nuts, and the chief exports, aside from specie, were peanuts and hides. Over 93.8 per cent of the exports went to the United Kingdom, which contributed over 73 per cent of the imports. The total tonnage of vessels entered and cleared in 1918 was 282,066, almost all British; the revenue was £133,324, and the expenditure £88,703. Governor at the beginning of 1920, Sir Edward John Cameron.

GANGHOFER, LUDWIG. German author and playwright, died in Bavaria, July 25. He was born in 1855, the son of a celebrated Bavarian forester, and studied at the principal German universities. He published a volume of poetry in 1879 and in the following year wrote his first play in collaboration with Hans Neuert, *Der Herrgottschneider von Ammergau*, which won success on the stage and passed through many editions after publication. In 1881 two other dramatic successes followed: *Wege des Herzens* and *Der Anfang vom Ende*. This led to his appointment as dramatic writer for the Vienna Ringtheatre. He was one of the editors of the *Vienna Tageblatt* from 1886 to 1892. Among his later plays may be mentioned the following: *Der Besondere* (1890); *Die Fackeljungfrau* (1901); *Der Klosterjäger* (1892); *Die Martinsklause* (1894); *Der laufende Berg* (1897); *Das Gotteslehen* (1899); *Das Schweißen im Walde* (1899); *Der Dorfapostel* (1900); *Das neue Wesen* (1902); *Der hohe Schein* (1905); *Gewitter im Mai* (1905); also the plays *Der heilige Rat* (1912); *Die letzten Dinge* (1912); and *Der Wille zum Leben* (1913).

GARBAGE AND REFUSE. Utilization of garbage by feeding to hogs, long practiced more or less systematically and given a great impetus by war-time food conservation efforts, was continued during the year, but probably with considerable curtailment in cities where it had been taken up as a merely temporary measure. Feeding was continued in such large cities as Newark, N. J., Baltimore, Md., and Buffalo, N. Y., under the unique contracts noted in the 1919 YEAR BOOK, which yield to the city a price per ton for garbage delivered to the contractor based upon the average selling price per pound of live hogs on the Chicago market. Disposal by feeding was also continued in some other large cities, including Minneapolis and St. Paul, Minn., and St. Louis, Mo. Garbage utilization by reduction—for the recovery of grease and tankage, the latter being used as a fertilizer base—also continued in use in most of the large cities of the country that adopted reduction before the war and did not give it up for feeding to hogs under the influence of war conditions. At both Rochester and Syracuse, N. Y., municipal garbage reduction plants were under construction during the year, that at Syracuse being completed and put in operation. In each of these two cities

there had previously been a privately owned garbage reduction plant. At Toledo, Ohio, the city let a 10-year contract for garbage reduction at existing privately-owned reduction works. The city delivers the garbage to the plant and pays the company \$1.45 a ton for disposal and for washing the cans in which the garbage is collected and for maintaining about a mile of private road leading to the plant. Of two other bidders, one offered to pay the city \$1.26 for garbage delivered to a hog feeding plant 30 miles beyond the city limits and the other offered \$0.85 a ton for garbage delivered to a hog ranch 8 miles beyond the city boundary, but the city considered that the cost of haulage by truck and trailer equipment, particularly over country roads in winter, made the bid for reduction more advantageous. Philadelphia decided, late in the year, to take possession of the privately-owned garbage-reduction plant on Jan. 1, 1921, and to collect garbage, ashes, and rubbish in the two central districts of the city, the latter as a step towards the possible complete assumption of municipal collection after 40 years of contract work. Apparently few garbage incinerators or destructors were added to those previously in use, but a few small ones were built or contracted for. Toward the end of the year serious problems arose in connection with the future of garbage utilization both by feeding and by reduction. These difficulties were due to the sudden slump in the selling price of the grease from the reduction plants and of the hogs from the feeding plants almost to pre-war prices, while at the same time there was comparatively little reduction in the cost of the various supplies and the labor entering into garbage disposal. The reduction plants suffered more than those where feeding was practiced, owing to the much higher operating costs of the former. The reduction plants require for their operation large amounts of coal and of gasoline or other solvent besides much labor. There was comparatively little fall in the prices of these three elements in garbage reduction up to the end of the year. Those garbage disposal contractors whose contracts are on the sliding scale basis suffered less than those who were operating on a lump-sum plan—this is the case with nearly if not quite all the reduction contractors. Toward the end of the year the company having the contract for the disposal of the garbage of Boston by reduction offered to pay the city \$100,000 (the amount of its surety bond) if the city would cancel somewhat less than the remaining two years of the contract. The city not agreeing to do this, the company notified the city late in December that it would abandon the contract and shut down its work on December 31. It was expected that the city would take charge of the reduction works and sue the contractor for failure to fulfill the contract. Garbage disposal by incineration was also adversely affected by prevailing high prices but in the United States almost without exception garbage disposal by burning yields no revenue. Some 30 destructors of the British high temperature type have been built in the United States and Canada and most, if not all, of these have been provided with boilers and other equipment for generating steam in order that—as is common in Great Britain—the waste heat from the high temperature destructors may be used to produce steam which in turn will generate electricity or pump water or sewerage. The steam is used for

all three purposes in England, though most commonly for generating electricity. In the United States almost if not quite the only places where any considerable amount of refuse destructor heat is utilized commercially are Savannah, Ga., where steam is piped to the closely adjoining water-works pumping station, and at Milwaukee, Wis., where the steam drives turbines which generate electricity which is transmitted to a pumping station connected with the city sewerage system. In Canada, at Westmount, Que., refuse destructor heat is used at the electric light plant. Most of the American garbage burning plants are of the medium or low temperature type which, though requiring less capital for construction than the high temperature type, produce no heat for utilization. In view of the conditions outlined in the foregoing statements, the garbage disposal at the close of 1920 was beset with uncertainties. The future of construction and operating costs could not be predicted with confidence, but the indications were that they would remain high, regardless of the system of disposal, for some months, if not for a few years. The revenue from the two utilization processes had fallen heavily and under American conditions there is hardly any revenue from incinerating or destructor plants. Consequently the argument was for slowness in making changes in systems of garbage disposal that were giving a fair degree of satisfaction and, where the construction of a new plant seemed imperative, that the method chosen should be the one that would produce sanitary results at the lowest outlay and operating costs, taking into account the possibilities of revenue to offset a part of the total annual expense. If a new plant were decided on, indications were that garbage disposal by feeding to hogs should receive careful consideration. Feeding produces a revenue to help offset cost and requires a capital outlay below that for a reduction plant; moreover, the greater part of the capital investment is liquid or can be turned into cash by the sale of the hogs whenever for any reason this method of disposal has to be given up. Engineers engaged in garbage and refuse collection and disposal studies and in the collection and disposal of ashes and miscellaneous refuse as well, gave much attention during the year to the use of motor vehicles instead of horsedrawn vehicles for collection and also to the possibility of the employment of both, using horsedrawn vehicles for house-to-house collections from which the horses could be detached in order that the loaded wagons might be drawn by tractors to the point of either final disposal or the shipping station for transfer by rail to the disposal works. The consensus of engineering opinion still is that for house-to-house collection motor vehicles are not usually economical but that in many places they may be advantageously used for long hauls after the garbage has been gathered from houses and transferred at central loading stations. Where garbage is utilized, either by feeding to hogs or by reduction, it is important that all the garbage produced in the community be available for this purpose, especially the richer garbage from hotels, restaurants, and apartment houses. The right of municipalities to compel householders and hotel and restaurant proprietors to turn over their garbage to the city or to a contractor collecting the garbage for the city is often resisted, especially in the case of the richer garbage from hotels and restau-

rants which can be sold to various private collectors. During the year the State Supreme Courts of Missouri, Michigan, and Utah sustained the validity of contracts for garbage disposal that entitled the contractor to all the garbage produced in the city, thus overruling the contention that the garbage in question was private property. The cities involved are Joplin, Mo., Grand Rapids, Mich., and Salt Lake City, Utah. Abstracts of the decisions were given in "Public Health Reports" (United States Public Health Service, Washington) for May 28, June 4, and June 18, 1920. In the Grand Rapids case, the Supreme Court held, according to the abstract already cited, "that the city had the right to regulate the disposal of garbage and the plaintiff was compensated for any loss in the common benefit secured by the ordinance." Under an ordinance passed by the city council of Seattle during the year the city reserves to itself the exclusive right, either for itself or authorized agents, to collect garbage within the city. The ordinance authorizes the board of public works to let a contract for garbage collection and disposal for any portion of the city for a period of not over five years. The ordinance was regarded as essential to give the city control over hotel and restaurant garbage, both as to collection and to disposal, the latter on hog ranches.

Details of experience with the operation of several plants for the utilization of garbage may be found in *Engineering News-Record* during the year 1920, as follows: A summary of the first year's operation of the reduction plant at Washington, D. C., under municipal ownership, May 6, and a second article on garbage disposal in Washington, December 2; experience with feeding garbage to hogs at Salt Lake City, written by the president of the contracting company, May 13; a detailed statistical summary of nine years' operation of municipally owned garbage reduction works of Columbus, Ohio, November 18. See also the same journal for December 16th for an account of experience with rubbish collection at Washington, D. C.

GARDENING. See HORTICULTURE.

GARLAND, MAHLON M. Congressman, died at Washington, D. C., November 19. He was born at Pittsburgh, Pa., May, 1856, learned the trade of iron worker, and was president of the Amalgamated Association of Iron, Steel, and Tin Workers from 1891 to 1898. In 1898 he was appointed Collector of Customs at Pittsburgh and was subsequently reappointed to that office, but resigned in 1915. He was a member of the Select Council of the city of Pittsburgh and of the city school board, and he was member of Congress, 1915-19. In politics he was a Republican.

GARRIGOU, FELIX. French physician, died at Toulouse in the spring. At the time of his death he was professor in the faculty of medicine and director of the Institute of Hydrology in that city. He had devoted a large part of his life to the study of the mineral waters of France and the exploitation of the warm baths. His writings on the subject were regarded as authoritative and were crowned on several occasions by the Institute and by the Academy of Medicine.

GARTHE, LOUIS. Newspaper correspondent, died at Washington, D. C., September 8. He was born at Baltimore, Md., Sept. 10, 1861; graduated at Baltimore City College, 1879; and studied afterwards at Johns Hopkins University. In 1888 he established the New York Bureau of

the Baltimore *American* and spent six months of that year abroad. He was the representative of the *American* in Washington. After 1899 he was frequently dispatched on missions for the paper in Cuba and South America and for work in the national campaigns. His newspaper work covered a wide range and was very voluminous.

GARVEY, EUGENE A. Roman Catholic bishop, died at Altoona, Pa., October 22. At the time of his death he was bishop of the Altoona diocese which office he had held since 1901 when the diocese was created. He was born at Carbondale, Pa., Oct. 6, 1845, and graduated at St. Charles Seminary, Philadelphia. After officiating in the towns of Hawley and Athens, Pa., he became pastor at Williamsport, Pa., in 1871, and continued to officiate until 1899.

GARVICE, CHARLES. British author, died at Richmond, March 1. He was born in 1833. He wrote for the newspapers for many years but finally discovered a remarkable ability for writing popular stories and in 1898 published his first novel, *Just a Girl*, which became one of the most popular stories of the day. His works were not of a high literary quality, but caught the mood of the moment and were immensely successful. He also wrote a volume of poems and a play, *The Fisherman's Daughter*, which had some success. Among his other novels may be mentioned: *In Cupid's Chains*; *Love Decides*; *Linked by Fate*; *A Girl of Spirit*; *The Gold in the Gutter*; *Queen Kate*; *Two Maids and a Man*; and *The One Girl in the World*.

GARY, JAMES ALBERT. Postmaster-General under President McKinley, died at Baltimore, Md., October 31. He was born at Uncasville, Conn., Oct. 22, 1833, and studied at Allegheny College, Pa. In 1861 he became his father's partner in the manufacture of cotton duck and was the head of the firm from 1870 until a short time before his death, when he turned over the business to his son. He was nominated by the Whig party for the Maryland Senate in 1858 and he was delegate to the Republican National conventions from 1872 to 1896 inclusive with the exception of the convention of 1888. As Postmaster-General during the greater part of McKinley's term he introduced the movement for the establishment of postal savings systems.

GAS WORKS. See MUNICIPAL OWNERSHIP.

GASZTOVITT, WENCESLAS. Polish patriot and teacher, died in France in the spring. He founded the *Polish Bulletin* in France and continued to edit or contribute to it for 46 years. He was known as the most Polish of the French, and the most French of the Poles, and he did much to promote good will between the two countries during his long career. He was said to have been particularly fortunate in his prediction of the future. He taught for many years at the University of Sorbonne where he conveyed to the French student a knowledge of Polish literature by means of translations. He took part in the Polish insurrection of 1863, and he fought for France in the war of 1870. He always believed in the ultimate restoration of Poland, often quoting the lines of the poet on the subject of Poland to the effect that no nation died unless it wished to die.

GATES, ELLEN M. HUNTINGTON. American hymn writer, died in New York City, October

20. She was born at Torrington, Conn., about 1834 and married Isaac E. Gates whom she survived. Among the best known hymns that she wrote were those entitled *Eternity* which was translated into many languages and is said to have been the favorite hymn of President Lincoln; *The Home of the Soil*, and *The Prodigal Child*. She also published the collections, *Treasures of Kurium* (1897) and *To the Unborn Peoples* (1910).

GAYLEY, JAMES. Manufacturer and metallurgist, died, February 25. He was born at Lockhaven, Pa., Oct. 8, 1855, and graduated in engineering at Lafayette College, subsequently receiving degrees from the universities of Pennsylvania and Lehigh. After serving as manufacturing chemist and as superintendent of blast furnaces he became a managing director of the Carnegie Steel Company, holding that office until April 1, 1901, and was then made first vice-president of the United States Steel Corporation (1901-09), having charge of shipping and transportation. He invented a number of important devices in metallurgical work and received a medal for the invention of a dry air blast. He was director or member of various important manufacturing and scientific institutions, and was president of the Institute of Mining and Engineering.

GEMS AND PRECIOUS STONES. The great prosperity evident in the United States in 1919 had its effect in the production and importation of various gems and precious stones, which later of course felt the deflation and turn of the commercial tide in 1920. In 1919 there were imported into the United States precious stones and pearls valued at \$105,273,543 and in the first nine months of 1920 the demand continued with but slight decrease so that the imports were valued at \$63,185,739 or a larger amount than in any previous similar period with the exception of 1919. In fact only imports of diamonds and pearls decreased, as the other precious stones increased by nearly \$4,000,000. Inasmuch as 95 per cent of the world's diamond production was controlled by the De Beers Mining Company the output was very sensitive to the slackened demand and production was curtailed rather than prices lowered. The production of pearls was showing a natural decrease and as a result any marked decline in values of these and other precious stones did not occur in 1920 and was not anticipated later. The conditions in the diamond industry have been referred to elsewhere (see DIAMONDS), but there were also interesting developments as regards other precious stones which were summarized by George F. Kunz of New York in a brief but comprehensive review for the Annual Number of the *Engineering and Mining Journal*. According to Mr. Kunz sapphires were in greater favor in 1920 and brought higher prices than ever before. In the previous 20 years the United States had been a factor in their production and some \$2,000,000 worth of sapphires had come from Montana. Queensland, Australia, and Burma also produced many sapphires. The Burmese mines continued to supply the bulk of the world's rubies. Two new gem minerals aroused increased interest in 1920. Scapolite, yellow, transparent, and of gem quality, was found by Lacroix, together with beryl, euxenite, and monazite, in a potash-pegmatite at Tsarasaotra, Madagascar. Fibrolite (sillimanite), susceptible of being cut into gems, was

found in Burma and Ceylon. A new and interesting find of precious turquoise was announced during the year from Argentina. Jade, the rich green variety of jadeite from Burma, in 1920 was mined to a greater extent than previously and figured in much jewelry. California as usual, produced a number of the minor gems, such as tourmaline, kunzite, and beryl. A new and promising opal field discovered in 1915 at Stuart's Range, South Australia, and in 1920 still another good field which was found in Tintenbar, not far from Sydney, New South Wales provoked interest. In the United States the opals from Nevada, having a large water content, were chiefly of value as mineralogical specimens.

GENETICS. See ZOOLOGY.

GEOGRAPHICAL SOCIETY, AMERICAN.

A society organized in 1852 for the furtherance of geographical research. From November, 1917, to December, 1918, the Society was the headquarters of the body of experts known as the Inquiry, which later attended the Peace Conference and served on the various territorial and economic commissions. In 1919 the Society conducted an economic survey of the boundary between Guatemala and Honduras, which governments desired a technical study to be made as the basis for a recommendation by the Secretary of State for a final boundary in the disputed region. In 1920 the Society adopted as the chief part of its programme a plan of intensive research in the geography of Hispanic America. The results will include monographs, articles, hand books, and maps; and among the last named is the millionth map of Hispanic America in approximately 100 sheets. A feature of the year was the awarding of the David Livingstone Centenary Medal to Dr. Hamilton Rice. The Society publishes a quarterly magazine, the *Geographical Review*. It is a scientific periodical, giving the latest information in the fields of geographical research and exploration. It also contains a record section dealing with the geographical events throughout the world, and a review section covering the whole field of geographical literature. In addition, the Society publishes a Research Series consisting of monographs, of which normally one each year is sent free of charge to each Fellow of the Society. The officers for 1920 were: President, John Greenough; vice-presidents, James B. Ford and Philip W. Henry; foreign corresponding secretary, C. Redmond Cross; recording secretary, Hamilton F. Kean; treasurer, Henry Parish. The Society has its headquarters at Broadway and 156th Street, New York City, and Dr. Isaiah Bowman is the director.

GEOGRAPHIC SOCIETY, NATIONAL. A national scientific organization, with headquarters in Washington, D. C., founded in 1888 "for the increase and diffusion of geographic knowledge." The former is done through its expeditions and the latter principally through its organ, *The National Geographic Magazine*. During the year 1920 its principal scientific undertaking consisted of a reconnaissance survey of the Chaco Valley, N. Mex., the most densely populated portion of North America in pre-Columbian times. The purpose of this survey was to determine the advisability of a complete archaeological survey of that important centre of primitive Pueblo culture. In the Chaco Cañon are located the vast communal houses of Pueblo Bono and Chetro Kettle, around which are significant remains showing that the Pueblo Indians developed pot-

tery and other arts to their highest point. The scientific members of the sixth expedition to the Katmai, Alaska, region, under the leadership of Prof. Robert F. Griggs, presented their reports to the Society. One of these, made in conjunction with the Geophysical Laboratory of the Carnegie Institution of Washington, points to a possible revision of our present knowledge of the forces of vulcanism. It shows that in the great Katmai eruption the lava had a temperature of less than 1000° C. as it rose to the throat of the volcano; that this lava did not flash up in explosive form immediately on reaching the surface of the earth; but that it first brought to a molten state perhaps a cubic mile of rock in the mountain, after which came the terrific explosion. The problem of accounting for the vast accessions of energy necessary for the observed transformation has not yet been solved, but it is being pursued with vigor by the Society's representatives. Studies were also continued with reference to the revegetation of the raw mineral "soils" thrown out by the volcano, in the hope that they would throw light on the problems of soil biology of much importance to practical agriculture. The zoologist of the expeditions, Prof. James S. Hine, secured a very extensive collection of insects in Alaska, many species new to science being represented among them. The Katmai expeditions also discovered a spacious haven, which was named Geographic Harbor, in an area shown on the last chart as dry land. This harbor affords easy access to the New Katmai National Monument with its remarkable Valley of Ten Thousand Smokes. In the country north of the park four large and beautiful lakes, ranging from 3 to 30 miles in length, were discovered and named Lake Grosvenor, Lake Coville, Lake Brooks, and Lake Grant. The Society made possible the erection in Arlington National Cemetery of a permanent monument to the memory of Admiral Charles Wilkes, the discoverer of the Antarctic Continent. The grave of America's foremost South Polar explorer was hitherto unmarked. During the year the home study course of current events geography was extended through the newspapers until it now reaches 12,000,000 people. This course is translated into 17 languages through the Bureau of Foreign Language Information Service of the American Red Cross. In addition thereto, in coöperation with the United States Bureau of Education, the Society is furnishing current events geography material to 70,000 teachers and through them to 3,000,000 school children. The service has also been extended so as to provide for similar material on Bible lands, to serve as a background of information for the Sunday schools and Bible classes. The visual educational activities of the Society included the publication of a large number of pictorial geography sets, some 12,000 of which were distributed among the schools of the country. The membership of the Society is now approximately 750,000, making it numerically the strongest scientific organization in the world. Its president, Rear-Admiral John E. Pillsbury, having died Dec. 30, 1919, Gilbert Grosvenor, formerly director and editor, was elected president.

GEOLOGY IN 1920. The year 1920 was not marked by any startling developments affecting the principles of geology, but on the other hand, the public interest was unusually keen on geological matters and this is undoubtedly one of the important items in the history of the science

for the year. This interest was chiefly concerned with the oil supplies of the world and in particular with those supplies available for the United States. A large part of the interest was undoubtedly inspired by the statements of George Otis Smith, Director of the United States Geological Survey, who repeatedly placed before the public the precarious situation in respect to future supplies of oil. He emphasized the fact that upon the geologist depends the discovery of new supplies necessary to maintain production at its present rate. To meet the needs of the increasing demand for petroleum products, new fields must be discovered. Sources for such an increased supply were not considered as likely to be found within the United States as in foreign lands. Hence the most enterprising oil companies were investigating foreign fields, notably those around the Caribbean coast and in Peru, in South America, and the Mesopotamian, Persian, and Baluchistan regions. The political situations in these latter regions and in particular the endeavors of Great Britain to obtain exclusive control of them led to diplomatic correspondence between the United States and Great Britain which, among other things, stimulated the public interest in this branch of geology.

A very apparent though not wholly desirable reaction produced by the enhanced appreciation of the value of the geologists' services was the large number of resignations of geologists of the United States and other geological surveys. These men left the survey to take positions as oil geologists at greatly enhanced salaries. The survey was not alone in its experience but shared its loss with the college and universities, many of whose teachers of geology turned from the academic to the commercial world because of the enormous discrepancy between the salaries offered to men of like ability in the different spheres. This diversion of scientists to commercial work was undoubtedly immediately beneficial to the industry that employed them, but it created a very serious dearth in the supply of teachers. Even the future supply was threatened. This dearth should not be charged against the industries but against the public, which tacitly admitted, as measured by the relative salaries, that the man who can teach others to do important things is performing a less valuable service, though usually more arduous and exacting, than the one who serves private interests. In the past the discrepancy in favor of the commercial income was not so great as to counteract the attractions of academic life and opportunity to engage in research and publish the results of one's labors. The new public interest, coupled with the pressing demand of business, increased the number of students turning toward geology, thus overburdening the already reduced teaching forces. Nearly all, however, looked to the commercial or economic side and the natural source of supply for able teachers and research men was not kept up in the past year. Many excellent university positions for young men were either not filled at all or were temporarily filled by mediocre men.

The year was marked by the publication of a few important books. Perhaps the most important of these was Grabau's *Principles of Salt Deposition*. This is now the most exhaustive treatise on the origin and distribution of saline deposits and related substances. The vast importance of salt occurrences was brought home

to the general public by the straits in which the world found itself owing to the German control of potash during the war. The book therefore was very timely besides being comprehensive and thorough.

Another book of unusual interest was *Political and Commercial Geology and the World's Mineral Resources*, edited by J. E. Spurr. This book gives a *précis* of the geographic distribution and the commercial and political control of the world's mineral resources. The fortunate position of the British Empire in respect to the control of the supply of certain key minerals such as tin, gold, asbestos, and nickel is well brought out, as well as the unique position of Germany in regard to potash. In most respects the situation of the United States is shown to be commanding. She is well supplied with vast resources of the useful metals such as iron and copper and has the greatest reserves of coal. The book is a most admirable reference as to the political control of the world's mineral resources and supplies the public with another outlook on the territorial disputes that had arisen at the conclusion of the world war.

Two text books on physical and dynamic geology appeared. The first was the second edition of Part I of Pirsson and Schuchert's *Text Book of Geology*. While maintaining all its virtues of concise and lucid statement, which made it so desirable a medium for the instruction of the elementary student, much new material was added and the errors that disfigured the original edition were eliminated. The revision appeared posthumously, Professor Pirsson having died Dec. 8, 1919, leaving American geology impoverished by the loss of a very eminent petrographer and a highly successful teacher. The other textbook was Grabau's *Text Book of Geology*, Part I, "General Geology," which came out in December. A more exhaustive treatment than Pirsson's removes this book from the class of elementary textbooks and places it among such as Geikie's textbook and of Haug's and de Lannay's treatises on geology. In periodical literature mention must be made of Barrell's posthumous memoir on the "Piedmont Terraces of the Northern Appalachians" (*A.J.S.*, April-June 1920), in which Barrell supports the thesis that the terraces were produced by marine planation and are not fluvial peneplains. Aside from the great interest in the problem as a study in regional physiography, the memoir was of extreme importance for its discussion of the principles involved in the interpretation and the competence of the forces postulated, as presented by one of the most profound and brilliant of modern geologists.

In the *Journal of Geology* there continued to appear T. C. Chamberlin's articles on "Diastrophism and the Formative Process." These papers were an elaboration of the planetesimal hypothesis. The articles are of world-wide interest because they treat of the most profound principles and are written by the best-known and ablest of the present-day philosophical geologists. Among other misfortunes American Geology has to record the loss of J. P. Iddings, her most illustrious petrographer, a pioneer and one of the foremost of the authorities on igneous rocks in the world.

GEORGETOWN UNIVERSITY. A Roman Catholic institution of the higher learning at Washington, D. C., founded in 1789. For the fall session of 1920 there were 2143 students en-

rolled. The faculty numbered 231. The library contained 120,000 volumes. It is under the direction of the Jesuits. The recent gifts are as follows: \$30,000, a Morgan endowment for the Department of American History; \$40,000 for the Riggs Building of the Georgetown University Hospital given by Francis and T. Laureson Riggs. A new school of Foreign Service has been formed, and various new courses have been instituted. President, John B. Creeden, S.J., Ph.D.

GEORGE WASHINGTON UNIVERSITY.

A non-sectarian co-educational institution of the higher learning, at Washington, D. C., founded in 1821. For the summer session of 1920, there were 1054 students enrolled and for the fall session 2545. The teaching staff numbered 249. The endowment of the university amounted to \$457,636 and the income for 1919-20 was \$460,169. There were 55,000 bound volumes in the library and 10,000 pamphlets. A new Law School building was purchased and equipped during the year. President, William Miller Collier, L.H.D., LL.D.

GEORGIA. POPULATION. According to the preliminary report of the census of 1920, there were 2,895,832 residents in the State, Jan. 1, 1920, as compared with 2,609,121 in 1910.

AGRICULTURE. According to the census of 1920, the number of farms was 310,737, an increase of 6.8 per cent since 1910. The following table is compiled from the estimates of the United States Department of Agriculture, covering the years 1919 and 1920:

Crop	Year	Acreage	Prod. Bu.	Value
Corn	1920	5,100,000	76,500,000	\$80,325,000
	1919	4,820,000	69,890,000	111,874,000
Oats	1920	550,000	11,550,000	12,474,000
	1919	500,000	10,000,000	11,500,000
Wheat	1920	211,000	2,110,000	5,064,000
	1919	240,000	2,520,000	6,228,000
Rye	1920	29,000	290,000	609,000
	1919	33,000	294,000	800,000
Tobacco	1920	26,700	16,020,000	5,927,000
	1919	31,000	16,430,000	3,532,000
Hay	1920	672,000	6771,000	18,052,000
	1919	612,000	6673,000	17,068,000
Rice	1920	1,100	29,000	65,000
	1919	1,200	29,000	80,000
Peanuts	1920	224,000	7,616,000	9,368,000
	1919	202,000	5,050,000	12,423,000
Potatoes	1920	22,000	1,628,000	3,386,000
	1919	23,000	1,610,000	3,494,000
Sweet Pota.	1920	148,000	13,764,000	13,351,000
	1919	142,000	13,064,000	14,370,000
Cowpeas	1920	110,000	990,000	2,148,000
	1919	220,000	990,000	2,376,000
Cotton	1920	4,958,000	1,400,000	107,000,000
	1919	5,220,000	1,660,000	297,056,000
Sorg. Sirup.	1920	15,000	1,410,000	1,466,000
	1919	16,000	1,472,000	1,501,000

a Pounds. b Tons. c Bales. e Gallons.

See AGRICULTURAL EXPERIMENT STATIONS.

EDUCATION. In 1918 the enrollment in the public schools was 679,747 and the average attendance 452,064; teachers numbered 15,172.

TRANSPORTATION. The total railway mileage was 7436.

FINANCE. According to the latest available figures, the budget was \$9,500,000 and the net debt, \$5,718,202.

GEORGIA, REPUBLIC OF. Formerly a part of the Russian Empire; in 1920 an independent republic; situated in Transcaucasia between the Black and Caspian seas, bounded on the north by the Caucasus, on the east by Azerbaijan, on the south and southwest by Armenia and Turkey; capital, Tiflis. It is divided into nine provinces of which the total area is 35,000 square

miles, with a population in 1915 of 3,176,156. The chief cities are Tiflis, 346,766; Kutais, 85,151; Sukhum, 61,974; Batum, 25,020. Elementary instruction is free and compulsory from the ages of five to 11. There is a university at Tiflis, founded in 1918, which has six faculties, namely, medicine, philosophy, law, agronomy, literature, and science. It had 45 professors and 1500 students (1919). The chief interest is agriculture and the chief products include wheat, barley, cotton, corn, tobacco, tea, and wine. The wine industry is especially important. The country is well adapted for cattle-breeding and the livestock is plentiful. Among the minerals produced are copper ore, coal, naphtha, lead, zinc, manganese ore, iron ore, and sulphur. The manganese industry is the most important. The following report on conditions in 1920 was supplied by the United States Bureau on Foreign and Domestic Commerce:

PRODUCTION. The population of Georgia is divided into three classes: (1) The remnants of a feudal aristocracy (the well-known Caucasian princes, the title "prince" being a translation of the Russian word "knyaz," or chieftain, denoting in general practice a landholder); (2) the bourgeoisie of the towns, principally shopkeepers and merchants, most of those in Tiflis being of the Armenian race, though Georgian merchants do inhabit the smaller towns; (3) a peasantry largely of Georgian stock, engaged in agricultural pursuits and the raising of sheep and cattle. While this population is more or less racially solid in character, the Georgians are divided into a number of separate tribal stocks, each of which has its peculiar customs and in some cases its distinct language. The principal groups are Georgians proper, Mingrelians, Ossetines, Hevsurs, Abkhazians, and Emertines. Of these the Emertines constitute the largest racial group and have more energy and executive ability than the other tribes. Property formerly belonging to the Russian government has been declared the property of the republic, and the Georgian language, formerly in common use only among the peasants, has been declared the official language. Owing to years of disuse, it is somewhat undeveloped, but in recent months it has been introduced into the schools and adopted in governmental correspondence. At the beginning of 1919 the Caucasus was still occupied by British troops, with headquarters at Tiflis, a considerable force at Baku, and detachments at the larger points along the railway. The occupation lasted until Aug. 15, 1919. About 90 per cent of the population of Georgia is engaged in agricultural pursuits, but during the century of Russian occupation the superior productivity of the Russian steppes made itself so manifest that the raising of food grains in Georgia gradually declined until the Caucasus came to depend almost entirely on Russia for wheat, rye, and oats. The principal grain crop at present in Georgia is corn. Since the separation of Georgia from Russia the importation of grain from north of the Caucasus range has stopped, and renewed attempts have been made to grow food grains. In 1919 a larger area was sown to grains than ever before: the average increase in all districts over the 1917 area was approximately 20 per cent. The Georgian peasant population possesses all the characteristics of oriental peoples and opposes Western innovations. Agriculture is carried on to-day as it was 100 years ago. Plowing is performed by

means of steel points attached to a crooked bough or log and drawn by sometimes as many as 10 teams of oxen, and this primitive method persists in spite of the excellent modern examples furnished them by the various German and Swiss colonists scattered throughout the agricultural districts. Agricultural efficiency is further retarded by the post-revolution land distribution, which took place in practically all parts of the country. In many districts the peasants themselves took over the lands from the great landholders without supervision and divided them, in others government officials supervised the allotments. The maximum of land allowable for any one family is 7 dessiatines (about 17 acres). Some of the more highly cultivated estates have been kept intact; the government has confiscated them, and they are rented out, sometimes to their former owners. The year 1919 was very unfavorable to crops. The spring was late and the summer characterized by incessant rains, which changed toward autumn into devastating hailstorms, that destroyed the crops in several districts. The total crop of grains of all kinds, principally oats, barley, maize, and millet, in the Tiflis government for 1919 amounted to 7,154,863 poods (1 pood = approximately 36 pounds). The needs estimated by the statistics committee of the ministry of agriculture were as follows: For seed, 2,182,747 poods; for feeding the population, at the rate of 15 poods per head, 16,583,610 poods; for feeding live stock, at an average of 7 poods per head, 402,080 poods. For 1920 the estimates of the food supply of Georgia showed a deficit of 12,086,626 poods of grain foods in the Tiflis government alone. Figures for the government of Kutais, next in importance after the Tiflis government, showed a total production of 5,620,185 poods, with estimated needs of 15,252,046 poods, indicating a general deficit in this district of 9,632,715 poods.

COMMERCE. In the total trade of Georgia with Azerbaijan in 1919, imports were valued at 297,305,266 rubles, and exports at 180,770,530 rubles; with Armenia and the neutral zone, imports were 32,177,003, and exports 87,683,080 rubles; with Russia, imports were 137,889,223 rubles, and exports 29,394,361 rubles; with Batum and Western countries, imports were 395,665,364 rubles, and exports 96,129,265 rubles.

COMMUNICATIONS. The railway system in 1919 covered about 970 miles, of which 556 were on the main line from Batum via Tiflis to Baku. The Transcaucasian Railway before the Russian revolution was a single system comprising a direct line from Batum, on the Black Sea, to Baku, the port of the Caspian Sea, and a branch extending from Tiflis southward through Alexandropol to Kars and Erivan, but it was later split up among the three Caucasian states. At the time of the dissolution of the Transcaucasian cabinet each new government seized such rolling stock and railway materials as were within its borders and claimed them for its own. During 1919 the British controlled the short stretch of the railway from Batum to Notanebi, where the Georgian customs took over control. From this point to the little station of Poiili, where the main line crosses the Kura River, and on the southern branch from Tiflis to Sinaeen, Georgia operated the railway. Azerbaijan controlled the main line from Poiili to Baku, and Armenia the remainder of the southern branch. The larger part of the rolling stock happened to

be in Georgia, where the Russians had also built the main repair shop, in Tiflis. Azerbaijan owned all the crude petroleum used as fuel for the locomotives, but very few locomotives, and most of those were badly in need of repairs. Armenia, without either fuel or repair shops, fell into possession of but four locomotives and a small number of cars. Batum, at the end of the great pipe line from the oil fields of Baku, is of vital importance to international shipping. Several lines of steamers opened a regular service to Batum in 1919, the principal ones being the Paquet Line from Marseilles, the Cunard Line from British ports, the Italian Lloyd Trentino, and the Green Star Line from New York. The chief ports are Batum and Poti, the former being the terminus of the Transcaucasian Railway and of the oil pipe line from Baku.

GOVERNMENT AND HISTORY. The independent government of Georgia dates from the Bolshevik revolution. The Georgians formed along with the Armenians and the inhabitants of Azerbaijan the federal republic of Transcaucasia of which Tiflis in Georgia became the capital. The Diet of Transcaucasia declared this union an independent federal state, April 22, 1918. The constituent parts, however, soon split off (see ARMENIA and AZERBAIJAN), and Georgia declared its independence at Tiflis, May 26, 1918, which act was ratified by the constituent assembly, March 12, 1919. The new government was recognized by the Allied Powers, Jan. 16, 1920. The executive power was vested in a cabinet of ministers, chosen from the constituent assembly, under a president who acted provisionally as the supreme head of the state. The constituent assembly in 1920 was working out the organic law. In the provisional government, the ministers were responsible to the Assembly and the Senate was nominated by it. All the officers of the state were under the control of the Senate. The dominating political party in the constituent assembly was Social Democratic. The president of the cabinet at the end of 1920 was M. Jordania.

The note of the American Secretary of State addressed to the Italian ambassador in regard to the United States foreign policy gave offense to the authorities of Georgia by its reference to the republic as a "so-called state" and as the "illegitimate child" of Great Britain. The Georgian Minister of Foreign Affairs protested against these terms and emphasized the fight that his country had made against Bolshevism. He pointed also to the democratic principles on which the government rested. He declared that the independence of the country would be maintained and that it would remain neutral against the Soviet government, or any other aggression. At this time (September 10th) a British labor delegation was investigating conditions in Georgia.

GEORGIA, UNIVERSITY OF. A State institution of the higher education, at Athens, Ga., founded in 1801. There were 1031 students enrolled in the summer session of 1920 and in the regular fall session there were 1132. The members of the faculty numbered 70. The income for the year amounted to \$375,000. The library contained 42,500 volumes. President, David C. Barrow, LL.D.

GEORGIA SCHOOL OF TECHNOLOGY. A State institution of the higher education, at Atlanta, Ga., founded in 1888. There were 2224 students enrolled for the fall session of 1920, including 209 night school students, 240 in the

special courses for rehabilitation. The faculty numbered 100. The income for the year amounted to \$240,000. There were 15,000 volumes in the library. A new power station and engineering laboratory were added to the school plant, and an addition was made to the mechanical engineering building. President, K. G. Matheson, LL.D.

GERMAN COLONIES. The over-sea dominions of Germany were attacked by the Allies at the beginning of the war, and before the war was ended the conquest was complete. They consisted in Africa of the colonies of German East Africa (q.v.), Kamerun, Togo, and German Southwest Africa; in the Pacific of New Guinea with the Bismarck Archipelago, the German Solomon, Caroline, Marianne, Pelew, etc., islands (see GERMAN NEW GUINEA), and German Samoa (q.v.); and in the Far East, Kiaochow (q.v.). Total area, 1,140,117 square miles; total population, 13,258,000. Their destination was determined by the Treaty of Versailles. For the discussion of which the subject gave rise, see the article WAR OF THE NATIONS.

GERMAN COLONIES IN AFRICA. On October 1st, the German territories of Kamerun and Togo were officially turned over to France. The larger part of the territories had already been occupied by the French, but a small portion was still held by the English under the terms of the agreement between France and England of July 10, 1919. The present situation is based on articles 22 to 119 of the Treaty which obliged Germany to give up her colonies and at the same time formulated the rules for their government. According to the decision of the Supreme Council May 7, 1919, the mandates for the German colonies were distributed between the two Allies, and the Franco-British agreement of July 10, 1919, completed the details. It was not clear whether the French now held Kamerun and Togo by virtue of a mandate or as sovereign. From the moment that France had resolved to apply the principles of the League of Nations she appeared to be bound by the duty of the mandate provisions. A new administrative organization was at once begun in the two colonies. Kamerun was provided with a separate budget consisting of two parts: First, the general budget, and second, the railway budget. Courts of the first instance were created for the two colonies by decree and a council of administration framed on the model of those which functioned in French West Africa was established providing for representation of the natives. In both colonies postal systems were set up. The customs system established in French Equatorial Africa in 1912, was applied to the Kamerun. This was based on the principle of commercial equality. As to the payment for German property it was decided to sell it at open auction to foreigners as well as Frenchmen while reserving the rights of the state in matters pertaining to the public domain.

GERMAN EAST AFRICA. Before the war a German protectorate; now for the most part under British administration and known as the TANGANYIKA TERRITORY: lying to the south of British East Africa and extending from Lakes Victoria Nyanza, Tanganyika, and Nyasa to the Indian Ocean: with a coast line of about 620 miles. Area, estimated at 384,180 square miles; population estimated, Jan. 1, 1913, 7,659,898, of whom the whites were placed at 5366. In regard to education and production no later figures were

available than those given in preceding YEAR BOOK. Exports, 1918-19, £700,000, and imports, £1,008,000. The chief exports were cotton, sisal, hides, and copra, and the chief imports, cotton piece goods, etc., rice, food-stuffs, sugar, and tobacco. British troops completed the conquest in 1918 and the status of the colony was subject to the Treaty of Versailles. As the conquest proceeded a civil administration was established and it was completed at the beginning of 1919 when the invading troops were withdrawn. According to the decision of the Supreme Council made public in March, German East Africa was divided between Great Britain and Belgium; the former receiving 366,000 square miles out of the total area of 384,000 square miles; while Belgium received the two northwestern provinces of Ruanda and Urundi. Kamerun and Togoland were divided between Great Britain and France as mandatories. The British portion was termed officially the Tanganyika Territory with headquarters at Dar-es-Salaam. The Belgian portion administered under the Royal Commissary of the Belgian government with headquarters at Kigoma comprised the provinces bordering on Lake Tanganyika. The area of the Belgian portion is estimated at about 19,000 square miles. The British civil administrator at the beginning of 1920 was Sir H. A. Byatt.

GERMAN EVANGELICAL SYNOD OF NORTH AMERICA. See EVANGELICAL SYNOD OF NORTH AMERICA.

GERMAN LITERATURE. The precarious economic condition of Germany and Austria has so far not materially affected their literary production. Especially striking has been the activity of the German stage during the past year. With astonishing frequency premières have taken place in almost every large theatre. The output of fiction has been as large as ever; that of verse has apparently suffered no diminution, and even new editions of standard authors have been quite numerous. The only outward sign that the German book market has not regained its pre-war status is the poor quality of the paper on which the new books are printed.

The general attitude of the year's literature also barely differs from that of its predecessors. Echoes of the war linger in many publications of that "explanatory" nature to which the world has become accustomed since the fatal year 1914. Even some of the academic signers of the famous manifesto of 1914 have still something to say in defense of their country's ruthless aggressiveness. Others are inquiring into the possibilities of a socialistic organization of society. Again others in gloomy despondence see nothing but ruin and wreckage ahead and limn realistic pictures of a return to primitive barbarism. Only a few voices tentatively strike a note which suggests the timid dawn of a spiritual renaissance.

DRAMA. In spite of the great activity of the theatres and the surprising number of new plays that were staged during the past season, not one proved a success making it a landmark either in the author's development or in the evolution of the German drama. Yet the greatest names in the history of contemporary German drama were represented among the many premières. Gerhart Hauptmann, who has recently become deeply interested in Mexico old and new, has written a play, *Der weisse Heiland*, which he very properly calls a dramatic fantasy; for the welding of the Christ story with that of Montezuma can

hardly be considered anything but an interesting experiment. As such it was regarded by the audience which attended the first performance in Berlin, and which by this time is accustomed to see the poet grope for the realization of some dream, which defies being firmly molded in the solid form of the drama. His *Hirtensied* was also presented this season, preceding the performance of Hölderlin's *Empedokles*, which was given on the 150th anniversary of the poet. Another dramatic work by Gerhart Hauptmann, the title of which sounds exotic enough, *Indipohdi*, was published in the *Neue Rundschau*. His brother Carl, who is given to elusive fancies even more than Gerhart, and also deliberately ignores what is considered indispensable in dramatic construction, had two new works performed: *Gaukler, Tod und Juwelier*, a five act drama, and *Der abtrünnige Zar*, a "legend" in six parts. Neither of the works had a decided success. Georg Kaiser achieved the distinction of being the first German dramatist to have a play performed in England since the war; the London Stage Society gave *Von Morgen bis Mitternacht*. Heinrich Mann, the novelist who has won the esteem of all right-minded people by his open disapproval of his country's attitude in the war figures in the theatrical annals of the year as the author of a three-act drama *Der Weg zur Macht*. Heinrich Lilienfein, who some years ago made a very successful début as a dramatist, but has met with failures since, was unable to imbue his five-act play *Die Überlebenden* with real vitality. Wilhelm Schmidthonn's *Der Geschlagene*, Walter Hasenclever's *Die Entscheidung*, Karl Riebesoll's *Leidenschaft*, Oscar Bendiner's *Der Renegat*, Karl Sloboda's *Die Pharisäer*, Paul Wertheimer's *Die Frau Rat*, in which Goethe's mother figures, Robert Precht's *Alkestis* which presents the classical problem in modern garb, Reinh. Zenz's *Lob der Nartheit*, a marionette play, Kurt Eisner's *Die Gottesprüfung*, a political farce, Alfred Brust's *Der ewige Mensch*, which strikes the Christ-motive, and Karl Neurath's *Der Bundschuh*, a five-act tragedy which derives its title from a German peasant uprising, had each little more than a *succès d'estime*. Two successful comedies were Heinrich Lautensack's *Die Pfarrhausköchin*, and Hermann Barsdorf's *Kramer Kray*, and *Am Glockenturm* by the Alsatian René Schickelé was credited with being written around an original idea. The purely historical drama was represented by Hermann von Bötticher's *Friedrich der Grosse*, the fairy drama by K. von Felner's *Roland's Knappen*. Hans J. Rehfish created some discussion with his three act tragedy *Das Paradies*, in which he has five survivors of the general débâcle of civilization following upon the war take up their abode in some mountain solitude and attempt to realize an Utopia, the experiment being financed by one of the members, an American, whose optimism nothing can shake. Another play that caused some talk was Fritz von Unruh's *Platz*, the second of his trilogy of the times begun in *Das Geschlecht*, and to be finished in *Der Taumel*. Of poetical dramas *Godiva* by Hans Franck was most highly spoken of by the critics, among them Stefan Zweig.

FICTION. The productivity of some German writers in spite of the distressing conditions that are said to prevail in the country is amazing. Carl Hauptmann has published two books of fiction within the year: *Der Mörder* and *Die Unwissende Stute*, the latter called a "legend";

his name figures also upon the title-page of a cleverly illustrated short story with American background: *Das Kostümgenie*. Heinrich Mann, too, has a novel to his credit, besides the play mentioned above; it is entitled *Die Ehrgeizige*. Hermann Hesse, who has for some years been living in Switzerland, has sent out two volumes: short stories under the title *Klein Garten* and *Demian*, *Geschichte von Emil Sinclairs Jugend*, a novel. Felix Philipp seems to have abandoned drama, his latest work being another story: *Monica Vogelsang*. The Swiss novelist Ernst Zahn has published a volume of short stories called *Helden des Alltags*. Carl Sternheim's new novel bears the suggestive title *Europa I/II*. In his book of short stories, *Der Wendepunkt*, Jacob Wassermann announces that a new form of narrative is about to evolve, more in harmony with the change in the spirit of the time. Clara Viebig, whose popularity makes her alarmingly prolific, figures in the year's fiction with the short stories entitled *West und Ost* and the novel *Das rote Meer*. Alfons Petzold, the Viennese poet, has sent out the novel *Das rauhe Leben*, the title of which suggests that he is still concerned with the grim tragedies of poverty. The poet-philosopher Bruno Wille has once more made an excursion into fiction in the volume entitled *Der Glasberg, Roman einer Jugend*. Johannes Schlaf, once the fellow-founder with Arno Holz of "naturalism" in German drama and fiction, but long since working along individual lines, has after some years of silence published a story called *Miele*. Ludwig Thoma's Bavarian story *Der Jägerloisl*, August Sperl's *Der Archivar*, Rudolf Hans Bartsch's *Ewiges Arkadien*, Rudolf Stratz's glacier story *Der weisse Tod*, Fedor von Zobeltitz's story of aristocracy during the revolutionary year, *Die von Scheibitz*, Alice Berend's book of middle-class Berlin, *Spreeman & Co.*, Karl Hans Strohl's *Attentäter*, Wilhelm Scharrelmann's *Selige Armut*, Rudolf Greinz's volume of legends *Die Pforten der Ewigkeit*, Raoul Auernheimer's short stories *Das ältere Wien*, Carl Busse's new book, *Fläumchen*, and Woldemar Bonsels's *Indienfahrt*, called a German *Junglebook*, have elements of popularity, though not of long lasting vitality. Johann Gilhoff's novel *Jörnjakob Suehn, der Amerikafahrer* is the typical story of a German-American immigrant, who on having acquired money and a home of his own, still does not feel an American, but considers himself bound to the fatherland. Armistice Day gives the title to Bernhard Kellermann's story *Der 9te November*, and *Ararat* by Arnold Ullitz is a weird story of the lapse into barbarism, which the war and Bolshevism have brought to his German hero and Russian heroine.

POETRY. While there are many volumes of verse by hitherto unknown authors on record, few of the older poets have produced new works. After many years of silence, Hugo Salus, practising physician in Prague, has given us the little volume entitled *Das neue Buch*. Hans Heinrich Ehrler's *Gedichte* is in the vein of his earlier work. Will Vesper's *Mutter und Kind* is a book full of tender feeling. Franz Werfel, who made his début shortly before the war as one of the strongest individualities among the younger poets, has attempted an ambitious task in the volume entitled *Der Gerichtshof*. Marie Madeleine, whose sensational success as a writer of erotic verse is still remembered, has after some years of silence sent out a new volume, *Taumel*,

which is slightly more moderate in tone and tempo. Julius Bab figures on the title page of two anthologies: *Die deutsche Revolutionslyrik* and *1914—der deutsche Krieg im deutschen Gedicht*.

LITERATURE, CRITICISM, ETC. No very important work has been added to literature and criticism. But there have been numerous monographs on individual writers, which form interesting reading, though they may not throw much new light on their subjects. Goethe-literature has been enriched by Emil Ludwig's *Goethe*, which purports to be the story not of the great German poet, but of the man Goethe, and might therefore be as properly classed with biography. The same is true of Etta Federn's *Hebbel*, which is a specimen of biographical fiction and which has caused no little discussion among the Hebbel authorities. Heinrich Maync is the author of a volume on *Theo. Fontane 1819-1919*, which ends in an inquiry into the rank accorded to the poet-novelist a hundred years after his birth. F. F. Baumgarten has written a critical study entitled *Das Werk Conrad Ferdinand Meyers*. Paul Heukamer is the author of a book on that eccentric member of the romantic School of Germany, Zacharias Werner. Nietzsche comes in for a share of serious attention in several books, among them Ernst Howald's *Friedrich Nietzsche und die klassische Philologie*. There have been books on Heine, Jeremias Gotthelf, Hölderlin, and others.

BIOGRAPHIES, LETTERS, MEMOIRS. The serious interest in socialism and the personages identified with its history manifests itself not only in several books on the Marxian system, but also in biographical studies, foremost among them Hermann Oncken's *Ferdinand Lassalle*, which he calls a social-political biography. Psycho-analysts are prying into the lives of the great writers, a striking example of their methods being Eduard Hirschmann's *Gottfried Keller*, frankly called a "psycho-analytic study." Hermann Esswein has given us a new book on Strindberg. Karl Quenzel's work, *Der Maler Feuerbach*, is a biography of the artist based on letters and memoirs. Moritz Stühl has added to Chodowiecki literature the diary recording the artist's journey to Dresden and Leipzig. Ernst Anemüller is the author of a Schiller book: *Schiller und die Schwestern Lengefeld*, and Albert Janssen has written on *Die Frauen rings um Hebbel*. Eduard Brandes is the editor of the letters of Jens Peter Jacobsen, which has been promptly translated. Richard Dehmel's *Zwischen Volk und Menschheit* is a new war diary. Gustav Frenssen's *Grübelzeiten—1890-95* is a book of leaves from diaries, notes on current events, aphorisms, etc. The *Lebenserinnerungen* by von Eckartstein of which the first volume is dated 1895 gives interesting glimpses of German public life.

HISTORY, WAR BOOKS, ETC. Hans von Helmolt presents *Ein Vierteljahrhundert Weltgeschichte 1894-1919*. He has also made an attempt to discredit the authenticity of Karl Kautsky, the socialist writer, who on getting hold of the documents in the archives of the government has done so much towards enlightening the Germans about the causes of the war. Helmolt's book bears the title *Kautsky, der Historiker*. A book called *Die neueste Geschichte des jüdischen Volkes* is said to be translated, but the original language is not mentioned; the author's name on the title-page is S. M. Dubnow. Of the numer-

ous war books Otto von Stölpnagel's *Die Wahrheit über die deutschen Kriegsverbrechen* is only one of many attempts to deny the evidence of Allied and neutral witnesses. In *Kriegsfahrten deutscher Maler* are collected notes taken by German painters in 1914-15 in France, Belgium, the Dardanelles, etc. Count Luckner, the commander of the cruiser *Seeadler*, dedicates the story of his adventures, *Seeteufel*, to "his boys."

FOLKLORE, TRAVEL, ETC. Wilhelm Hausenstein is the editor of a selection from the world's fairy-tales, which is illustrated by reproductions of carvings, sculpture, pottery, textiles, etc., and is entitled *Faoten*. Theodor Koch-Grünberg has edited a collection of *Indianermärchen aus Südamerika*. A. Diss is responsible for a book on *Kaukasische Märchen*. Otto von Taube for a volume of *Russische Märchen*. *The Siyavashi*, the old Persian tale from Firdusi, has been brought out in a new edition. Victor Ottman has written a book called *Mexikaner*, Heinrich Schiller is the author of *Brasilien, ein Land der Zukunft*, and Leo Mirau of *Argentinien*. A warning to Germans not to emigrate to the United States is contained in H. Zetzsch's *An der Indianergrenze*, which is announced as a truthful picture of America for the instruction of young and old. Bernhard Kellermann's *Ein Spaziergang in Japan* is a book of some charm, and Stefan Zweig's *Fahrten, Landschaften und Städte* is delightful reading.

PHILOSOPHY, ETHICS, ART, MUSIC. Emil Barthel is the author of a work called *Polargeometrie*. Karl Vorländer attempts to deduce the philosopher's reading of life from his writing in *Kants Weltanschauung aus seinen Werken*. Hermann Heise is responsible for *Zarathustra's Wiederkehr ein Wort an die deutsche Jugend*. Martin Havenstein strikes also a serious note in addressing his people: *Vornehmheit und Tüchtigkeit dem deutschen Volke zur Einkehr*. Under the collective title *Die Freude* and the sub-title *Blätter einer neuen Gesinnung*, Wilhelm Uhde edits an attractive work, containing selections from the world's literature from Schiller to Paul Claudel and reproductions of art from Beltraccio to Picasso. Konstantin Umansky is the author of *Neue Kunst in Russland—1914-19*. Paul Wertheimer has written the preface to the book *Indische Baukunst* contained in the *Orbis Pictus*. Hans Joachim Moser has written a new history of music; Hans Volkmann a biography of *Emanuel d'Astorga*, Eugen Segnitz a book on *Arthur Nikisch*. C. J. Glasenapp on *Siegfried Wagner und seine Kunst*, and Sebastian Röckl adds another book to the voluminous literature on the subject suggested by the title: *Ludwig II und Richard Wagner*.

MISCELLANEOUS. Carry Brachvogel reviews the political possibilities opening before woman in *Eva in der Politik*. Jacob Schaffner seems to have been converted to socialism: his new book is entitled *Die Erlösung vom Klassenkampf*. *Der Atheismus und seine Geschichte im Abendlande* by Fritz Mauthner directs attention to a subject almost forgotten in the present preponderance of social problems. Christian Morgenstern has published a book of *Epigramme und Sprüche*. It is reported that Gerhart Hauptmann, who in his youth studied sculpture in Rome, has once more installed himself in a studio. Hermann Hesse, too, has given proof of versatility by exhibiting his water-colors in Basle. On receiving the Grillparzer Prize for

his latest drama Karl Schönherr turned over the amount to the suffering children of Vienna's poor. Helen Keller has turned over the proceeds of the German editions of her works to the Germans blinded in the war. Considerable sensation has been caused by the appearance of a book under the title *Rudolf der Letzte-Tagebuch eines deutschen Fürsten*, a fictitious diary drawing upon the war books of Bethmann-Hollweg, Czernin, and others. Stefan Zweig has published a protest against an unauthorized translation of his story *Brennendes Geheimnis*, which was published in America under the title *The Burning Secret* and credited to one "Stephen Branch." There have been numerous new editions of E. T. A. Hofmann, Theodor Storm, Friedrich Theodor Vischer, Anzangruber, Chamisso, Glasbrenner, and a new volume in the Weimar Goethe Edition. The writings of Alfred Kerr, the critic, of Gustav Meyrink, the inimitable satirist, of Wedekind, and others have been collected. Among the many translations are Romain Rolland's *Colin Breugnot*, the popular tales of Tolstoy, works by Anatole France, Louis Couperus, Remy de Gourmont, Karl Gjellerup, Selma Lagerloef, and French, Italian, and Spanish classics.

NECROLOGY. Franz Hirsch, the venerable editor of magazines which he outlived by many years, died, July 18. Another representative of the old generation, Bernardine Schulze-Smidt, whose stories revolved mainly about life in Bremen, passed away, February 17, at the age of 74, after having finished a new story since published. The death of Richard Dehmel, February 8, removes from the ranks of what in the nineties was called "Young Germany" one of its most interesting figures. Swiss literature has suffered the loss of Adolf Frey, poet and literary historian, who died, February 12, in Zurich. Leopold von Schröder, philologist and literary critic, died in Vienna on February 9th. Franz Koppel-Elfeld, dramatist and collaborator with the popular von Schönthan, passed away January 16th. In Ludwig Ganghofer, who died, on July 24th, Munich lost one of her most popular literary celebrities. Jeannot Emil Freiherr von Grothuss, a writer who founded one of the best monthly magazines, *Der Türmer*, and Karl Storck, the editor of that magazine, died during the summer. August Spanuth, pianist and music critic, died January 11th. Wilhelm Wundt, the famous physiologist, passed away, August 31.

GERMAN NEW GUINEA. The territories now known as NEW GUINEA, formerly held by Germany in the West Pacific including Kaiser Wilhelm's land; Bismarck Archipelago; the German Solomon Islands; Nauru, the Caroline Islands, the Marshall Islands, and the Marianne or Ladrone Islands, with the exception of the island of Guam. These colonies were occupied by the Australians, Sept. 12, 1914. Under the Treaty the islands north of the equator namely, the Marshall Islands, the Carolines, the Pelew, and Ladrone islands were turned over to Japan under a mandate, and those south of the equator including the Bismarck Archipelago, the German portion of the Solomon Islands, and Kaiser Wilhelm's land were assigned to Australia. German Samoa was assigned to New Zealand, and Nauru was assigned to Great Britain under a mandate. At the beginning of 1920 the British administrator of the New Guinea possessions of

Germany south of the equator was Brig.-Gen. G. J. Johnston.

GERMAN PROTECTORATES. See GERMAN COLONIES.

GERMAN SAMOA. A former German protectorate comprising that portion of the Samoan group which lies to the west of longitude 171° east; now known as the territory of Western Samoa, including Savaii and Upolu, the largest of the Samoan islands. Area, about 994 square miles; population, about 40,000. They were occupied by the New Zealand forces Aug. 29, 1914, and their status was subject to the Peace Conference, at which it was proposed that they should be governed by New Zealand as a mandatory under the League of Nations. The plan of government proposed by New Zealand included a legislative council to which native chiefs would be eligible.

GERMAN SOUTHWEST AFRICA. A former protectorate of Germany lying between Angola and the Cape Province of the Union of South Africa; captured by South African forces from the Germans in July, 1915; and administered after the war by the Union of South Africa under a mandate. Area, 322,200 square miles; European population in 1913, 14,830, of whom 12,292 were Germans. For statistical details pertaining to education, production, etc., see preceding YEAR BOOKS. In 1918 the imports were £1,031,534. In 1917-18 the revenue was £306,045 and the expenditure £650,052. For military purposes a number of railway lines were built during the war and they have since been extended. The total mileage in the protectorate was placed at the beginning of 1920 at 1417.

GERMANICS. See GERMAN LITERATURE; PHILOLOGY; AUSTRIA; SWITZERLAND; HOLLAND; ETC.

GERMANY. See IRON AND STEEL; NAVAL PROGRESS.

GERMANY. A republic set up after the war in place of the imperial monarchy overthrown in the revolution of the closing months of 1918; organized under the constitution adopted July 31, 1919, and promulgated Aug. 13, 1919; formerly the German empire, a constitutional monarchy consisting of 25 federated states and an imperial territory or Reichsland; situated in central Europe.

AREA AND POPULATION. The 25 states of the former empire had an area of about 208,825 square kilometers, exclusive of the German part of Lake Constance and the North Sea lagoons, with a population estimated before the war, June 30, 1914, at 67,812,000. The latest official figures before the war were those of the census of 1910 which are given in detail along with final statistics in preceding YEAR BOOKS. In 1920 the area of the German republic was given at 203,176 square miles and the population at 63,051,979, the latter figures being based on the census of 1910, and giving a density of 310.3 per square mile. As the arrangements under the Treaty of Versailles were still incomplete, the existing limits of the republic in 1920 were not known, but the above figures were probably excessive, and a closer estimate for area was about 171,910 square miles and the population about 55,086,000. These estimates are based on the losses occasioned by the following changes prescribed by the Treaty: 1st, Alsace-Lorraine returned to France; 2nd, the larger part of West Prussia ceded to Poland; 3rd, a portion of Eastern Gali-

cia ceded to Poland; 4th, part of Upper Silesia to Czecho-Slovakia; 5th, Eupen and Malmely to Belgium; 6th, Memel to the Allies; 7th, Danzig to the Allies. Of these Alsace-Lorraine was estimated at 5604 square miles, with a population of 1,874,014; the Polish cession at 17,756 square miles, with a population of 3,500,000; the part ceded to Belgium, 386 square miles, with a population of 65,000; Memel, 965 square miles, with a population of 650,000; Danzig, 579 square miles, with a population of 250,000. The regions to be determined by plebiscite were estimated at an area of 11,580 square miles with a population of 3,500,000. There was finally the Saar Basin which was placed for a term of years under the League of Nations and was at the expiration of that term to decide by popular vote upon its destination; area, estimated at 220 square miles, with a population of 640,733. The area under temporary occupation by the Allied military forces was placed at about 9650 square miles with about 7,000,000 inhabitants. The cities over 500,000 at the census of 1910 were as follows: Berlin, 2,071,257; Hamburg, 931,035; Munich, 596,467; Leipzig, 589,950; Dresden, 548,308; Cologne, 516,527; Breslau, 512,105. Berlin at the census of Oct. 20, 1919, was given at 1,897,864. No later figures for education were available than those given in preceding YEAR BOOKS.

EMIGRATION. No complete figures of emigration for the year 1920 were available, but during the first nine months the emigrants to Brazil, Argentina, Mexico, and the United States numbered 6010 of whom a very small number went to the United States. While this was twice as many as had emigrated during the same period in the preceding year, it was but a small fraction of what had been expected. It was estimated at the close of the year that nearly 5,000,000 Germans were ready to emigrate if they could procure the money for their passage, the greater part of them wishing to go to Brazil on account of the good opportunities for colonization there offered. At the close of the year the government was undertaking by means of a series of lectures to supply intending emigrants with information in respect to the South American countries. Some alarm was expressed by officials over the class of German emigrants who were said to come from the most desirable elements.

PRODUCTION. Over 90 per cent of the soil had been estimated as productive before the war and the arable land was placed in 1913 at 65,148,000 acres; the woods and forests at 35,558,000; meadows, pasture, and grass at 21,760,500. The chief crops in 1919 with their acreage and total yield in metric tons were as follows: Wheat, 2,828,150 acres and 2,169,169 metric tons; rye, 10,789,235 acres and 6,100,444 metric tons; barley, 2,815,127 acres and 1,910,363 metric tons; oats, 7,482,197 acres and 4,453,688 metric tons; potatoes, 5,451,982 acres and 21,449,186 metric tons. The yield of beets in 1916 was 16,877,520 metric tons. (See AGRICULTURE.) The International Bureau of Agriculture published in November the following figures for live stock in Germany, showing the movement since 1912: Horned cattle, March 1, 1912, 16,444,723; July 2, 1919, 16,381,605; June 1, 1920, 16,981,522; sheep, on these respective dates, 6,241,726; 6,162,794; 7,021,342; hogs, 8,610,796; 9,430,268; 11,656,813; goats, 5,781,750; 4,679,419; 4,967,537.

Prussia is the main source of mineral produc-

tion and the principal mining regions are in Rhenish Prussia, Westphalia, and Silesia, for iron and coal; in the Harz Mountains for copper and silver; and in Silesia for zinc. The source of a considerable part of Germany's mineral wealth was in the regions lost in the war. Complete figures for recent mineral publication were not available but the following information was issued in respect to potash and lignite in 1920. The potash deposits of Germany, which were discovered by the Prussian government in 1843 at Stassfurt while boring for rock salt and which occur in upper layers of rock salt in the plains of Northern Germany, have been estimated to occupy a volume of 10,790,000,000 cubic meters and to contain 20,000,000,000 metric tons of potash salts, corresponding to about 2,000,000,000 metric tons of potash (K_2O), a quantity sufficient to supply the world for 2000 years at the present rate of consumption. These beds were first exploited about 1860, and have furnished practically the entire world's supply of potash for many years. The results of the lignite mining in the Niederlausitz district, in spite of many interruptions, were more favorable in 1920 than in 1919. The output increased from 20.4 to 24 million tons, and the production of briquettes from 5.5 to 6.5 million tons. In comparison with 1919 the output of the individual miner showed a slight improvement, although still only half that of 1913.

COMMERCE. Before the war the foreign trade of Germany was according to the *Statesman's Year Book* for 1920 as follows in 1913: Imports, £560,335,800; exports, £509,965,000. During the 10½ months following the signing of the armistice, the exports of the United Kingdom to Germany were valued at £16,207,748 and the imports to the United Kingdom from Germany at £217,435. During the year ending June 30, 1919, the United States exported to Germany goods to the value of \$8,818,882 and imported \$944,981. In 1920 the government had not resumed its publication of the statistics of foreign trade, but the following information was supplied by the Berlin press: Prior to the war Germany's foreign trade always showed an adverse balance, but this was more than compensated by shipping activities, foreign holdings, and interest on capital invested abroad. The mercantile fleet alone brought in 1,000,000,000 to 1,500,000,000 gold marks gross profits during 1913, equal to 60 to 65 billion paper marks under present conditions. The following figures show the foreign trade of Germany with several countries during 1919:

Country	Exports to Germany	Imports from Germany
France	francs 1,283,968,000	590,696,000
England	pounds sterling 23,180,000	993,415
United States	dollars 92,761,314	10,608,141
Switzerland	francs 698,000,000	482,000,000
Czechoslovakia	crowns 843,838,000	789,130,000

FINANCE, JAN. 1, 1920. At the beginning of the year, the budget estimates for 1920-21 as given by the *Statesman's Year Book* were as follows:

	Revenue	1,000 marks
Customs (calculated on a peace basis)		1,800,000
Tax on consumption		5,900,000
Tax on financial operations		1,000,000
Tax on business		3,000,000
Tax on property		3,000,000
Tax on capital		3,000,000
Various		7,600,000
Total		25,300,000

Expenditure	1,000 marks
Debt	10,000,000
Pensions and indemnities	4,300,000
Administration	1,700,000
Army	1,500,000
Pensions for officers	200,000
Various	6,500,000
Total	24,200,000

The total gold, silver, and other metal coin in circulation March 31, 1918, was 7,428,077,200 marks; the total paper money in circulation Jan. 31, 1918, was 17,731,000,000 marks. The total funded debt Oct. 1, 1918, bearing interest was 93,719,974,200 marks; treasury bills bearing no interest, 23,017,629,500 marks; total loan credits on Oct. 1, 1919, 90,400,000,000 marks; total public debt estimated at the beginning of 1920, 204,000,000,000 marks of which the war debt was officially estimated at 157,700,000,000 marks; calling for interest to the amount of 7,900,000,000 marks.

FINANCIAL SITUATION, APRIL 1. The above figures show the financial situation as reported at the beginning of the year. The following information in regard to conditions at the end of March was supplied by the United States Bureau of Foreign and Domestic Commerce on the basis of reports in the Berlin press:

On March 31, 1920, Germany's national debt amounted to 197,000,000,000 marks (New York mark exchange then about \$0.025), of which sum only 92,000,000,000 marks, i.e. not quite half, was consolidated by means of long-term loans. The debts of the federal states amounted on Aug. 1, 1917, to 17,500,000,000 marks in firm loans and 12,500,000,000 marks in short-term liabilities, while the debts of the Communes amounted to 12,500,000,000 marks consolidated and 10,000,000,000 marks unconsolidated. The entire national debt of Germany would, therefore, amount to about 250,000,000,000 marks, or about 4500 marks per capita of the population of the country since the peace treaty, as against one-tenth of that amount in 1914. At that time Germany's liabilities, which were almost exclusively incurred for productive investments, were counterbalanced by actual values of at least the same amount. The 250,000,000,000 marks above mentioned were entirely uncovered. The expenditure of the commonwealth for the year 1920 was estimated at 27,900,000,000 marks for the ordinary budget as laid before the National Assembly by the Finance Minister early in May. To this sum must be added extraordinary expenditures, estimates at 11,600,000,000 marks, and the deficit of the post office and railways, which formerly showed a profit amounting to the enormous sum of 15,000,000,000 marks. This made a total debit for the year, and that, too, for commonwealth requirements only, of 54,500,000,000 marks. Amendments introduced into the estimates by the National Assembly with regard to the salaries of civil servants involved an additional expenditure of 2,000,000,000 marks in the ordinary budget. Moreover, since the general increase of prices induced by the depreciation of money had by no means reached its highest point, there was every probability that the administrative expenses as regards personnel would increase still further. And in the same way the expenditure in the extraordinary budget—in which, to take only a few items, the damages caused by the riots are put down at 1,000,000,000 marks, demobilization of the old army at 2,100,000,000

marks, and the liabilities incurred under the peace treaty at 5,000,000,000 marks—was likely to exceed the estimate. The fiscal requirements of the federal states and Communes could not be ascertained with accuracy, since only a few budgets had been published. But in 1919 the Finance Ministry had estimated the future financial needs of the commonwealth at 17,500,000,000 marks and those of the individual states and Communes at 6,000,000,000 marks. Owing to the great increase of expenditures the requirements of the states and communes probably amounted to between 18,000,000,000 and 20,000,000,000 marks. It was therefore probable, then, that the total sum which the German nation would have to expend in 1920 would amount to between 75,000,000,000 and 80,000,000,000 marks.

The estimated revenue of the commonwealth for 1920 was as follows:

	Billion marks
Share in direct taxation	4.4
Saving in interest effected by the Commonwealth emergency levy	2.25
Tax on sales (Umsatzsteuer)	3.1
Coal tax	4.5
Tobacco tax	1.0
Customs export dues	3.5
Stamp tax and dues from banks and railway traffic	2.0
Direct and indirect dues	1.0

This gave a total of 22,000,000,000 marks. From the nonrecurrent revenue from the war taxes, viz. the tax on increased fortunes and the super-income tax, 3,000,000,000 marks were still available for 1920, so that the total revenue for the year might be increased to 25,000,000,000 marks. That was not even enough to meet the ordinary expenditure, which exceeded that sum by 2,900,000,000 marks. According to the plans of the Finance Ministry, this deficit was to be covered by various new taxes. On the other hand, there were no credit items at present to counterbalance the extraordinary expenditure and the deficits of the postal and railway services. Matters stood somewhat better with the federal states and communes, whose total revenue, in the absence of reliable data might be estimated at about 15,000,000,000 marks. The financial position of the commonwealth, states, and Communes might therefore be shown as follows:

Debit:	Billion marks
Commonwealth—	
Ordinary expenditure	27.9
Extraordinary expenditure	11.6
Deficit of posts and railways	15.0
States and communes, about	20.0
Probable excess of the budget estimates (10 per cent)	8.0
Total	82.5
Credit:	
Current commonwealth taxes	25.0
New taxes to be imposed	2.9
Revenue of states and communes	15.0
Uncovered deficit	89.6
Total	82.5

Provided, therefore, that the expected increased expenditure was kept within modest limits and that the revenue from taxes and dues did not fall far behind the estimates there would remain an uncovered deficit of approximately 40,000,000,000 marks. To obtain this sum by means of a loan would increase the amount of Germany's national liabilities to 300,000,000,000 marks. The payments already made and to be made on

the Entente's indemnification account were confined to the sums demanded for the deliveries, required under the peace treaty, of coal, machinery, chemicals, cattle, etc. Further sums must be forthcoming for the indemnification of the owners of vessels and dock material to be surrendered, for the payment of pre-war debts, for which the commonwealth had to assume the difference in the rate of exchange, and for other payments still in arrears.

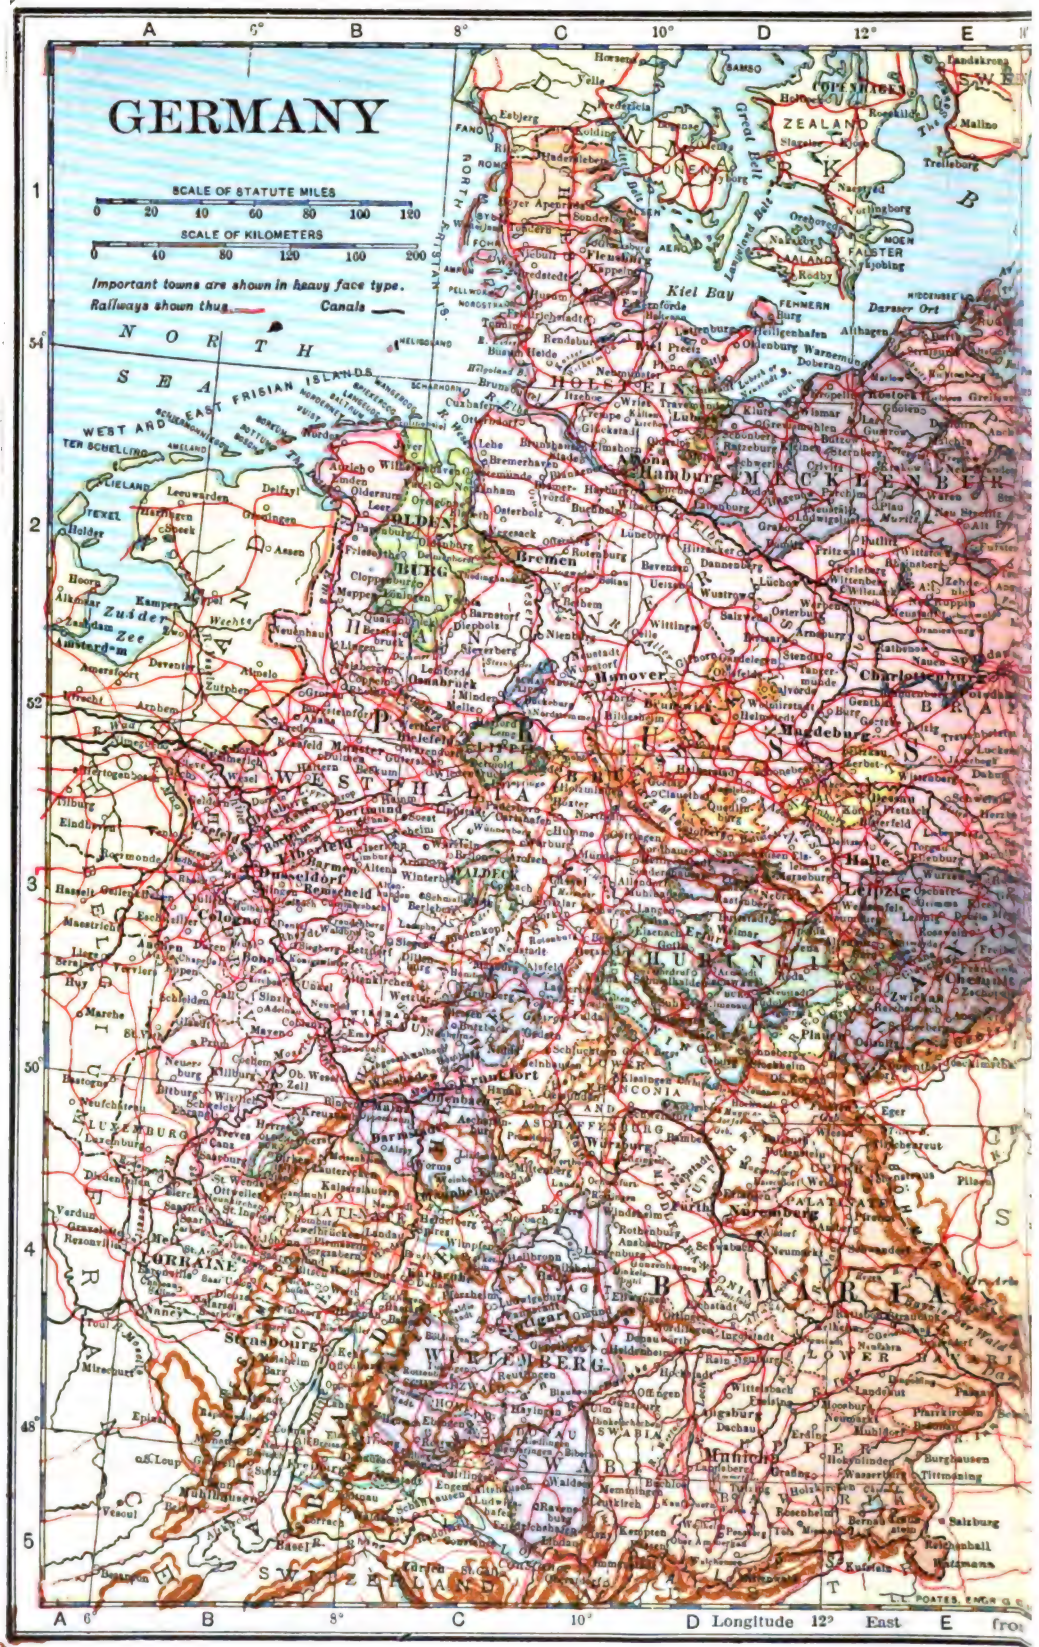

TAXATION. With an annual revenue of over 40,000,000,000 marks, Germany, as regards the yield of taxation, headed all other nations according to German writers. They cited an estimate prepared by M. Dumont, chairman of the French budget committee, which figured the contributions per capita of the population in various countries as follows: England, 526 francs; France, 453 francs; America, 272 francs; Italy, 228 francs; and Germany, 700 marks. They said, the objection that these figures only represent paper marks would not hold water. For while in January the prices for many articles for which Germany must rely wholly or in part upon import from abroad had accommodated themselves to the depreciation of the mark in foreign countries, incomes of all kinds, including manufacturers' profits, wages, and salaries, had not increased in anything like the same proportion as the mark had fallen. To what an extraordinary extent German incomes and fortunes were being drawn upon for the public requirements might be judged from the following examples: A taxpayer who hitherto had lived on the interest derived from a capital of 1,000,000,000 marks, had drawn 50,000 marks annually in interest, had to contribute 244,250 marks of this capital to the commonwealth emergency levy. Of this reduced income of 37,787 marks he had to pay 8931 marks income tax and 3778 marks tax on the yield of capital, so that only 25,078 marks remained of his original income of 50,000 marks. And this income, reduced by exactly one-half, was further burdened with indirect taxes of all kinds. A taxpayer who before the war had a capital of 2,000,000,000 marks, and had doubled it during the war, was in the spring of 1920 taxed as follows: 2,328,030 marks war tax and 1,004,500 marks on the emergency levy. Of the income remaining to him he had to pay 26,439 marks income tax and 8337 marks tax on the yield of capital, so that, after paying direct taxes, only 48,599 marks—that is, less than one-fifth of his original income of 250,000 marks—remained, and this was still further reduced by the other taxes on consumption, transport, etc. In spite of these enormous rates of taxation, these four direct taxes did not bring in even one-half of the annual burden of the above-mentioned 40,000,000,000 marks imposed upon the German nation.

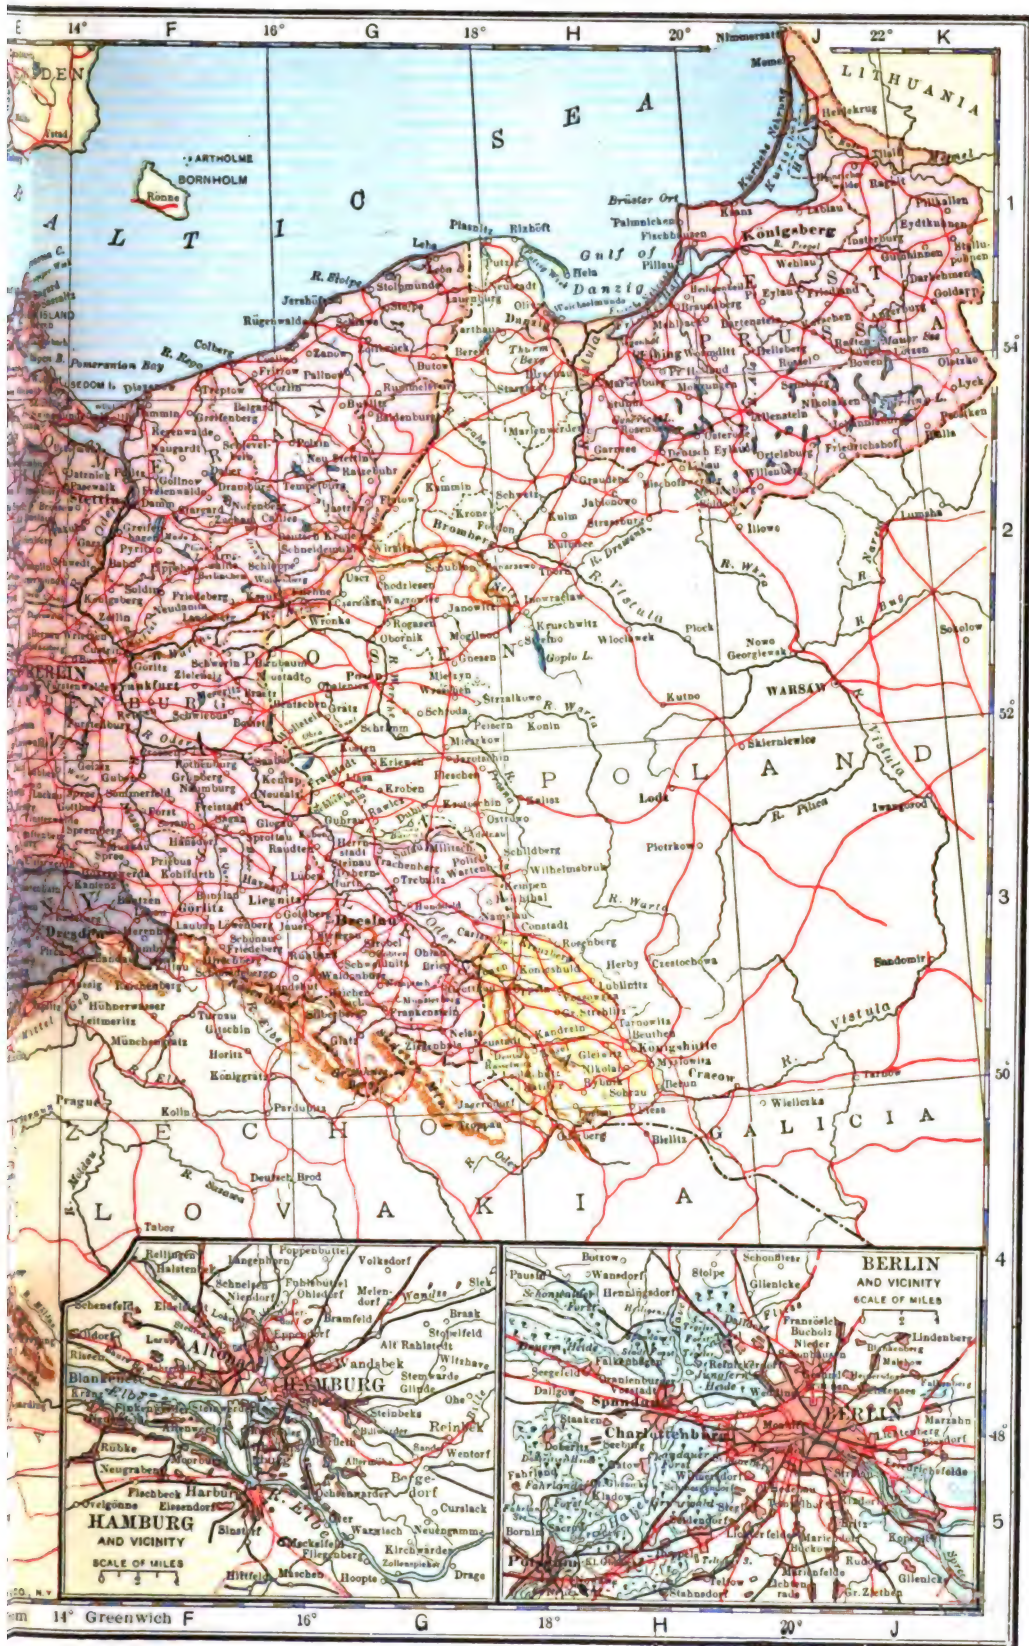

FINANCIAL SITUATION IN THE SUMMER. In the Reichstag session of July 1, 1920, the condition of German finances was discussed by the Minister of Economics. After having pointed out that the expenditure of the commonwealth during 1919 had amounted to not less than 74,500,000,000 marks (14,400,000,000 marks were needed for covering regular expenses and 57,750,000,000 for meeting irregular expenses; 1,800,000,000 billion were consumed by the amortization of debts), he analyzed the budget for 1920, which was still awaiting its final settlement. The main items of the budget were set down as follows:

Expenses:	Marks
Commonwealth debts	12,400,000,000
Pensions, military pensions paid to disabled men, pensions paid to the widows of fallen men	3,900,000,000
Expenditure incurred by the new decree concerning the pay of soldiers, etc.	3,000,000,000
Expenditure on the food supply of the population	3,000,000,000
Military and navy budget	1,900,000,000
Budget of the Commonwealth Work Ministry (paying for the medical treatment of wounded soldiers) ..	1,100,000,000
For miscellaneous purposes	2,700,000,000
Revenues of the regular budget are thus estimated:	
Revenues coming from administration ..	200,000,000
Direct taxation and taxes on traffic ..	10,800,000,000
Duties and consumption tax	9,100,000,000
Some other direct taxes	3,000,000,000
Revenues flowing from banks and from export duties	2,000,000,000
Revenues expected from new taxes not yet granted	2,900,000,000

Should the new taxes, mentioned as the last item, be granted, the revenues of the regular budget would cover the expenditure for the first time since the outbreak of the war; but there was little hope of accomplishing this, as it was yet very doubtful whether the entire sum set down on paper would be reached. The increase in the deficits of the postal and railway administration was reaching large figures. The postal administration had recently estimated its deficit at 870,000,000 marks and the railway administration its deficit at from 12,000,000,000 marks to 15,000,000,000 marks.

The financial situation of Berlin was set forth by the German delegates to the Brussels Conference and the main points were as follows: On August 31st according to them the debts of the empire amounted to 240,000,000,000 marks an increase of 40,000,000,000 marks since May 31st. The cause of this increase was the falling off in the state-controlled industries. The debts of the separate states amounted to 24,700,000,000 marks. The budget for 1919 could not be determined exactly on account of the lack of precise figures for the receipts but the receipts were placed at only 7,617,000,000 marks while the expenses amounted to 75,324,000,000 marks. The budget estimates for 1920 made ordinary receipts and expenditures balance at 39,800,000,000 marks, while the extraordinary budget was 37,666,000,000 marks. The Germans defended their war and navy budget which amounted to 5,089,000,000 on the ground that it was the fault of the Treaty which obliged Germany to abolish obligatory military service and employ a mercenary force which required a high rate of pay. The increase of the extraordinary expenses was explained by the war burdens which increased to the extent of 47,000,000,000 marks for 1919-20 of which 4,769,000,000 fell within the first quarter of 1920. The chief financial measures taken were a general income tax and a tax on business. The framers of the report pointed out the difficulty of determining the receipts and the seriousness of the situation in view of the fact that after the plebiscite a tenth of Germany's territory might be taken away. As to credit circulation it continually increased because the receipts did not cover the expenditures. It had mounted from 5,528,000,000 marks in 1914 to 72,223,000,000 marks in Aug. 31, 1920. In respect to commerce imports played the principal part and manufactured products were for the most part exported but Germany had great natural resources especially in coal and potash. The report

complained that the Treaty by imposing unlimited obligations had aggravated the economic crisis, and the report insisted that Germany must be in a condition to import more extensively than ever her raw materials and to export at the earliest possible moment her manufactured articles. These products would serve to make the payment of the debt possible. Imports had been unduly increased by the bringing in of useless articles of luxury and the government had measures in view against this practice. The report concluded with the remark that only vague guesses could be made in respect to the final development of German foreign trade. No great progress could be made toward a sound commercial condition till Germany succeeded in keeping down to the lowest point possible her own needs and increasing at the same time the production of German goods.

FINANCIAL SITUATION IN OCTOBER. According to the finance minister, the debt on September 18th was 242,700,000,000 marks, made up as follows: Funded debt, 91,000,000,000 marks; discounted treasury receipts and bills, 132,300,000,000 marks; additional obligations, 19,400,000,000 marks. The floating indebtedness to be taken over from the German states and the capitalization of the interest due for the surrender of the state railways came to 25,000,000,000 marks; and in addition there were 18,000,000,000 marks due the states for war expenses. The condition of the finances was reported to be exceedingly confused in October and the cabinet decided, October 10, to appoint a financial expert, Dr. Carl, who had served in the Prussian Finance administration, to audit the expenditures of the various departments. The deficit in the budget for 1920 was estimated at 67,000,000,000 marks and critics complained that this had been caused largely by reckless spending. By October 1st, the paper money in circulation was placed at 80,000,000,000 marks and in the latter part of September, the national debt was reported by the Germans at the financial conference in Brussels to be 240,000,000,000 marks. To this certain outstanding obligations were added by financial writers to the extent of 131,000,000,000 marks, bringing the total national indebtedness up to 416,000,000,000 marks.

RAILWAYS. The railway mileage Jan. 1, 1920, was placed at 38,809 of which 36,000 were state lines. The central government assumed control over all German state railways on April 1, 1920. During the year the attention of economists was directed to the conditions of railway operation in Germany, before, during, and after the war. The financial condition and operating expenses and receipts were summarized in a published statement. Here it was shown that during the last peace year the expenses of the German railway systems amounted to 2,345,000,000 marks, were covered by a total revenue of 3,347,000,000 marks, affording a surplus of about 43 per cent. In the following three war years both expenses and revenues increased, but the expenses never exceeded the revenues. In 1915 the receipts were 3,268,000,000 marks and the expenses 2,338,000,000 marks, giving a difference of about 40 per cent. In 1916 the receipts amounted to 3,805,000,000 marks and expenses to 2,724,000,000 marks, a difference of 40 per cent, and in 1917 the receipts amounted to 4,435,000,000 marks and expenses 3,648,000,000 marks, a difference of 21.6 per cent. The year of the revolution, 1918,

ended with increased total revenues amounting to 4,617,000,000 marks, but the expenses exceeded the receipts by 1,324,000,000 marks, or 28.7 per cent, amounting to 5,941,000,000 marks. During the year 1919, in spite of the increase in passenger rates, the expenses were 11,040,000,000 marks, which again exceeded the revenues by 4,366,000,000 marks, or 65 per cent.

For the year 1920 revenues were estimated at 14,344,000,000 and the expenses were set at 16,935,000,000 marks.

ARMY. The terms of disarmament imposed by the Treaty will be found in the article *WAR OF THE NATIONS* in the preceding *YEAR BOOK*. From the moment they came into force with the ratification of the Treaty by Germany Jan. 10, 1919, down to the close of the year 1920, there was constant complaint especially on the part of French public men that Germany was not faithfully executing them and the year 1920 closed with specific charges to that effect by Marshal Foch. The latter charges together with the main points in the discussion throughout the year 1920 will be found in the article *WAR OF THE NATIONS* in the present volume. (See also below, under *History*.) Down to the beginning of 1920 the following steps were reported to have been taken by Germany towards disarmament: The reduction of the Reichswehr began in August, 1919. At that time it comprised 43 brigades of all arms, 3 marine infantry brigades stationed at Berlin, Hamburg, and in Upper Silesia, and a coast-guard regiment in the northeast ports. Early in 1920 the Reichswehr was reported at a strength of 200,000 men and the land marine forces at 12,000, both of these forces being under the Ministry of Defense. There began in 1919 certain organizations under the Ministry of the Interior which occasioned much complaint on the part of Allied critics as forming the nucleus of a real military force. It was alleged that preparations were being made under cover for the establishment of an armed force that would serve the purpose of a regular army when the need arose. An organization known as the public safety police was created with a strength placed at 50,000. The civic guards were estimated at 350,000 and the emergency volunteers at 150,000. The public safety police were armed and equipped and distributed in the chief cities. The emergency volunteers were organized for the purpose of maintaining order under the civil government and also serving as a reserve to the Reichswehr. Arms were stored for them at Reichswehr brigade headquarters, but were not distributed. The civic guards also unarmed, but with rifles and revolvers stored for them, were to serve for the maintenance of order under the civil government in the localities. Allied critics charged that the raising of these forces was contrary to the terms of the Treaty which prohibited military associations of civilians or reservists. The Treaty provided that after April 10, 1920, the civic guards or police force should exist only so far as they had existed in 1913 with such increase as kept pace with the growth of population. Throughout the concluding months of 1920 it was charged that these terms were violated and the charge was denied with equal emphasis by the German authorities.

NAVY. The armistice and the Treaty destroyed the German navy as a fighting force. What remained of the fleet was lost by the scuttling of vessels interned in the Scapa Flow June 21, 1919,

when the following vessels were sunk: 10 battleships, 5 battle cruisers, 5 light cruisers and 30 destroyers. The Allies claimed reparation, which was made in 1920 by the German government's turning over various maritime material. Other vessels were surrendered by Germany to the Allies. By the terms of the Treaty a navy recruited by volunteers was permitted to the following extent: 6 battleships of the pre-dreadnought type, 6 light cruisers, 12 destroyers, and another 12 destroyers unless an equal number of ships should be built to replace them; total personnel not to exceed 15,000; no submarines to be built. The National Assembly in 1919 passed an act creating a navy on the basis of volunteers for the protection of the coasts and fisheries, police service, and the removal of mines, and on Sept. 3, 1919, an order for the enlistment of naval volunteers was issued.

On September 16th it was announced in Paris that Germany had by that time surrendered steamships and sailing vessels with a gross tonnage amounting to 1,944,565 which practically completed the delivery of the tonnage due under the Treaty.

GOVERNMENT. The new constitution of Germany which was promulgated Aug. 13, 1919, is outlined in the preceding YEAR BOOK. Executive power is vested in a president to be elected by the entire people for seven years and in a ministry appointed by him but responsible to the Reichstag. Legislative power is vested in the legislature or Reichstag elected by universal, equal, direct, secret vote of male and female electors on the principle of proportional representation, and in an imperial council or Reichsrat consisting of the representatives of the component states. The consent of the latter house is required to all bills before they are introduced into the Reichstag. The composition of the Reichsrat was as follows: Prussia, 25 members; Bavaria, 7; Saxony, 5; Baden, 3; Württemberg, 3; others, 20; total, 63. President at the beginning of 1920, Friedrich Ebert.

The Bauer ministry was in power at the beginning of the year. It had been constituted, June 21, 1919, as follows: Chancellor, Dr. Gustav Bauer (Socialist); Foreign Affairs, Dr. Hermann Müller (Majority Socialist leader); Vice-Chancellor, Herr Erzberger; Interior, Dr. David; Economics, Herr Wessell; Labor, Herr Schlicke; Finance, Herr Meyer; Posts and Telegraphs, Herr Giesberts; Colonies, Dr. Paul; National Defense, Herr Noske; Food, Dr. Robert Schmidt. For new ministries, see below under *History*.

HISTORY

INDUSTRIAL UNREST. Labor difficulties were constantly threatened during the year. The danger of control by the revolutionary element added greatly to the seriousness of strikes and all other labor disorders. A serious railway strike occurred in Westphalia in January. At the same time the government had to contend with the demand of its functionaries for increased wages and with the attempts of radicals to stir up revolts among the workingmen. The Communists and other radical groups were endeavoring to control the industries. When the Works Council bill which had been proposed by the government for the establishment of workingmen's councils under state control was under discussion, the radicals made an attempt to force the government's hand. An attack was made

on the government building which was defended by means of machine guns and rifles. It was repulsed with a loss of 42 persons killed, and 105 injured, and martial law was again proclaimed. The Works Council bill was passed on February 4th. Its principal feature was representation of workingmen's delegates in the management of factories and other industrial plants.

THE KAPP ATTEMPT AT COUNTER-REVOLUTION. Suddenly in March, a counter-revolution surprised the government by an attack on Berlin. The malcontents under the head of Dr. Wolfgang von Kapp, and made up apparently of monarchists supported by the Pomeranian Land League and by monarchist sympathizers generally, sent a body of troops on March 13th into the city of Berlin. Gen. Von Lüttwitz, who had charge, seized the public buildings and principal strategic points of the city and compelled the President and government to take flight, first to Dresden and later to Stuttgart and for five days the monarchists were in possession of Berlin. In north Germany, government troops refused to fight the rebels, but in south and west Germany there was determined hostility to the movement. In general, there was little sympathy with the counter-revolutionists throughout the country. Dr. Kapp declared himself imperial chancellor and made Baron von Lüttwitz commander-in-chief of the army. Various proclamations were issued with a view to placating the Socialists and gaining the confidence of the people. The Ebert government met the new movement by declaring a general strike. It was soon evident that the scheme of the counter-revolutionists had been ill conceived, and by March 15th its failure was assured. There followed an attempt on the part of the radicals to get the upper hand of the Bauer ministry. Its prestige and authority were diminished. Herr Noske who had repeatedly been hailed as the strong man of the government was forced to resign, being accused of favoring the reactionary and military element in his struggle against the Independent Socialists and the Communists. Unable to cope with the opposition of the extremists, faced with the danger of armed resistance on the part of the workingmen in the Ruhr district, and unable to satisfy the demands of the trade unions (see below), it fell from power, March 26. The trade unions had demanded among other things that they should have the right to choose members of the cabinet, and direct legislation, and that all persons guilty of taking part in the recent counter-revolution should be prosecuted and punished. The President of the republic, Ebert, chose as Prime Minister the Socialist deputy, Dr. Hermann Müller, who was the third incumbent of the office of Chancellor in the new republic.

THE MÜLLER MINISTRY. The ministry though formed largely under trade union influence was a coalition of Socialists, Democrats, and Centrists. It was made up as follows: Dr. Hermann Müller, Chancellor; Herr Lansberg (Socialist), Foreign Affairs; Dr. Bauer (Socialist), Finance; Herr Wirth (Democrat), Treasury; Dr. Blunck (Centrist), Justice; Herr Koch (Democrat), Interior; Herr Gessler (Democrat), National Defense; Herr Schmidt (Socialist), Economics; Herr Hermes (Centrist), Food; Herr Schlicke (Socialist), Labor; Dr. Bell (Socialist), Transportation; Herr Giesberts (Centrist), Posts and Telegraphs; Dr. David (Socialist), without portfolio. The programme was presented March 29th.

The government inveighed against the parties of the Right whom it accused of being responsible for the Kapp revolt and its bad consequences. The plans of those who wanted to increase the German army in defiance of the Treaty were denounced and the government declared its intention to punish both military and civil reactionaries. As to other policies, they included in general an application of democratic principles to the civil service and an extension of social legislation including the carrying through of the arbitration bill and the taking over by the empire or by the governments of states and cities of those industries which were ready for socialism.

THE RUHR DIFFICULTY. The Kapp revolt was followed by disorders throughout the country, especially in the mining region of Westphalia and the Ruhr Valley, when a state approaching civil war was reported. The Communists having overthrown the local police had taken possession of the towns and mines. This threatened revolution in the Ruhr district which had been one of the causes of the fall of the Bauer ministry was the first problem to engage the attention of the new Müller cabinet. Against the Red army which had been organized there, government troops were dispatched at the beginning of April. This caused the action on the part of France which for a time seemed to threaten disunion in the council of the Allied Powers (see **WAR OF THE NATIONS**). The Ruhr district is situated in the zone defined by the Treaty as neutral. The French government alarmed by the presence of German troops there, dispatched French troops to occupy German cities. General Dongoulette entered Frankfort and Darmstadt, April 6; and subsequently the cities of Hamburg, Hanau, and Dieburg were also occupied by the French troops. The French government declared at the same time that the occupation was a purely precautionary measure whose only object was to insure German respect for the Treaty (April 6), but there were frequent protests in Germany against its action. Law and order were restored in the Ruhr district by April 15th. After the conference of San Remo in April it was agreed among the Allies that the French troops occupying Frankfort and the other cities should be withdrawn as soon as the German troops had been reduced to the limit fixed by the Treaty. The German forces in the neutral zone along the Rhine were cut down and the French troops holding Frankfort, Darmstadt, Hanau, Dieburg, and Hamburg were withdrawn, May 17.

ALLEGED GERMAN-HUNGARIAN PLOT. At the close of the year the London *Times* gave an account of the designs formed at the time of the Kapp counter-revolution to place Europe under German dominion. According to this, efforts were made to induce Hungary to join in a German-Russian combination to prevent the execution of the Treaty. It was said that Admiral Horthy had been approached by German delegates who wished him to enter into an agreement for the admission into Hungary of German soldiers as immigrants, and for the training of Hungarian soldiers in the German manner, so that along with German forces they would be ready when the time came to invade Austria, seize Vienna, and set up there a military dictatorship and a provisional government. Other features of the alleged plot included a march upon Berlin by way of Bohemia and Saxony and in case of the resistance of the Czecho-Slovaks, the sending of

Prussian troops from Silesia and Pomerania who would be reinforced by the Russians. When Germany was once regained, a military dictatorship would be set up there under General Ludendorff and measures would be taken to support White Russia in the reconquest of the Russian empire. The alleged conspiracy included a plan attributed to Admiral Horthy for remaking the map of Europe along the following lines: Germany to receive Alsace-Lorraine, the southern part of Belgium, and the north of France; the Netherlands to receive the northern part of Belgium; Denmark to be incorporated in Germany; German-Austria and the German portions of Bohemia to be assigned to Germany; Poland to be divided between Russia and Germany, Russia to have her former frontier and besides that to include Anatolia, Armenia, Persia, and Mesopotamia, etc. Many further details all to the same effect were alleged in the account of the conspiracy, which was to culminate in an offensive against France in 1921.

FRENCH ARMY OF OCCUPATION. As to the conduct of the French troops of occupation there was little complaint, but much was made of the employment by the French of their colored troops from the colonies and there were frequent charges that the soldiers had attacked women and girls. These charges were denied by the French and military authorities and by Prime Minister Millerand, who showed that less than 7500 negroes were among the 85,000 French soldiers in the occupied regions. Nevertheless on May 29th it was announced that the black troops were soon to be withdrawn.

DISARMAMENT. It was evident at the time of the Ruhr difficulty that the German forces were in excess of the numbers allowed by the Treaty. They were constantly reported to be in excess down to the closing months of the year and the matter was agitated incessantly in the French press. On the other hand, the Germans repeatedly asserted that they were carrying out to the utmost of their ability all the terms in respect to disarmament. In general the contention of Germany's critics was that she was secretly maintaining forces which would serve eventually as a regular army; this the Germans steadily denied. See **WAR OF THE NATIONS**.

POLITICAL PARTIES. The general elections had been postponed and this fact was one of the influences that had hastened the Kapp counter-revolution. They were fixed for June 6th. The nature of the programmes of the various political groups during the electoral campaign was as follows: The German National People's party, formerly the Conservatives, demanded the restoration of German unity; return of the monarchical government; the fostering of national spirit among Germans living abroad; the return to Germany of her lost territories and colonies; and the pursuit of a vigorous foreign policy. The German People's party, formerly the National Liberals, demanded the repression of Bolshevism; the employment of experts and of non-partisans in the government; the creation of a labor chamber; and the revision of the Treaty. It emphasized private initiative against the collective motives of Socialism and demanded coöperation of all parties toward the restoration of economic life based on truly German ideals. The Centre attacked Communism on the one hand and the Kapp counter-revolution on the other, and calling itself the party of constitutional loyalty, in-

sisted on the maintenance of the constitution by armed forces if necessary and the suppression of any revolt on the part of revolutionists or reactionaries; denounced class hatred and class rule and insisted on equal rights for all. The Democratic party, formerly the Progressive People's party, also called for the coöperation of all classes. It demanded the restoration of German industry, religious freedom, secularization of public schools, personal initiative and individual reward as against the collective spirit of Socialism; a genuine League of the Nations, including Germany; and the revision of the treaties with Germany and Austria. It opposed national centralization and insisted upon economy in national finance. The Social Democratic party consisting of the Majority or Moderate Socialists, called for socialization of industry by popular will, heaviest possible taxation of capital, and centralization of power, and denounced the schemes for the restoration of monarchy. The Independent Socialists, the Left wing of the Social Democratic party, demanded a national army of workingmen, liberation of persons arrested for radicalism, disarming and punishment of counter-revolutionists, socialization of all industries, and government seizure of large estates. The Communists, the extreme Left, demanded complete abolition of capitalism, and the suppression of the power of the middle class and discredited the use of parliamentary methods. Of the above parties, the only one that pronounced itself frankly in favor of fulfilling the terms of the treaty was the Independent Socialists, although the Majority Socialists had declared that one of the purposes of the heavy taxation of capital was that the terms of the Treaty might be fulfilled.

ELECTIONS. In the June elections held under the new franchise law, over 25,000,000 votes were cast and 470 members of the Reichstag were elected. The apportionment among the various party groups with the popular vote of each was as follows: Majority Socialists, 110 (popular vote 5,531,137); Independent Socialists, 80 (popular vote 4,809,862); Centrists 67 (popular vote 3,500,800); German Nationalists, 65 (popular vote 3,638,851); German People's party, 61 (popular vote 3,456,131); Democrats, 45 (popular vote 2,152,509); Christian Federalists (Catholic Conservative party of the Rhineland), 21 (popular vote 1,254,963); Guelphists, 5 (popular vote 318,104); Communists, 2 (popular vote 438,199); Bavarian Peasants' party, 4. In Greater Berlin, the municipal elections held in June, gave the two Socialist groups in the city council 125 out of 225 seats.

NEW MINISTRY. A week after the elections the ministry retired and was succeeded by a new cabinet under Konstantine Fehrenbach as Chancellor. He had formerly been president of the Reichstag. On June 25th he formed a ministry out of representatives of the Democratic, Catholic, and People's parties, which was constituted as follows: Chancellor, Herr Fehrenbach; Minister of Justice and Vice-Chancellor, Herr Heinze; Foreign Affairs, Dr. Walter Simons; Finance, Dr. Wirth; Interior, Herr Koch; Defense, Herr Gessler; Transport, General Groener; Food, Herr Hermes; Posts and Telegraphs, Herr Giesberts; Economics, Herr Scholz; Treasury, Herr von Raumer. The new Reichstag met June 25th, and chose as president, Paul Löbe, a Majority Socialist and as vice-president, Wilhelm Dittmann.

ECONOMIC CONDITIONS. At the beginning of

October it was estimated that about 1,000,000 persons were unemployed and 1,500,000 working only half time. At the same time enormous profits were attributed to various industrial plants, especially to the textile mills. A plan was undertaken in September by the Minister of Economics for socializing in part the coal mines and there were reports that a plan for the conscription of labor was under consideration. Other plans proposed were the lending of money to small manufacturers by means of municipal savings banks, measures for nationalization of mines, etc. A great meeting of representatives from the shop councils established by national law in 1919 was held in the autumn, comprising some 1100 delegates, who represented about 8,000,000 organized workers and 15 leading groups of industries. The spirit of the congress favored the adoption of measures for extending workingmen's control over industries, but the extreme views of the Communists did not prevail and the control of the congress remained in the hands of the Majority Socialists and the Independent Socialists. (See SOCIALISM.) There was a strike early in October on the part of the clerical force engaged on the non-Socialist newspapers of Berlin as a protest against the proposed reduction of wages, and it resulted in a victory for the strikers. Strikes on the street car lines were reported in Berlin, Dresden, and Leipzig. There was some distress at this time owing to the shortage of potatoes and it was found that the cessation of government control of trade in potatoes had not had satisfactory results. It was also reported by the national grain bureau that the grain crop would not suffice for domestic needs, but would amount only to about 7,000,000 tons, and that 2,000,000 tons of breadstuffs would have to be imported. The rye crop was also disappointing.

FINANCIAL CONTROVERSIES. The condition of the German finances was a subject of endless discussion and as fast as any statement was made by the Germans to the effect that they were in no condition to pay their obligations direct contradictions appeared in the French press. (See above paragraphs on *Finance*; and *WAR OF THE NATIONS*.) In October a leading German newspaper commenting on the proposal that Germany should declare herself bankrupt, said that in that case the foreigners, sustained by the Treaty, would immediately seize upon the financial organs of Germany and administer German finances in their own interests. In France the view was held that Germany had brutally abused this argument of insolvency; that it was simply a part of her plan to prevent the execution of the Treaty. Thus it was said that after the conference of Spa, the German press had begun a campaign against the provisions of the Treaty in respect to coal, although many Germans admitted that these clauses could be readily executed if the government so desired. The events showed that the clauses could be executed. It had already been said by a prominent German financier that the means by which German statesmen were trying to prove that they could not pay the indemnity were ridiculous, and along with other experts he published estimates in June, 1919, showing that an indemnity of 1,000,000,000,000 marks did not exceed the financial capacity of the country. French commentators contrasted this estimate with that of Mr. Keynes in his widely read book on *The War and Economic Reconstruction* in which he estimated that Ger-

many, at the most, could pay 2,000,000,000 pounds sterling which was subject to various reductions. It was pointed out that since the German financier had shown that Germany could pay more than twice that, it followed that Mr. Keynes was more than twice as German as the Germans themselves. In short, Germany was not insolvent but was making every effort to appear so. It was true that a considerable amount of assets had been sequestered in the countries of the Allies during the war. Nevertheless, even if Mr. Keynes was trying to exaggerate the liabilities of Germany, he had admitted that foreign securities in the possession of Germans and immediately available, amounted to no less than 250,000,000 pounds sterling.

SAXONY. In the elections of November, the Majority Socialists lost nearly one-half of their strength, having 27 representatives in parliament as compared with 42 before. The bourgeois parties elected 47 deputies. The popular vote, however, stood 1,029,083 for the parties of the Left, and 1,011,108 for the bourgeois parties.

BAVARIAN MOVEMENT FOR FEDERALISM. Some alarm was felt in government circles at Berlin at the growth of the Bavarian demand for a reconstitution of the empire. In October a congress of the Bavarian popular party was held at Bamberg, at which a programme of federalism was proposed. The congress while declaring its loyalty to the empire demanded the establishment of a federal system with equal representation of the several states, as in the former Bundesrath, but without the preponderance of Prussia. Each state was to determine its own constitution and government. Imperial laws were to apply only through the laws of the states and the functions of the imperial government were to be adapted to the administration system of each state. The several states were each to have the right to conclude treaties, send their own representatives to foreign countries, determine and execute their own financial policies, and to control their respective contingents to the imperial military and police forces. This plan, supported by the strongest party in Bavaria, was in effect a condemnation of the Weimar constitution. Attacks were made upon it by the leaders, who declared that the centralized system set up by the Socialists had brought about a condition of political chaos and was not to be endured. A federal system was demanded because it alone would save the empire from disintegration, and because also it would afford the means of solving the problem of Austria. The more conservative elements in Bavaria were behind the movement and it had the support of influential French journals, which here, as everywhere else, took the side of those who tended toward reaction. On November 16th it was reported that the country was in danger of a revolution on the part of the right wing or monarchists for the purpose of setting up an independent state free from German control, under a regency which might when desired give place to a king, and form an alliance with France. It was said at the time that the new movement was relying on France for aid, French propaganda having been carried on there for a long time successfully.

MAXIMILIAN HARDEN. The celebrated director of *Zukunft* whose fearless criticisms of the government were frequently quoted in the Allied press during the war became again the subject of wide comment on his attacks on the policy of

the party in control. The articles written by him were widely quoted in October and November. They again showed him on the side of the Allies. He characterized the war as a tragic blunder. His view was that the Emperor was not responsible, but had been dragged into the war by the military party. He himself would never have dared to embark upon it, being too cowardly, as he had clearly shown by his flight. Harden described him as a comic actor and said said they made the mistake in France of taking him seriously. As to the German atrocities during the war, he declared that the charges in respect to them were all true. He reported an interview with William in which, he said, the latter had asked for details in regard to the cruelties committed by Germans and when Harden gave him a list of these he exclaimed that he had known nothing about them at the time. "Who would have supposed," he said, "that German officers who were men of refinement would have acted like criminals of common law, and yet, it is the truth," he added. The Emperor went on to say that he had refused personally to sign the famous manifesto of the intellectuals and that he had always believed that German troops had violated the neutrality of Belgium. As to Germany's payment of the indemnity, Harden maintained that it was impossible. It would be useless to turn Germans into slaves for several generations and that was what this demand really meant.

GERSTER-GARDINI, ETELNA. (MADAME GARDINI). Hungarian singer, died at Bologna, Italy, August 20. She was born at Kaschau, Hungary, in 1855, studied in Vienna, and made her first appearance in 1876 in the opera *Rigoletto*. She afterwards sang with great success in France, Italy, and Germany, and in 1878, 1883, and 1887 made tours of the United States as well. In 1896 she opened a singing school in Berlin. She was connected with the Institute of Musical Art in New York City after 1905.

GHEEN, EDWARD HICKMAN. American naval officer, died at Washington, D. C., August 10. At the time of his death he had the rank of rear-admiral. He was born in Delaware County, Pa., Dec. 11, 1845; graduated at the Naval Academy, 1867; and had risen to the rank of commander, March 28, 1898. He had meanwhile served on the flagship *Tennessee*, on the *Yantic* in the North Atlantic squadron, and on the *Minneapolis*, also at various shore duties, including work in the hydrographic office and the Philadelphia navy yard. He commanded the *Frolic*, June 23 to Sept. 27, 1898, and the *Marietta* in the Asiatic station, June 20, 1899 to April 29, 1901. He was afterwards engaged in lighthouse inspection duty and naval recruiting.

GIBRALTAR. A narrow peninsula on the southwest coast of Spain which commands the entrance to the Mediterranean; comprising the Rock of Gibraltar, a British crown colony. Area of the colony, $1\frac{3}{4}$ square miles; fixed civil population, estimated Jan. 1, 1919, 16,096 (7828 males and 8268 females), comprising for the most part descendants of Spanish and Italian settlers; alien population about 1867. The religion of the permanent inhabitants is for the most part Roman Catholic. The colony contains 16 government-aided elementary schools and a number of private English schools. In 1918-19 the pupils numbered 2603. Revenue (1918), £158,694; expenditure, £133,387; total tonnage

entered, 17,271,975; cleared, 16,044,352. The commerce consists chiefly of transit trade and the supplying of coal to ships. Gibraltar is a coal- ing station and important naval base and a valuable strategic point.

GIBSON, MARGARET DUNLAP. British Oriental scholar, died, January 11. She was born in Scotland and in 1883 married Rev. Thomas Young Gibson, translator of Cervantes' poetry; and traveled in the Near East, visiting Sinai six times. She edited Arabic versions of St. Paul's Epistles; the Acts, etc., and published a catalogue of Arabic manuscripts, volumes of Arabic and Sinaitic apocrypha; and various learned works on both languages; also commentaries on the Acts (1913); and on St. Paul's Epistles (1916). In 1915 she was medallist of the Royal Asiatic Society.

GIDDENS, GEORGE. Actor, died in New York City, November 21. During nearly 60 years he was a prominent figure on the stage, being regarded at the height of his career as one of the leading actors in low comedy parts. He was born at Bedford, England, June 17, 1855; educated at the national schools and entered upon a theatrical career at Edinburgh. He came to the United States with Sir Charles Wyndham in 1871, remaining here for several seasons. He was in the Criterion Theatre until 1894 and became one of the favorites of the English stage. After 1896 he spent the greater part of his time in the United States. Among the many plays in which he appeared with success may be mentioned: *Dandy Dick Cyrano*, *The Noble Lord*, *Pomander Walk*, and *Daddies*.

GIFTS AND BENEFACTIONS TO COLLEGES AND UNIVERSITIES. See UNIVERSITIES AND COLLEGES.

GILDEA, Sir JAMES. British philanthropist, died in London, England, November 6. He was born at Kilmaine, Ireland, June 23, 1838, and was educated at Cambridge. In the Franco-German war, he was active on behalf of the society for aid to the sick and wounded and he subsequently raised funds for the relief of dependents on the victims of the Zuhur War and the Afghan War. He was treasurer of these funds and of others for Indian relief and he founded the Soldiers' and Sailors' Families' Association, of which he was chairman after 1886. In 1914-17 £2,500,000 was placed in the hands of this association which meanwhile had developed many branches and become an elaborate organization. His writings include treatises on the Order of St. John of Jerusalem, The St. John Ambulance Association, and other subjects connected with philanthropic activity, including the record of the work of the Soldiers' and Sailors' Families' Association, from 1885 to 1916.

GITTINGS, JOSEPH H. American organist and teacher, died in Pittsburgh, May 6. He was born in England in 1848. For over 30 years he was organist at the Third Presbyterian Church in Pittsburgh, and for 20 years professor of music at the Pennsylvania College for Women. As a local manager he introduced to Pittsburgh many of the most noted artists (Patti, Carrefio, Paderewsky, etc.).

GIUSTINIANI, PHILIP. See ROMAN CATHOLICS.

GLASS. See CHEMISTRY, INDUSTRIAL.

GLENCONNER, EDWARD PRIAULX TENNANT, First Baron. Lord High Commissioner to the General Assembly of the Church of Scotland, died

in London, England, November 21. He was the brother-in-law of the former premier, Mr. Asquith. He was born May 31, 1859; educated at Eton and at Trinity College, Cambridge, and studied law. Afterwards he traveled extensively in the East and in America. He sat in Parliament from 1906 to 1910 and was regarded as one of the wealthiest members of the House of Lords, the family fortune having come from the chemical industry. His estate included some 5200 acres. His sister, Margot, wife of Mr. Asquith, published a volume of memoirs much talked of in 1920.

GLENN, ROBERT BRODNAX. Former governor of North Carolina, died, May 16. He was born in Rockingham County, N. C., Aug. 7, 1854; studied at Davidson College, N. C., and the University of Virginia; and began the practice of law at Danbury, N. C., in 1878. He was a member of the State Legislature in 1881, United States district attorney, 1893-1897, and Governor of North Carolina 1905-09. He was one of the Democratic electors for Cleveland in 1884 and 1892.

GLOBE FREE CONCERTS. See MUSIC, General News.

GOFF, NATHAN. Former Senator, died, April 23. He was born at Clarksburg, W. Va., Feb. 9, 1843; studied at Georgetown College; served in the Union army during the Civil War, rising to the rank of major; and was admitted to the bar in 1866. He was Republican candidate for governor in 1876 and in 1881 and was appointed Secretary of the Navy in the Hayes cabinet. From 1883 to 1889 he was a member of Congress. From 1892 to 1911 he was United States Circuit Judge; from 1912-13 Judge of the United States Circuit Court of Appeals; served as Senator, 1913-19.

GOLD. UNITED STATES. The following preliminary figures for gold production in the year 1920 were supplied by the Bureau of the Mint and the United States Geological Survey:

State or territory	Gold Fine ounces	Value
Alaska	380,034	\$7,856,000
Alabama	10	200
Arizona	289,118	4,943,000
California	692,019	14,805,300
Colorado	368,298	7,613,400
Georgia	53	1,100

Compared with 1919 production these figures indicate reduction in gold output of \$10,824,000.

WORLD PRODUCTION. The production and distribution of gold was an important topic in economic discussion and in world industrial affairs generally in 1920. The estimated production for the year was \$339,400,000, the lowest amount since 1903, when it was \$329,475,400, and of more immediate significance a decrease of \$25,-

700,000 from \$365,166,077 in 1919, and \$380,924,700 in 1918. For the decline in 1920 the United States was responsible, as shown above, for \$10,824,000, but all of the gold producing countries of the world, with the exception of Canada which showed an increase of \$1,200,000, making its output some \$17,100,000, shared in the curtailment. But decreased gold production was not confined to 1920; it had been continuous since 1915, when it was \$473,124,590, amounting in five years to over \$130,000,000 or 28 per cent. In this decline the United States had participated to the extent of \$51,000,000 or nearly 40 per cent, while the decline in Africa was \$28,800,000 or nearly 22 per cent, and Australia showed a fall of almost the same amount or \$27,400,000. Russia of course in this interval dropped from \$28,000,000 to \$10,000,000. The Transvaal, Rhodesia, and other South African fields also shared in the decline but proportionately less. In other words the United States when the dollar remained at par was face to face with increasing production costs and could not participate in the exchange premium. The situation was one of great interest and accordingly attention may be directed with profit to the accompanying table included in an article on "gold" by H. N. Lawrie, Chief, Precious Metals Division of the American Mining Congress, in the Annual Review of the *Engineering and Mining Journal* (New York):

\$20.67 in the five year period 1915-20 it averaged but \$13.85. Therefore in order not to destroy the gold mining industry Representative McFadden introduced into Congress a bill aiming to restore for a period of five years the lost purchasing power by imposing for the benefit of the producer a tax of \$10 an ounce on gold for commercial purposes. It was feared that unless some remedial steps were taken that gold production in the United States would soon approach the vanishing point and there would be no encouragement for developing new deposits or for resuming work on those whose abandonment seemed necessary in 1920. In other words the gold industry required either a more rapid deflation than was taking place or else some artificial assistance until the normal should be reached. In fact there was a decreased metallic reserve balance in United States currency, 50 per cent of which was but paper promises to pay.

GOLD PRODUCTION OF THE WORLD, 1901-1920					
1901	\$260,877,429	1911	\$459,377,300
1902	298,812,493	1912	474,333,268
1903	329,476,401	1913	462,669,558
1904	349,088,293	1914	451,582,129
1905	378,411,754	1915	473,124,590
1906	405,551,022	1916*	454,176,500
1907	411,294,458	1917*	419,422,100
1908	443,434,527	1918	380,924,700
1909	459,927,482	1919	365,166,077
1910	454,213,649	1920	338,000,000

* As reported by the Director of the Mint. 1920 estimated.

Years 1915-1918-1919 from Report of the Director of the United States Mint. The 1920 estimate is by H. N. Lawrie.

With gold production so widely distributed and the dollar taking the place of the pound sterling as the world's standard it was but natural that the question of the low rates of exchange prevailing should affect the gold mining industry. Thus gold from Africa and Austria was sold on the basis of the United States standard, which with the advantage enjoyed by America meant a substantial premium in pounds for the producers, an advantage as already stated in which the United States producer did not participate.

The decline of value for gold in the United States can be appreciated from the statement that while its purchasing power in 1914 was

The Federal Reserve Board announced a net gain of \$106,600,000 in the stock of gold in the United States during 1920 as against a net loss for 1919 of \$291,700,000. Gold imports for 1920 amounted to \$428,700,000 as compared with \$76,500,000 for 1919, while gold exports amounted to \$322,100,000 as against \$368,200,000 in 1919. Of the total gold imports for the year 64 per cent came from Great Britain, which included \$108,500,000 formerly held by the Bank of England for the Federal Reserve Bank. Nearly 60 per cent of the gold exports for year were to Asiatic countries and of this nearly 30 per cent went to Japan. See FINANCIAL REVIEW.

GOLD COAST. A British colony of Africa on the Gulf of Guinea between the French Ivory Coast and Togoland with a coast line of 334 miles, comprising besides the colony proper, Ashanti, and a protectorate. Total area about 80,000 square miles: population, in 1919, 1,503,386, of whom the European in 1915 numbered 2206. The capital and chief town is Accra (19,585) and other large towns are Cape Coast Castle (11,364), and Secondee (7725).

The following table shows the imports, exports, revenue, and expenditure for 1915 to 1918 inclusive:

	1915	1916	1917	1918
	£	£	£	£
Imports *....	4,509,538	5,999,749	3,886,480	2,919,915
Exports *....	6,943,681	5,816,527	6,846,925	5,818,681
Revenue....	1,456,180	1,835,989	1,624,124	1,298,674
Expenditure.	1,627,015	1,465,946	1,424,279	1,809,486

* Including bullion and specie.

The chief imports in 1918 were cotton goods, machinery, spirits, hardware, carriages, building materials, soap, and oil; and the chief exports were cocoa, gold and gold dust, kola nuts, and rubber. The United Kingdom had the greatest share of the trade. The imports from the United Kingdom in 1918 were £2,125,002 and the exports to the United Kingdom in 1917 £3,588,743. The imports from the United States in 1918 were £615,673 and the exports to the United States in 1917 were £1,005,204. The recovery from the war was rapid as was indicated by the fact that the foreign trade of 1919 made a new record. During that year the value of sea-borne trade was \$91,221,525, an increase of 143 per cent over 1918. Deducting specie, etc., the total value of the commercial foreign trade was \$86,004,010, an increase of 161 per cent over the preceding year. The largest item was the export of cocoa, which amounted to \$40,283,444. The imports during 1919 amounted to \$38,670,010, as compared with \$15,851,438 in 1918. The chief increases in value were in cotton goods; bags and sacks; provisions; motor cars; flour; railway plant and rolling stock; bread and biscuits. In 1919 Great Britain supplied 74 per cent of the imports and the United States 21 per cent. In 1919 the United States for the first time received a larger portion of the cocoa exports than Great Britain. In that year Great Britain received 46 per cent of the total exports and the United States 32 per cent. The shipping entered and cleared in the foreign trade in 1918 had a tonnage of 983,994 of which 953,164 was British. There is a government railway 108 miles in length from Secondee to Coomassie, with branches of 19 miles and 5 miles respectively, and there is a line from Accra to Tafo, 65 miles in length. Further lines were in process of construction. Ashanti was annexed by Great Britain Sept. 26, 1901, and was placed under the same central administration as the Gold Coast, but with its own laws and ordinances. Its chief town is Coomassie, with a population of about 24,000. There is a considerable production of gold and a rich timber supply including valuable woods. The northern territories lie to the east and south of the French possessions and to the west of Togo. They were placed under British protection in 1901 and are directly under a chief commissioner whose headquarters are at Tamale. The governor of the Gold Coast at the beginning of 1920 was Brigadier-general F. G. Guggisberg.

GOLF. The growing popularity of golf was

attested in 1920 by the thousands of recruits gained by the sport and by the large number of new clubs which were organized especially in the United States. For the first time in many years the play had a distinct international flavor. The United States sent a team to England to take part in the English amateur championship while England in turn had representatives in both the United States open and amateur tourneys.

In the English amateur tilt Robert A. Gardner, U. S., was beaten in the final round by Cyril Tolley, England. The two players were all square at the end of the 36th hole, but the Englishman won out on the 37th.

The United States open tourney played at Toledo, Ohio, resulted in a triumph for Edward Ray of England, whose score was 295. Jock Hutchinson of the Glen View Club, United States, Harry Vardon, England, Leo Diegel, Lake Shore Club, U. S., and Jack Burke, St. Paul Club, U. S., each had a total of 296. Other scores were: Jim Barnes, Edgewater Club, 298; Charles G. Evans, Edgewater Club, 298; Robert T. Jones, 2d., Atlanta, 299; W. MacFarlane, Port Washington, 299; Robert McDonald, Bob O'Link Club, 300.

Charles G. Evans captured the United States amateur tourney, defeating Francis G. Ouimet in the final round by seven and six. Four British stars including Cyril Tolley, the British amateur champion, competed in this tourney but all were early eliminated.

The results of other prominent tourneys in the United States were:

Women's, Miss Alexa W. Stirling, Atlanta, defeated Mrs. W. A. Gavin, Bay Shore, L. I., 6 and 5; Western Amateur, Charles G. Evans defeated C. Wolff, 5 and 4; North and South Amateur, Francis G. Ouimet defeated S. J. Graham, 5 and 4; North and South open, Fred McLeod won with a score of 298; Southern Amateur, Robert T. Jones, 2d., defeated E. Watkins 11 and 10; Metropolitan Amateur, E. Sawyer defeated G. W. White at the 37th hole; Metropolitan Women's, Mrs. Q. F. Feitner defeated Miss Georgianna Bishop, 2 and 1; Metropolitan Open, Walter Hagen defeated Jim Barnes in play-off of tie, 70 to 74.

The English Open championship was won by George Duncan, with Sandy Herd second. Edward Ray finished third. Miss Cecil Leitch captured the Great Britain's women's title by defeating Miss Molly Griffith in the final round, 7 and 6; Walter Hagen, U. S., carried off the French open championship.

In the matches for the Leslie Cup Pennsylvania was victorious, defeating New York eight matches to seven. New York in the meantime had triumphed over Massachusetts by the same score. The contest for the Devonshire Cup resulted in a victory for the United States over Canada by a score of 20 to 15.

Princeton won the intercollegiate championship with Dartmouth second and Harvard third. The individual winner was J. W. Sweetser, Yale, who defeated J. C. Ward, Williams, 4 and 3.

GONCOURT, PRIX DE. See FRENCH LITERATURE.

GONDRA, MANUEL E. President of the republic of Paraguay, inaugurated at Asuncion on August 15. He was born Jan. 1, 1872; educated at the National College; specialized in political subjects and wrote a number of valuable treatises within that field. He was minister to Brazil,

1905 to 1908, and Minister of Foreign Affairs, 1910 to 1918. For a short time he served as president, in 1910. In 1918 he was minister to the United States, holding that office at the time of his election. See PARAGUAY.

GOODELL, THOMAS DWIGHT. University professor and classical scholar, died, July 7. He was born at Ellington, Conn., Nov. 8, 1854; graduated at Yale College in 1877, and studied in Europe. He became assistant professor of Greek at Yale in 1888 and was made professor in 1893. In 1911-12 he was president of the American Philological Association. Besides Greek text books he published *Chapters on Greek Metric* (1901) and a Greek festival hymn for Yale University (1901).

GOODRICH, ALFRED JOHN. American authority on music, died in New York City, April 8. He was born at Chilo, Ohio, in 1847, and became a professor of musical theory, teaching in many of the leading musical institutions and serving for two years on the faculty of the Martha Washington College, Va. He wrote among other works, *Music as a Language* (1888); *Complete Musical Analysis* (1889); *Analytical Harmony* (1894); *The Theory of Interpretation* (1898); *Synthetic Counterpoint* (1903).

GOODYEAR INDUSTRIAL UNIVERSITY. See UNIVERSITIES AND COLLEGES.

GORDON, CLARENCE. Author, died at Sharon, Mass., November 26. He was born in New York City, 1835, and graduated from the Lawrence Scientific School in 1855. After living successively in Savannah and Boston, he settled in Newburgh, N. Y., where he remained until 1893. From 1894 to 1903 he was engaged in settlement work in New York City. He wrote a number of works of fiction including three juvenile stories under the pen name of "Vieux Moustache."

GORDON-BENNETT TROPHY. See AERONAUTICS.

GORGAS, MAJOR-GENERAL WILLIAM CRAWFORD. Surgeon-General, United States Army, from 1914 to 1918, celebrated as chief sanitary officer of the Panama Canal, died in London, July 4. His death followed a stroke of apoplexy on May 29. He was born in Mobile, Alabama, Oct. 3, 1854, the son of a general in the ordnance department of the Confederate Army; graduated at the University of the South in 1875, studied medicine in New York where he received his degree from Bellevue Hospital Medical College in 1879; was interne at Bellevue Hospital, 1878-80; and commissioned as surgeon in the medical corps of the United States Army, June 16, 1880. During the Spanish-American War, he served as major and brigade surgeon of volunteers, and was raised to the rank of major in the regular army, July 6, 1898. He was the chief sanitary officer of Havana from 1896 to 1902 and in this capacity he applied to measures of preventive sanitation the discovery of the late Major Walter Reed in regard to mosquitoes as carriers of yellow fever. It was reported that Havana was freed from the yellow fever after three months of his work. He was rewarded by promotion to the rank of colonel and appointed to the office of assistant surgeon-general by a special act of Congress, March 9, 1903. When the Panama Canal was undertaken, he was made chief sanitary officer March 1, 1904, and he there applied the same methods as he had employed

in Cuba, to the sanitation of the Isthmus which down to that time had been one of the plague spots of the world. Yellow fever was said to have been eradicated in less than a year and not a case of it was reported after May, 1906. He was a member of the Canal Commission from 1907 and was in charge of the administration until the winter of 1913. He then visited South Africa for the purpose of finding means of checking the spread of pneumonia among the natives working in the mines of the Rand. On Jan. 16, 1914, he was appointed surgeon-general and he was raised to the rank of major-general in 1915. His funeral took place at St. Paul's Cathedral, London.

GORIZIA. The Italian name of Görz, see GÖRZ AND GRADISCA.

GORZ AND GRADISCA. A crownland of Austria before the dissolution of the Austro-Hungarian empire at the close of 1918. For statistics see preceding YEAR BOOKS. After 1918 it was incorporated in the new state Jugo-Slavia.

GOUCHER COLLEGE. An institution of the higher learning for women, at Baltimore, Md., founded in 1885. The enrollment for the regular fall session was 834. There were 70 members in the faculty with three additions in the second semester. The productive funds of the institution amounted to about \$1,200,000 and the income for the year was \$262,000. There were 35,000 volumes in the library. The following additions were made: To Vanaheim Hall, laboratories for the Home Economics and Psychology departments and class rooms for the Mathematics department; and to Midgard Hall for the accommodation of 20 students. Four hundred thousand dollars was pledged by the General Education Board toward a total of \$1,000,000 to be raised for endowment. President, William Westley Guth, A.B., S.T.B., Ph.D., LL.D.

GOVERNMENT OWNERSHIP. See RAILWAYS.

GOW, ANDREW CARRICK. British painter, died, February 1. He was born June 15, 1848; became a member of the Royal Academy in 1868, and after 1869 exhibited continuously at the Royal Academy, of which he became an Associate in 1881. A partial list of his paintings is as follows: "The Relief of Leyden" (1876); "No Surrender" (1878); "The Last Days of Edward VI" (1880); "Cromwell at Dunbar" (1886); "The Garrison Marching out with the Honors of War; Lille 1705" (1887); "Flight of James II. after the Battle of the Boyne" (1888); "After Waterloo" (1890); "Queen Mary's Farewell to Scotland" (1892); "The Queen's Diamond Jubilee at St. Paul's"; "Nelson Cartoon" in the Royal Exchange, etc.

GOYON, ED. See FRENCH LITERATURE.

GRAHAM LAND. See FALKLAND ISLAND, DEPENDENCIES OF.

GRAND RAPIDS, MICH. See GARBAGE.

GRANT, NOEL. British naval officer, died at Stanmore, England, March 6. He was born in 1868 and became a commander, 1902, and captain in 1908. Through his skillful manœuvring, he won an engagement early in the war, when he was in command of the *Carmania*. On Sept. 14, 1914, his vessel was engaged with the *Cap Trafalgar*, the first instance in the war of a conflict between armed merchant vessels. Both vessels were well armed, but had no armor protection. The *Cap Trafalgar* was sunk in mid-Atlantic after an action which lasted about 2½ hours.

GRAPHITE. According to preliminary estimates of the United States Geological Survey there was a heavy decline in the production of graphite in the United States in 1919.

The shipments of domestic graphite amounted to approximately 7717 short tons, valued at \$743,000, a decrease of about 41 per cent in quantity and 51 per cent in value from the figures for 1918. After the War Industries Board, on Aug. 10, 1918, ordered the use of at least 25 per cent of American graphite in crucible mixtures to be sold during the year 1919, the purchases of domestic and Canadian graphite were heavy, reaching 500 tons or more a month during August, September, and October, 1918. After the armistice was signed, however, on Nov. 11, 1918, an abrupt decline in shipments began, which was accelerated by the order of the War Trade Board of Jan. 16, 1919, removing all restrictions on purchases of graphite. This order naturally weakened the market, for customers were then already burdened by accumulated stocks. The cost of manual labor in the United States increased enormously in 1918 and 1919, but as the demand for graphite was weak and as the market was thrown open to foreign competition the producers were unable to raise their prices proportionately. Although marine freight rates had been increased, the producers of crystalline graphite in Ceylon and of flake graphite in Madagascar, by reason of cheap native labor and unusual conditions of foreign exchange, were able to market their product at prices that forced the smaller American producers to suspend production, so that at the close of the year 1919 only the strongest and best organized companies were able to continue operations.

DOMESTIC GRAPHITE SOLD IN 1915-1919
(Short tons)

	Quantity	Total Value
1915	4,718	\$429,681
1916	8,088	935,471
1917	13,593	1,167,879
1918	12,991	1,524,254
1919	7,717	743,000

Artificial graphite may be used for any purpose for which natural graphite is employed according to the United States Geological Survey except in the manufacture of large crucibles. Patents have been issued, however, for methods of manufacturing crucibles in which artificial graphite may be used. Artificial graphite is peculiarly adapted to the manufacture of certain graphite products, among them graphite electrodes, which are not made from natural graphite and for which the demand has greatly increased in recent years.

The quantity of domestic flake and amorphous graphite sold by producers in the United States in 1920 amounted to 9510 short tons. The value of the graphite sold in 1920 was about \$626,201. Operators in Colorado, Nevada, and Rhode Island reported sales of 4694 short tons of amorphous graphite in 1920 at an average price of \$10.60 a ton. This was \$3.52 per ton less than the average price in 1919. The sales of crystalline graphite in 1920 amounted to 9,632,360 pounds, valued at \$576,442. Alabama led in the production of crystalline graphite, the sales in 1920 amounting to 4,894,648 pounds, or 51 per cent of the total quantity sold in the United States.

GREAT BRITAIN. UNITED KINGDOM OF GREAT BRITAIN AND IRELAND. A constitutional monarchy whose capital is London. The term

Great Britain though applying literally only to England, Scotland, and Wales, is often used as above to mean the United Kingdom. To the United Kingdom are attached the Isle of Man and the Channel Islands. With all its possessions or dependencies, that is to say, the dominions, colonies, and other territories subject to the ultimate control of Parliament, it constitutes the British Empire.

AREA AND POPULATION. The area of the United Kingdom is 121,633 square miles including the Isle of Man and the Channel Islands. The population as estimated for June 30, 1914, just before the outbreak of the war, was 46,089,249 of whom 36,960,884 were in England and Wales, 4,747,167 in Scotland, and 4,381,398 in Ireland. The civil population for England and Wales was estimated for June 30, 1919, at 35,993,000, and the population of Scotland and Ireland respectively at 4,894,100 and 4,380,000. For details of population based on the 1911 census see preceding YEAR BOOKS. The estimated population of Greater London (about 693 square miles) in 1919 was 7,258,623 (civil population only); of the administrative county of London, 4,358,309. The estimated population of the three next largest cities of England in 1919 (civil population only) was as follows: Birmingham, 861,585; Liverpool, 772,665; Manchester, 741,068. The estimated populations of the two largest cities of Scotland in 1918, were as follows: Glasgow, 1,111,428; Edinburgh, 333,883. The estimated populations of the two largest cities in Ireland in 1919, were as follows: Dublin, 399,000; Belfast, 393,000. The movement of population in England and Wales for 1919 (provisional figures) was as follows: Total births, 692,680; deaths, 504,254; marriages, 369,007.

For Scotland it was: Total births, 106,263; deaths, 75,141; marriages, 44,126. For Ireland it was: Total births, 89,555; deaths, 78,757; marriages (1918), 22,570. In 1919 the total immigration was 201,504 as compared with 22,824 the year before, and the total emigration 193,601 as compared with 25,970 the year before. The above figures, however, refer exclusively to passenger traffic. After April 1, 1912, revised lists were issued showing the number of British emigrants (excluding persons temporarily absent) to places outside of Europe. In 1913 these numbered about 390,000 and in 1918 only 10,600. In 1919 they rose to 147,000. The emigrants of British nationality numbered about 86,000 in 1913, fell to 8800 in 1918 and rose to 93,000 in 1919. The chief non-European countries of destination for British subjects in 1919 were: British North America (89,102); the United States (33,765); Australasia (17,757); India and Ceylon (10,841); and British South Africa (7761). The majority of the aliens in 1919 who took ship from British ports went to the United States (14,967). The number of native Irish who emigrated from Ireland from May 1, 1851, to the end of 1918, was 4,319,693. The number who emigrated in 1913 was 30,967 and in 1918, 980.

EDUCATION. On July 31, 1918, the number of elementary schools in England and Wales was 21,467 and the number of pupils enrolled Jan. 31, 1918, was 5,966,213. The average attendance in 1917-18 was 5,184,000. In Scotland the elementary schools in 1917 numbered 3363, with 743,725 in attendance. In Ireland in 1917 the elementary schools numbered 8060, with 699,472 pupils enrolled and 488,785 in attendance.

The attendance at the universities was greatly diminished during the war, but the figures increased afterwards. The following table from the *Statesman's Year Book* for 1920, estimates the number of members in the teaching staffs and the number of students in the universities of the United Kingdom in 1919-20:

Universities	Number of professors, etc.	Number of students
England—		
Oxford	100	8,600
Cambridge	150	4,360
Durham	171	1,200
London	913	6,000
Manchester	290	2,550
Birmingham	100	1,500
Liverpool	224	2,540
Leeds	215	1,760
Sheffield	146	8,500
Bristol	210	1,000
Total for England	2,519	28,010
Scotland—		
St. Andrews	84	420
Glasgow	164	3,900
Aberdeen	110	1,520
Edinburgh	242	4,800
Total for Scotland	600	10,140
Ireland—		
Dublin (Trinity College)	88	1,350
Dublin (National)	200	1,800
Belfast	73	1,050
Total for Ireland	361	4,200
Wales	220	2,500
Totals of above	3,700	44,850

PRODUCTION. The total produce of the United Kingdom by crops is shown in the following table in thousands of quarters and thousands of tons:

United Kingdom	Wheat	Barley or Bere	Oats	Beans
1912 ^a	7,087	8,204	20,660	954
1916	7,472	6,612	21,334	893
1917	8,041	7,185	26,021	474
1918	11,643	7,760	31,196	931
1919 ^b	8,669	7,215	25,461	...

^a Pre-war year. ^b Provisional.

The following table from the *Statesman's Year Book* for 1920 shows the number and size of the holdings in 1919:

Size of holdings, 1919	England and Wales	Scotland	Great Britain
1-5 acres	81,193	17,345	98,538
5-50 acres	191,875	32,711	224,086
50-300 acres	130,225	23,242	153,467
Over 300 acres	18,875	2,545	16,420
Total	416,668	75,843	492,511

Size of holdings	Leinster	Munster	Ulster	Connaught	Ireland
Not exceeding 1 acre	39,131	33,261	32,022	8,373	112,787
Above 1 and not exceeding 5 acres	13,085	9,678	16,887	8,469	47,619
Above 5 and not exceeding 10 acres	10,645	8,076	27,920	19,421	66,062
Above 10 and not exceeding 15 acres	8,211	7,062	25,072	19,411	59,756
Above 15 and not exceeding 30 acres	18,009	20,221	48,593	36,306	123,129
Above 30 and not exceeding 50 acres	13,268	20,494	24,555	14,071	72,388
Above 50 and not exceeding 100 acres	13,055	22,406	15,427	6,588	57,476
Above 100 and not exceeding 200 acres	6,889	9,789	4,112	2,369	23,159
Above 200 and not exceeding 500 acres	2,966	2,901	1,153	1,211	8,231
Above 500 acres	666	481	310	510	1,967
Total number of holdings	125,925	184,869	195,551	116,729	572,574

The above table, from the same source, shows the number and size of the holdings in Ireland in 1917.

See AGRICULTURAL EXPERIMENT STATIONS; AGRICULTURAL EXTENSION WORK; and AGRICULTURE.

The following figures for cultivated area live-stock and produce are from the *Statesman's Year Book* for 1920:

Cultivated Area	1918 Acres	1919 Acres
Corn crops ^a	10,950,985	10,093,243
Green crops ^b	4,085,164	3,894,590
Flax ^c	163,093	115,039
Hops ^d	15,666	16,780
Small fruit	90,939 ^e	84,632 ^e
Bare fallow	414,124	658,443
Clover and mature grasses ..	5,520,796
Permanent pasture	25,045,981
Total	46,266,748

^a Corn crops are wheat, barley, or bere, oats, rye, beans, peas. ^b Green crops are mainly potatoes, turnips and swedes, mangold, cabbage, kohlrabi, rape, vetches or tares. ^c Mainly in Ireland. ^d All in England. ^e Including Irish orchards.

The live-stock in 1919 are shown in the following table:

Live stock	1913 (pre-war) Number	1919 ^b Number
Horses ^a	1,874,264	1,914,933
Cattle	11,936,600	12,491,427
Sheep	27,629,206	25,119,220
Pigs	8,305,771	2,925,098

^a Horses for agriculture, mares kept for breeding, and unbroken horses.

COST OF LIVING. The following information in regard to the cost of living in 1920 was supplied by the United States Bureau of Foreign and Domestic Commerce: According to the preliminary figures issued by the British Board of Trade, the index number of wholesale prices in the United Kingdom for 1920 worked out at 371.4.

Peas	Potatoes	Turnips and Swedes	Mangold	Hay
423	7,605	25,313	9,276	15,395
261	5,469	23,318	9,010	15,198
278	8,604	24,842	10,369	13,163
441	9,223	22,835	10,821	12,332
...	6,311	22,823	7,795	10,717

This was the highest recorded in the statistics and shows a rise of 25 per cent compared with 1919. From the beginning until the middle of 1920 there was a general increase, but in August a decline set in and continued. The following table gives the index number for each year from 1871, calculated on the prices of 47 principal articles. It will be observed that, compared with the base

Year	Index No.	Year	Index No.	Year	Index No.
1871....	135.6	1889....	103.4	1907....	106.0
1872....	145.2	1890....	103.3	1908....	103.0
1873....	151.9	1891....	106.9	1909....	104.1
1874....	146.9	1892....	101.1	1910....	108.8

1887....	98.8	1905....	97.6	1920.....	371.4
1888....	101.8	1906....	108.8		

The coal and metals group, with the exception of copper, recorded advances, the index numbers for the group being 50 per cent above 1919, which itself was 36 per cent above 1918. Pig iron and coal advanced 28 per cent and 69 per cent, respectively, in 1920 over 1919. Raw textile materials were 36 per cent up compared with 1919. In the food, drink, and tobacco group the advance was nearly 20 per cent; British barley rose 17 per cent, beef by 20 per cent, mutton by nearly 40 per cent, sugar by 56 per cent, and tobacco over 36 per cent. Tea recorded a decrease. In miscellaneous articles, the rise of 10 per cent was mainly due to increases of 50 per cent in petroleum, 16 per cent in olive oil, 11 per cent in hides, and 28 per cent in bricks. On the other hand, cotton seed declined about 10 per cent and rubber 8 per cent—all comparisons on the 1919 numbers. Compared with 1913 the general index number in 1920 was nearly 219 per cent higher; coal and metals advanced 353 per cent; raw textile materials 276 per cent; food, drink, and tobacco 184 per cent; and miscellaneous nearly 222 per cent.

At the beginning of 1920 the cost of living, based on official average index figures, was higher than at the time of the armistice; subsequently these index figures indicated considerable appreciation, but at the close of the year tended to fall. During the closing months of 1920 there set in a certain amount of forced realization of accumulated stocks of various manufactured goods, with accompanying declines in wholesale prices, but for a considerable period little difference occurred in the retail charges. At the close of the year the cost of living was not only higher than at the time of the armistice but greater than at the end of September. See IRON AND STEEL, and PETROLEUM.

WAGES, ETC. Wage increases accorded to 7,600,000 workers in 1920 amounted to £4,693,000 per week—a record; for 1919 the corresponding figures were 6,160,000 workers and £2,432,000. These increases were distributed among the following trades:

Groups of trades	Work people affected		Weekly wage increase	
	1919	1920	1919	1920
Building	290,000	400,000	£205,000	£358,000
Mining and quarrying	1,160,000	1,280,000	620,000	1,328,000
Iron and steel smelting and manufacture ..	300,000	220,000	150,000	261,000
Engineering, shipbuilding, and other metal..	1,830,000	1,610,000	573,000	629,000
Textile	540,000	1,050,000	160,000	643,000
Clothing	490,000	720,000	174,000	229,000
Transport (excluding tramways)	370,000	890,000	96,000	573,000
Paper, printing, etc.	190,000	200,000	74,000	122,000
Chemical, glass, brick, pottery, etc.	220,000	270,000	64,000	120,000
Other trades	570,000	618,000	198,000	280,000
Public utility services *	800,000	850,000	118,000	150,000
Total	6,160,000	7,600,000	2,432,000	4,693,000

* Including tramway, gas, electricity, and water undertakings of both local authorities and private companies, and the road, sanitary, and other services of local authorities.

The figures for 1920 are provisional. As already mentioned, the year 1900 has been adopted as the base year of the series. The changes since that year in the index numbers of the 47 articles

embraced in the calculations, classified into four groups, are shown in the following table:

Year	Coal and minerals	Textiles (raw materials)	Food, drink, and tobacco	Miscellaneous	All articles
1900	100.0	100.0	100.0	100.0	100.0
1901	82.2	93.8	101.1	96.3	96.7
1902	76.1	92.8	101.4	92.5	96.4
1903	74.1	101.7	100.6	91.7	96.9
1904	70.9	112.9	101.2	88.3	98.2
1905	71.3	106.7	101.2	91.1	97.6
1906	73.8	121.1	101.0	95.6	100.8
1907	86.9	127.4	105.5	99.7	106.0
1908	78.5	109.8	107.0	94.8	103.0
1909	73.6	121.4	108.7	96.5	104.1
1910	76.6	136.2	109.2	104.3	108.8
1911	74.7	128.9	111.6	105.5	109.4
1912	84.9	119.6	119.9	110.1	114.9
1913	92.5	135.0	117.7	109.4	116.5
1914:					
Jan.-July ..	86.2	135.1	114.8	106.2	113.6
Aug.-Dec. ..	88.8	116.8	130.4	119.1	122.6
Year	86.7	128.8	120.9	111.3	117.2
1915	116.7	119.8	154.1	143.8	143.9
1916	165.8	180.1	189.4	204.0	186.5
1917	182.0	270.4	246.2	256.3	248.0
1918	204.9	354.4	259.3	268.6	267.4
1919	280.2	373.3	279.7	317.8	296.5
1920	419.3	508.1	335.1	352.2	371.4

In 1918 some 6,500,000 workpeople in these industries received advances amounting to about £3,200,000. In this connection the *Labor Gazette* said:

"The increase in numbers in 1920 as compared with 1918 is partly accounted for by the rise in the numbers employed in various industries as a result of demobilization and by the fact that, owing to the improvement in the numerical strength of the workers' organizations, larger numbers are affected by the changes in wages negotiated by such organizations, which form the great bulk of the changes recorded by the Ministry of Labor. But, even when due allowance has been made for these two factors, it is evident, from the great rise in the aggregate amount of increase recorded, that 1920 was a year of unprecedented advance in money rates of wages. It should be observed, however, that owing to the serious decline in employment in the closing months of the year actual weekly earnings in many industries were considerably lower at the end of 1920 than at the beginning of the year."

Following on the large reduction in 1919 in the hours of the working week, there was a further fall of 2,085,000 hours in 1920, the changes affecting 560,000 workpeople whose recognized full-time working week was reduced by an aver-

age of 3.7 hours. The outstanding reductions resulted from the adoption of a 44-hour week in the building trade in those districts in which it was not already in force, and of a 48-hour

week for workpeople in the wholesale clothing industry. The remaining changes resulted from the adoption of a shorter working week, usually of 48 hours, in a number of smaller industries. The following table shows the number of workpeople affected and the aggregate amount of the reduction in weekly hours in 1919 and 1920:

Groups of trades	Workpeople affected		Aggregate reductions in weekly hours	
	1919	1920	1919	1920
Building	211,000	282,000	965,000	994,000
Mining and quarrying	1,101,000	15,000	5,365,000	44,000
Metal	1,959,000	9,000	18,237,000	35,000
Textile	1,006,000	55,000	7,021,000	363,000
Clothing	214,000	130,000	1,052,000	422,000
Other trades	1,807,000	47,000	12,873,000	153,000
Public utility services	163,000	22,000	1,242,000	69,000
Total	6,461,000	560,000	41,755,000	2,085,000

The figures given relate to the normal hours of a full working week, and do not include the effect of the short-time working which, owing to the decline in employment, was in operation in many industries at the end of the year. See STRIKES AND LOCKOUTS; TRADE UNIONS; and UNEMPLOYMENT.

STRIKES AND UNEMPLOYMENT. The coal miners voted on March 10 at their national conference by a majority of 178,000 for a general strike and for direct action in order to enforce the nationalization of the mines. On the following day, however, the Trades Union Congress voted against this action by a majority of 2,820,000 and voted for legal political action by a majority of 2,717,000. In April the wages of the miners were increased by 20 per cent and soon afterwards the price of coal was increased. For further discussions of the coal strike, see the paragraphs on the *Government and the Coal Industry* under HISTORY below. As to the great railway strike of 1919, the agreement which had been called for in its settlement was concluded in January. This granted the railway men an increase of five shillings a week until Sept. 30 and then payment double the pre-war rate; accepted the principle of equal pay for the same work; and provided for periodical revision of the rate in response to changes in the cost of living. The railway unions demanded in April an all-round increase of £1 a week. The National Wage Board early in June granted increases ranging from two to 7 shillings over the existing rates. After the beginning of the coal strike, there was a great increase of unemployment in all industries. At that time it was estimated that about 4,200,000 persons were insured against unemployment under acts of 1911-16, of whom 114,771 were draw-

ing amount of unemployment and the government was engaged in measures to moderate its effects. The new Unemployment Insurance law went into effect November 8. By this, workmen who gained on an average less than about one thousand dollars a year were to receive assistance. It applied to about 12,000,000 workers over 16 years of whom 8,333,000 were men and 3,430,000 women. The fund is supplied by a contribution from the working people. Insurance was not to be paid for more than 15 weeks a year. This measure went considerably further than the previous one, which had applied only to about 4,000,000 workers. The former soldiers and officers constituted an unemployed class that gave considerable anxiety. In December it was estimated that about 295,000 ex-officers and ex-soldiers who had suffered injury were now capable of working, but were without employment, and a committee was actively engaged in trying to find situations for them. At that time over 20,000 business houses were inscribed in this movement to relieve the unemployment of the troops. The government had also taken measures to facilitate emigration of the troops and some 100,000 had already declared themselves willing to emigrate, the larger number choosing Canada and a considerable proportion choosing Australia, New Zealand, and South Africa. In many cases the new settlers took their families with them and it was estimated in December that no less than 150,000 persons had already emigrated or were about to do so. The government also placed at the disposal of the former soldiers lands in Great Britain having an area of about 170,000 hectares.

Toward the end of the year there was an alarm-

ing amount of unemployment and the government was engaged in measures to moderate its effects. The new Unemployment Insurance law went into effect November 8. By this, workmen who gained on an average less than about one thousand dollars a year were to receive assistance. It applied to about 12,000,000 workers over 16 years of whom 8,333,000 were men and 3,430,000 women. The fund is supplied by a contribution from the working people. Insurance was not to be paid for more than 15 weeks a year. This measure went considerably further than the previous one, which had applied only to about 4,000,000 workers. In December it was estimated that about 295,000 ex-officers and ex-soldiers who had suffered injury were now capable of working, but were without employment, and a committee was actively engaged in trying to find situations for them. At that time over 20,000 business houses were inscribed in this movement to relieve the unemployment of the troops. The government had also taken measures to facilitate emigration of the troops and some 100,000 had already declared themselves willing to emigrate, the larger number choosing Canada and a considerable proportion choosing Australia, New Zealand, and South Africa. In many cases the new settlers took their families with them and it was estimated in December that no less than 150,000 persons had already emigrated or were about to do so. The government also placed at the disposal of the former soldiers lands in Great Britain having an area of about 170,000 hectares.

ing amount of unemployment and the government was engaged in measures to moderate its effects. The new Unemployment Insurance law went into effect November 8. By this, workmen who gained on an average less than about one thousand dollars a year were to receive assistance. It applied to about 12,000,000 workers over 16 years of whom 8,333,000 were men and 3,430,000 women. The fund is supplied by a contribution from the working people. Insurance was not to be paid for more than 15 weeks a year. This measure went considerably further than the previous one, which had applied only to about 4,000,000 workers. The former soldiers and officers constituted an unemployed class that gave considerable anxiety. Year	Imports	Exports	Re-exports	Total exports
1913	£768,734,788	£525,253,595	£109,566,731	£634,820,326
1919	1,626,156,212	798,638,362	154,746,315	953,384,677
1920	1,936,742,120	1,335,569,027	222,405,957	1,557,974,984

ing insurance benefits, etc., August 1. The number rose to 159,277 October 1, and in one week from that time (October 8) rose to 288,291. Besides that, certain trades unions reported on October 1, that the number of their employed members would be 36,017. It was estimated that about 1,100,000 miners went out of work at the beginning of the strike. On October 20, the number of persons receiving the out-of-work donations and unemployment insurance rose to 444,405. Manufacturing interests now began to take active measures against dumping, that is to say, the importation of cheap foreign goods, and

The total of all foreign trade, therefore, rose from £1,403,555,065 in 1913, and £2,589,540,889 in 1919, to £3,494,717,104 in 1920. Whereas the excess of imports over all exports in 1913 reached £133,914,413, in 1919 the difference had increased to £662,771,535, but in 1920 this was reduced to a balance in favor of imports of £378,767,136. Both the total imports and the total of all exports in 1920 was approximately two and one-half times greater than in the pre-war year. Imports showed an increase in 1920 of £1,168,007,381 over 1913, and of £310,585,908 over 1919;

British exports rose in 1920 by £810,315,432 over the pre-war year and by £536,930,665 over 1919, while reexports of foreign and colonial goods

similarly advanced by £112,839,226 and £57,659,642, respectively. The accompanying tables show imports and exports by main classifications.

Items	IMPORTS		
	1918	1919	1920
Food, drink and tobacco:			
Grain and flour	284,408,247	£151,676,095	£231,712,529
Feeding stuffs for animals	4,869,758	11,811,258	8,899,297
Meat	56,421,848	175,415,708	141,557,025
Animals, living, for food	305,063		
Other food and drink, nondutiable	82,434,285	162,613,494	174,759,050
Other food and drink, dutiable	58,683,367	175,948,249	174,768,302
Tobacco	8,032,562	41,653,708	85,676,570
Total	295,149,630	719,118,512	767,372,773
Raw materials and articles mainly unmanufactured:

Grand total	525,253,595	798,638,362	1,335,569,027

SHARE OF THE DOMINIONS IN FOREIGN TRADE. The following analysis of the share of the dominions in the foreign trade of the Empire was made by the United States Bureau of Foreign and Domestic Commerce in 1920. In 1919 they supplied £582,570,639 worth out of total imports valued at £1,626,156,212, took £205,620,314 worth out of total British exports valued at £798,635,376, and received £9,641,698 worth of total re-exports from the United Kingdom valued at \$164,749,301, making the dominions' share £797,832,651 out of the year's total trade of £2,589,540,889. How these sums compare with correspond-

Great Britain's total trade in 1919 was 84.5 per cent greater than in 1913, the last complete normal year; but the trade with the dominions all but doubled during this period, the exact percentage of increase being 99.2, whereas that with foreign countries made a gain of 78.6 per cent as between the two years named. The dominions' share in the total foreign trade of the United Kingdom was 28.5 per cent in 1913 and 30.8 per cent in 1919.

The nature of the imports from British possessions into the United Kingdom may be gauged from the following table:

<i>Classification</i>	<i>1913</i>	<i>1918</i>	<i>1919</i>
Food, drink, and tobacco	£75,975,692	£166,460,470	£218,108,622
Raw materials and articles mainly manufactured	91,538,780	176,622,109	302,119,571
Articles wholly or mainly manufactured	28,845,019	76,952,466	59,118,000
Miscellaneous and unclassified	656,404	2,999,926	3,224,446
Total from British possessions	£191,515,895	£423,034,971	£582,570,639
Total from all countries	768,734,789	1,316,150,908	1,626,156,212

ing total in 1918 and the pre-war year 1913 appears below:

<i>Years</i>	<i>Foreign countries</i>	<i>British possessions</i>	<i>Total</i>
<i>1913</i>			
Imports	577,218,844	191,515,895	768,734,739
Exports	329,938,481	195,806,808	525,245,289
Re-exports ..	95,959,662	13,618,375	109,578,037
Total, 1913	1,003,116,987	400,488,078	1,403,555,065

As above figures show, imports from British possessions formed 24.9 per cent of the United Kingdom's total imports in 1913 and 35.8 per cent in 1919. In 1913 out of the aggregate British exports of £525,245,289 the value to British possessions amounted to £195,306,808; in 1918, £178,362,122 out of a total of £501,418,997; and in 1919, £205,620,314 out of an aggregate of £798,635,376. The value of the exports of food, drink, and tobacco to British possessions during the three years was:

<i>Food, drink and tobacco</i>	<i>1913</i>	<i>1918</i>	<i>1919</i>
Grain and flour	£241,494	£339,017	£932,237
Meat and animals for food	512,786	111,441	235,846
Other food and drink	9,894,208	4,793,339	7,945,270
Tobacco	1,508,043	2,699,170	2,080,328
Total to British possessions	£12,751,531	£7,942,967	£11,193,681
Total to all countries	£32,587,942	£12,016,823	£38,804,599

<i>Years</i>	<i>Foreign countries</i>	<i>British possessions</i>	<i>Total</i>
<i>1918</i>			
Imports	893,115,932	423,034,971	1,316,150,903
Exports	328,056,875	178,362,122	501,418,997
Re-exports ..	25,853,749	5,091,832	30,945,081
Total, 1918	1,242,026,556	606,488,425	1,848,514,981

<i>Years</i>	<i>Foreign countries</i>	<i>British possessions</i>	<i>Total</i>
<i>1919</i>			
Imports	1,043,585,573	582,570,639	1,626,156,212
Exports	593,015,062	205,620,314	798,635,376
Re-exports ..	155,107,603	9,641,698	164,749,301
Total, 1919	1,791,708,238	797,832,651	2,589,540,889

FINANCE. The budget for 1920-21 was as follows:

ESTIMATED REVENUE, 1920-1921	
Customs	£150,000,000
Excise	198,650,000
Total customs and excise	£348,650,000
Motor vehicle duties	4,500,000
Estate, etc., duties	45,000,000
Stamps	25,200,000
Land tax and house duty	2,500,000

Income tax (including super-tax)	385,800,000
Excess profits duty, etc.	220,000,000
Corporation profits tax	3,000,000
Land value duties	500,000
Total inland revenue	£682,000,000
Total receipts from taxes	£1,035,150,000
Postal service	37,000,000
Telegraph service	5,750,000
Telephone service	10,250,000
Total post office	£53,000,000
Crown lands	£2650,000
Receipts from sundry loans, etc.:	
Ordinary receipts	744,000
Special receipts	8,756,000
Miscellaneous:	
Ordinary receipts	18,000,000
Special receipts	302,000,000
Total receipts from non-tax revenue	£383,150,000
TOTAL REVENUE	£1,418,300,000
Borrowings to meet expenditure chargeable against capital	£10,366,000
ESTIMATED EXPENDITURE, 1920-1921	
<i>Consolidated fund services</i>	
National debt services:	
Inside the fixed debt charge	£24,500,000
Outside the fixed debt charge	320,500,000
	£345,000,000
Road improvement fund	£6,650,000
Payments to local taxation accounts, etc.	10,818,000
Land settlement	12,000,000
Other consolidated fund services	1,730,000
Total consolidated fund services	£376,198,000
<i>Supply services</i>	
Army	£125,000,000
Navy	84,372,000
Air force	21,057,000
Civil services	497,818,000
Customs and excise, and inland revenue departments	10,468,000
Post office services	49,689,000
Add, supplementary estimates to be presented	20,000,000
Total supply services	£807,904,000
TOTAL EXPENDITURE	£1,184,102,000
Balance available for debt reduction	234,198,000
TOTAL EXPENDITURE	£1,418,300,000
Expenditure chargeable against capital	10,366,000

The budget for 1920-21 increased the super-tax on incomes over £30,000; the duties on spirits and wines; stamp duties; postal duties; and duties on capital stock registration. In general, these increases were approved. There was also a new tax of 5 per cent on the profits of corporations, but restricted to limited liability companies. This was criticized as unfair in its application. The excess profits duty was raised from 40 to 60 per cent. This brought out strong objections from the business community. The budget provided for a surplus of £234,198,000 which was to be applied to the re-payment of the debt, but only £70,000,000 would be applicable to the re-payment of the floating debt. The measures provided for the re-payment of the floating debt were criticized as inadequate. When the budget reached its report stage there was a formidable attack upon it and a large number of the government's Unionist supporters voted against the increase of the excess profits duty, which was described as unfair and oppressive and as tending to keep up prices.

The following table shows the external debt

of Great Britain on March 31, 1920, and the countries in which the debt is repayable:

United States	£1,046,774,000
Canada	73,412,000
Japan	7,170,000
Argentina	19,200,000
Uruguay	5,954,000
Netherlands	743,000
Spain	2,500,000
Sweden	826,000
Fiji	434,000
Straits Settlements	7,656,000
Mauritius	532,000
Sundry allies	113,500,000
Total	£1,278,714,000

At normal exchange this would represent an aggregate of \$6,222,862,000. From the standpoint of leading London bankers the satisfactory aspect of these figures was that during the period March 31, 1919, to March 31, 1920, a net reduction of £86,136,000 had been effected, while after the latter date arrangements were made for further reductions amounting approximately to £80,000,000.

According to the Chancellor of the Exchequer the approximate national debt outstanding on Nov. 30, 1920, was:

Funded debt (2½ per cent consols, etc.) ..	£315,000,000
Terminable annuities	18,500,000
34 per cent war loan, 1925-1928	62,700,000
4½ per cent war loan, 1925-1945	12,800,000
5 per cent war loan, 1929-1947	1,949,300,000
4 per cent war loan, 1929-1942	67,200,000
4 per cent funding loan, 1960-90	407,000,000
4 per cent Victory bonds	857,700,000
Exchequer bonds, 1920, 1921, 1922, 1925, and 1930	315,000,000
4 and 5 per cent national war bonds ..	1,441,000,000
Treasury bonds, 5-15 year	13,850,000
Treasury bills	1,111,564,000
Ways and means advances	222,614,000
National savings certificates	277,900,000
Other debt	1,163,500,000
Total	7,735,628,000

The excess profits duties and the question of taxing wealth acquired in war time were the subjects of interminable discussions during the year and in the spring a select committee was appointed by Parliament to investigate the war time increases of wealth. It published its report in May. Its recommendations were not confined to the tax on war profiteers or to those who had grown wealthy on account of the war conditions as by the sale of goods at scarcity prices, etc. It made no distinction between those who had added to their wealth by saving or by enterprise, or by the receipt of legacies, saying that it was not practicable to determine whether or not the circumstances under which wealth was acquired were meritorious. The Board of Inland Revenue decided that the government and Parliament must assume the responsibility of deciding that £500,000,000 should be raised by the taxation of about 75,000 people which was the number of those who had in various ways been enriched by the war. As to a levy on capital which was proposed in certain quarters, the business community were determined to resist it by every means in their power. It was condemned on the ground that it did not distinguish between the different forms of acquired wealth or conform to the just principle that the people who had taken advantage of the nation's necessities should make a special contribution. The general opinion in the business world appeared to be that even the continuance of the excess

profits duty at 60 per cent was preferable to a levy on capital.

RAILWAYS. During 1920 the railways of the United Kingdom continued under the control of the State, exercised by the Ministry of Transport, Sir Eric Geddes, Minister, but this control according to the terms of the Ministry of Transport Act of 1919, was to cease on Aug. 15, 1921. There was, however, during the year no provision made for the financial returns which were guaranteed as equivalent to the net receipts of 1912. As a result there was comparatively little in the way of new construction or improvements carried on by railways whose future financial state was problematical and uncertain and whose future condition was likely to be influenced by national policies. During the year there were conferences between a committee of the Railway Companies Association and the Ministry of Transport, the latter agreeing to consult with the Railway Committee before introducing any new legislation. As matters developed during the year it seemed that any attempt by the government towards the nationalization of railways was no longer to be looked for, but a grouping of the railways in the future and their control in many ways were proposed. These and other questions were discussed and debated during the year, with the publication of various State papers bearing on the subject, but little positive action was taken bearing on the future. On Jan. 10, 1920, railway freight rates were increased, and again on September 1, resulting in a total increase of 112 per cent above those in force in 1914. Similarly passenger fares were raised another 25 per cent, or a total of 75 per cent above the 1914 scale, and season tickets on August 5 were raised to 50 per cent above the 1914 figures, while on September 1, workmen's fares for the first time were increased. An interesting event in British railway administration was the compilation of ton miles, engine hours, car loading, car miles, etc., in standardized form, begun on Jan. 4, 1920, and followed July 1, 1920, by passenger mileage statistics.

The financial conditions of operation were shown in a statement of the Ministry of Transport dealing with the financial results of the working of the railways during the six months ended Sept. 30, 1920. The total revenue earned was \$453,501,111. The total expenditure was \$415,866,636, leaving a balance of revenue earned over expenditure of \$37,634,475. The standard year proportion of net receipts under the given guarantee was \$88,581,500, to which was added for interest on capital works brought into use \$2,026,500. Thus the net government liability for the six months ended Sept. 30, 1920, was \$54,741,928. The traffic revenue earned was distributed roughly as follows: passenger traffic, \$223,982,885; freight traffic, \$247,562,711. For the month of September there was a net government surplus of \$799,697. This was the first surplus shown in any monthly return for the railways of Great Britain. The passenger receipts for September were \$38,923,500, or 17¼ per cent higher than those for the same month of 1919. Freight traffic for the month of September increased 124 per cent as compared with the receipts for the same month of the previous year. Tonnage had increased by about 14 per cent. The coal strike was estimated to have caused a loss in the revenue of the railways of approximately \$28,000,000.

The most important construction work of the year was on the London Northwestern and consisted of the Chalk Farm widening, a part of the Euston and Watford widening to provide for the new electrical service. This would give six running tracks under Primrose Hill, two of which were twin iron-lined tunnels 16 feet in diameter to be used for electric services, and were a part of the improvement which also involved some readjustment of trackage. The work, started in 1913, was interrupted in 1914 and ceased in 1917 entirely. It was resumed in October, 1919, and its completion was looked for in 1922. On Aug. 3, 1920, the Ealing and Shepherd's Bush line of the Great Western was completed, 4188 miles. This line was worked electrically by third rail system. On the Northeastern line the series of widening on the main line were reaching completion by the end of 1920, being rendered necessary by the increase of travel between England and Scotland. The new railway on the north side of the river Tees was finished and placed in use on June 21, connecting at the Billingham Beck end with a line from Haverton Hill to Billingham, the project forming another route between Stockton and Port Clarence, and giving increased facilities to the many industrial developments in this region along the north side of the Tees. The London and Southwestern had under way during the year important rebuilding and extensions of the Waterloo Terminus so as to handle the increased traffic caused by the electrical service. There was also in progress a new classification yard at Feltham covering 79 acres with a total of 27 miles of siding, 15 miles of which were being used in 1920. There was involved in this work not only grading and track-laying, but also bridge construction, stream diversion, pipe re-location, etc. The Great Eastern during the year improved its Liverpool-street western suburban service at a cost of some \$400,000 and engaged in a number of other improvements. In Scotland the North British Railway was engaged in a few improvements at Berwick, Dunferline Upper Station, and at Dumfries, where a new viaduct was being constructed.

The sole new railway project to be sanctioned during the year was the Derwent Valley, Culver and Haasop, to run from Grindelford on the Dore and Chindly section of the Midland, to Haasop on the Manchester and Derby section. Electrification of many lines was discussed during the year but without positive action. On the Northeastern the project to electrify the main line between York and Newcastle was postponed. The London and Southwestern also abandoned temporarily the extension of its electrical service to Guildhall. The London, Brighton and South Coast Company, however, stood ready to complete the main line to Brighton as soon as the outlook was favorable. On September 29 a departmental committee of the Ministry of Transport, appointed in March to consider and report on electrification of British railways, presented an interim report after a series of meetings.

MERCHANT SHIPPING. Statistics published by Lloyd's register in the latter part of the year showed that Great Britain was well ahead of the United States in the building of merchant vessels. During the war the United States had easily taken the lead. Before 1914 Great Britain held the first place, but the necessity of war absorbed a large part of her building capacity and

drew into the service many of the merchant ships. After the armistice the British shipyards were employed again in the building of merchant vessels but they could not be devoted exclusively to that work for a number of months as it was necessary to complete the various war vessels that had been begun and to refit those merchant ships which had been used as war-vessels. After that the industry proceeded rapidly and at the beginning of 1920 the output of British ship yards already exceeded that of the American yards and by June, 1920, the figures were as follows: United States, 2,105,965 tons, or a decrease on the part of the United States of about 2,000,000 tons as compared to Great Britain, 3,578,153 tons, or an increase during the year of 1,323,000. In October the orders were still flowing in to the British ship yards, many of which had been enlarged while in the United States several of the navy yards created during the war had been closed on account of the cessation of orders from the government. Still British merchant shipping had not even then made up all of its losses in spite of the addition of the German ships and its tonnage was 781,000 less than in 1914. The percentage of the world's tonnage possessed by Great Britain was 54.4 and in 1920 it was 49.6. The merchant fleet of the United States had increased with great rapidity during the war and even after the diminution above mentioned it counted 2,000,000 tons more than six years before or an increase of 600 per cent. The number of vessels in the world in 1920 was given as follows: steamships, 26,513; sailing vessels, 5082; total 31,595; with a total tonnage of 57,314,065 of which the United States possessed 43 per cent. The above figures show a decrease in sailing vessels from 22 per cent in 1902 to 6 per cent in 1920. Great Britain was thus in a good position for the approaching competition with America and the shipping authorities in England had no fear that the United States would outstrip them. The great English companies were showing much enterprise in regard to passenger traffic. They were refitting several of the great transatlantic liners and providing for the consumption of oil instead of coal and they promised to offer travelers a prompt and comfortable service.

The nationality and net tonnage of vessels with cargoes entering and clearing from British ports in 1913, 1919, and 1920, were as follows:

Nationality	1913	Enter. d	1920	1913	Cleared	1920
	Tons	1919	Tons	Tons	1919	Tons
British	32,292,348	22,079,612	25,530,845	40,101,232	21,962,895	23,408,613
Russian*	677,861	186,944	121,972	937,224	190,253	94,827
Swedish	1,891,207	1,018,334	1,288,059	8,015,650	1,582,684	1,117,683
Norwegian	3,284,789	1,436,265	1,881,794	4,683,138	2,054,314	2,918,682

United States	724,473	1,625,498	2,357,577	370,258	609,020	1,241,727
Japanese	139,623	339,710	441,450	281,705	240,265	416,946
Other nationalities	124,734	144,841	385,880	185,442	241,095	358,057
Total	49,064,233	29,570,690	36,518,236	67,819,701	34,562,107	36,589,406
Total foreign	16,771,890	7,491,078	10,987,391	27,718,469	12,599,212	18,180,793

* From Jan. 1, 1920, Finnish vessels have been included under "Other nationalities."

It will be observed that in vessels entered and cleared, American tonnage was more than three times as large in 1920 as in 1913, and that the

tonnage thereof cleared with cargoes in 1919 and 1920 was considerably over 1,000,000 tons less than the total so entered. British clearances in 1920 were more than 2,000,000 less than the entrances.

ARMY. There was much comment in the press toward the close of the year on the large number of troops still in service and it was pointed out that the military forces of the empire were double the strength of pre-war times. This was attributed to the large number of troops required in Ireland, Egypt, India, and elsewhere. The number of troops in Ireland was placed in November at 75,000; in Egypt, 60,000; in Palestine, 44,000; in Mesopotamia and Persia, 120,000; in the Black Sea area, 20,000; while the Indian army was placed at more than 200,000.

On December 31, the strength of the effectives was: White troops, 295,000; territorials, 233,000; native and colonial, 130,000. See NAVAL PROGRESS; and MILITARY PROGRESS.

MINISTRY. At the close of the year the cabinet was constituted as follows: Prime Minister and First Lord of the Treasury, D. Lloyd George; Lord President of the Council, A. J. Balfour; The Chancellor of the Exchequer, Austen Chamberlain; Without Portfolio, Sir L. Worthington Evans; Lord Privy Seal, A. Bonar Law; Lord Chancellor, Lord Birkenhead; Secretaries of State: Home Affairs, Edward Shortt, K.C.; Foreign Affairs, Earl Curzon; Colonies, Viscount Milner; War, W. S. Churchill; India, H. E. S. Montagu; First Lord of the Admiralty, Walter Long; Minister of Health, Dr. C. Addison; President of the Board of Trade, Sir R. S. Horne; Minister of Labor, Dr. T. J. Macnamara; Air Minister, W. S. Churchill; Minister of Agriculture, Lord Lee of Fareham; President of the Board of Education, H. A. L. Fisher; Transport, Sir Eric Geddes; Secretary for Scotland, R. Monro, K. C.; Lord Lieutenant, Viscount French, and Chief Secretary for Ireland, Sir Hamar Greenwood.

HISTORY

THE IRISH QUESTION; HOME RULE BILL. The Home Rule bill of Government of Ireland act, was introduced, February 25. Its main provisions had been proposed by Lloyd George in 1919 and were noted in the preceding YEAR BOOK, but they may be briefly summarized here as follows: Two parliaments, each with a single chamber—one for Northern Ireland and one for Southern Ire-

* From Jan. 1, 1920, Finnish vessels have been included under "Other nationalities."

land; a council of Ireland to serve as the instrument of adjustment between the two and to consist of 20 members of each parliament under the

king as president; the two parliaments to have the right to substitute for this council a parliament for the whole of Ireland, whose constitution was to be determined by the provincial parliaments; jurisdiction on the part of the provincial parliaments over all matters except the succession to the throne; peace, war, military affairs, naval affairs; treaties, extradition, etc.; treason, naturalization, etc.; external trade; cable, wireless, light-houses, aviation, coinage, etc.; and in addition certain things reserved specifically; executive power vested in the lord lieutenant; the provincial ministers to be privy councillors and not to hold office longer than six months, unless a member of the provincial House of Commons and has tenure of office subject to the pleasure of the lord lieutenant if he does not head a department; constabulary and metropolitan police to be retained till transferred to the provincial parliaments, but this must be done within three years; parliaments to hold annual sessions; the southern house to have 128 members, the northern, 52, and elections to be by proportional representation; the provincial parliaments not to pass money bills unless recommended by the lord lieutenant; representation of the Irish in the imperial parliament to consist of 42 members until otherwise determined by parliament; parliaments empowered to impose taxes other than customs duties, excise, excess profits duties, and the income tax of the United Kingdom; repeal of the government of Ireland act of 1914.

The second reading was reached on March 31, when it passed by a vote of 348 to 94. Among the leaders in the opposition to it were representatives of the British Labor party and of the Irish Nationalists, Lord Robert Cecil, a Coalition Unionist, and Mr. Asquith, former Liberal premier. It was criticized from various points of view, among others that it cut Ireland in two and placed it under a cumbersome and costly double government. This objection was advanced by Mr. Asquith, who favored the placing of Ireland on the footing of a dominion. The government objected that this came to the same thing as making it a republic. Mr. Asquith's amendment to establish a single parliament was defeated, May 10, by a vote of 259 to 55. Throughout the months of May and June discussion was at intervals resumed, but the opposition took little interest and the chief part was taken by the Unionist members. Its critics declared that it was the government's policy to take advantage of the present temper of Parliament to force through a measure obnoxious to the Irish majority. On the second reading of the bill its rejection was moved by Mr. Clynes, who was supported by Mr. Asquith. On November 12 it passed its third reading in the House of Commons and was then sent to the House of Lords. It finally received the royal assent late in December. After all the discussion and criticism it still contained practically the same features that had been implied in the outline by Lloyd George a year before.

THE IRISH QUESTION: REVOLT AND REPRESSION. On January 15 the municipal elections showed large gains for the candidates who favored an independent Irish republic. This was followed by greater boldness on the part of the Sinn Fein agitators, who at the end of January displayed the flag of the Irish republic on the tower of the municipal building next door to

Dublin Castle. The Sinn Feiners from the beginning were convinced that they had the majority of the Irish people behind them and they steadily denounced the government's Home Rule bill and opposed all government attempts at settlement. The city of Dublin chose for mayor the Irish agitator, Tom Kelly, who had passed two years in prison, and in many Irish cities Sinn Fein chairmen were elected. In the contest over Ireland, the English Labor party showed on many occasions its sympathy with the Irish demand for an independent republic, though it declared itself opposed to the complete separation of Ireland from the empire. Government troops arrested all the Sinn Fein officials, January 31, at Dublin and several other cities, who had been accused of acts of rebellion, and sent them to England on British warships. On March 20th occurred the murder of the mayor of Cork, Thomas MacCurtain, which was attributed by the Sinn Feiners to British agents. Certain British newspapers however said that the Sinn Feiners had committed the murder because MacCurtain had denounced their crimes. The coroner's jury declared that he had been murdered by the Irish Royal Constabulary and laid the guilt at the door of Lloyd George, Lord French, and other officials. His successor was Terence MacSwiney (q.v.). The repressive policy of the British government continued under Sir Hamar Greenwood, who succeeded to the office of Chief Secretary for Ireland April 2d. In April attacks were made on the police barracks and on government officers. Records and other papers were burned in the offices of government inspectors, tax collectors, and surveyors. It was reported that more than 200 police barracks were destroyed. The driving away of cattle was another feature of the disturbances. A hunger strike on the part of about 100 prisoners at Mountjoy began April 4th. On April 13th the Irish Trades Union Congress called a general strike, but on the following day the government released the hunger strikers and the general strike ceased. Many police barracks were burned May 12th-13th when some 50 of them were attacked by armed Sinn Feiners. Thereupon the government began to pour in more troops, estimated at the number of 80,000, and at the same time a large number of discharged English and Scottish soldiers were added to the Royal Irish Constabulary. Radical members of the Irish Labor party retaliated by refusing to unload the munitions as they arrived at Dublin. There was a strike of railway men May 24th which checked all traffic, and the workmen in the power stations quit work at the same time thus putting an end to the unloading of munitions from vessels. New municipal elections, June 4, showed great Sinn Fein gains in Munster, Connaught, Leinster, and even in parts of Ulster, where they elected their candidates on the county councils. There were further raids upon the police barracks in June, and on June 13th a boycott of the Irish Royal Constabulary was begun, which resulted in delaying the sending of food and other supplies to the policemen and their families. It was announced by the government on June 15th that it would pass the Home Rule bill at an early date and that if the Parliament of the South should not be organized, the Lord Lieutenant and a committee of the Privy Council would assume its powers. On June 19th riots occurred between the Unionists and the Sinn Feiners in Derry, giving the city over to mob rule for several days.

In August fighting took place in the Belfast shipyards. Early in that same month the government carried through the Restoration of Order in Ireland bill, giving extraordinary power to the Irish authorities. The Royal Irish constabulary was recruited by the creation of an Auxiliary Division consisting of English ex-service men. At the end of August there was rioting on a large scale in Belfast, which resulted in depriving many citizens of their homes.

THE IRISH QUESTION: MURDERS AND PILLAGE. The "Black and Tans" (English recruits to the Irish Constabulary) sacked the town of Balbriggan in September and other cases of government violence were alleged in Trim, Mallow, and elsewhere. Although the government through its representative in Ireland, Sir Hamar Greenwood, declared that it could not countenance reprisals, such acts continued to be frequently reported. There was a general demand in quarters opposed to the government that an impartial inquiry into reprisals should be made, but after the re-assembling of Parliament, October 19, this was refused by the government. Meanwhile the breaches of peace continued. There was an encounter between the troops and the Sinn Feiners near Enniskerry, North Wicklow, September 17; fighting at Cork and Belfast, September 20; the murder of a Sinn Fein Limerick official, September 22; and, October 9-10, the Cork post office was damaged by bombs and British officials near the city ambushed and one of them killed.

Hardly a week passed without the report of a number of incidents similar to the above or worse. One of the most serious occurred in Dublin, Sunday, November 21. The police by that time were meeting with more success, their round-up of the Sinn Feiners having collected a great mass of evidence and secured the arrest of many important prisoners. In retaliation a series of murders were committed in the forenoon of November 21st in a systematic manner, which evidently proved a thorough organization for the purpose. The murderers, who passed through the streets by one's or two's in order not to attract attention, gathered in groups of 10 or more at the houses where officers and civilians connected with the court-martial proceedings against the Sinn Feiners, were living. They entered hotels and private houses and finding their way to the men's rooms killed 14 of them and wounded others. The police retaliated in the afternoon at a hockey match in Croke Park where some 3000 spectators were gathered, among whom they suspected some of the criminals were to be found. On the approach of the police some of the Sinn Fein pickets fired at them. This brought a return fire in which 10 men were killed and many others wounded. At least two of the crowd were trampled to death in the panic. The government's account of the affair in Parliament on November 22d, led to a stormy discussion which came near degenerating into a scuffle. On November 30th, a detachment of the Auxiliary Division was ambushed and 17 were killed.

As to the murder of British authorities in Ireland, they were defended by Sinn Fein leaders on the ground that they were justifiable reprisals of a defenseless people against their brutal oppressors. Dr. de Valera who had assumed the title of President of the Irish Republic declared that there was no comparison between the guilt of the British soldiers who shot down the civilians and the Irishmen who killed those soldiers.

The soldiers in Ireland were making a barbarous war on people who were not guilty of any oppression of England, and if the British would withdraw their forces in Ireland, every individual in those forces would be unmolested. Many charges of murder and even of massacre on the part of the British troops of Ireland were made by their opponents.

THE IRISH QUESTION: HUNGER STRIKES. In addition to the strike of the Mountjoy prisoners above mentioned, there were several sensational cases of hunger striking among the prisoners arrested for seditious activity in connection with the Sinn Fein movement. The most conspicuous of these was the case of Terence MacSwiney, Lord Mayor of Cork, who died after a hunger strike of 74 days on October 25th. (See MACSWINEY, *TERENCE*.) On the same day, October 25, Joseph Murphy, another hunger striker, died in Cork jail. He had been one of 11 men imprisoned two days before MacSwiney was sent to Brixton prison and his hunger strike lasted 76 days. All these 11 prisoners went immediately on a hunger strike and one of them, Michael Fitzgerald, had died the week before Murphy's death.

THE IRISH QUESTION: THE SITUATION IN THE AUTUMN. On September 29th, Viscount Grey proposed the settlement of the Irish question by placing the country on a dominion basis, leaving to the central government only the control of the departments of foreign, military, and naval affairs. This was rejected both by the Sinn Fein leader, de Valera, and the Unionist leader, Sir Edward Carson. The former contended that Ireland had the right to control her own destinies. On October 9th, the Prime Minister rejected the plan for dominion rule and declared that the government would continue its policy of stern suppression until the campaign of crime had come to an end. Mr. Asquith went further than Lord Grey and did not require even the reserve to the British of foreign affairs and the army and navy; while Mr. Henderson of the Labor party demanded that Ireland should be entirely free to determine her own destination. Lloyd George defined the policy of the government in a speech at Carnarvon, the leaders in the Irish movement having by that time definitely rejected any proposal other than that for granting complete independence. He said that the government believed in a strong policy and that it was necessary to finish with what he called a band of assassins. He said that he would not permit Ireland to fall into complete anarchy, and that it was the duty of every statesman to suppress the violence of a minority. Whatever the cause might be, such methods could not be admitted into a well organized state and they could only damage the purpose their authors had at heart. By resorting to civil war, the Sinn Feiners had plainly condemned themselves. The first consequence of setting up dominion home rule in Ireland he said might be the establishment of forced military service in Ireland, and England would then have to adopt the same measure, as she could not have in her neighborhood an independent army of 500,000 men, while she herself possessed only 100,000. Ireland all during the war had been a source of alarm to England. The Irish had fired on British soldiers in Dublin in 1916; they had conspired with leaders of German submarines in 1917 and 1918; and two months after the last German offensive they were ready to raise an army in Ireland in order to attack

England in the rear. He declared that these facts could not be contested. If things came to such a pass that England had always to fear Ireland as an enemy when she had to defend her own power in the world it proved that some equitable settlement must be found. While he would not consent to a Home Rule plan, which would permit Ireland to dispose of an independent army and navy, he was ready to bestow on the island an independent government and to permit the Irish to administer their own affairs as they chose. In other words Lloyd George on this occasion simply repeated the proposals that had frequently been discussed before and had been absolutely rejected not only by the Sinn Feiners, but even by the Nationalists. Many other suggestions had been made for the compromise of the issues between the two parties; but the leaders of the Irish movement would not accept them. It appeared that the Sinn Feiners had preferred civil war to any relaxation of their demands. Outside of England, although the opinion was generally favorable to the Irish the attitude of the latter toward the question of Ulster weakened the general sympathy. On the one hand the British government seemed disposed to make all concessions compatible with its imperial interests and on the other was the Irish organization which showed completely irreconcilable spirit. As affairs stood in November, it appeared that the British government would never grant complete independence to Ireland unless it was forced to do so, while Ireland showed no disposition to yield on any point. The persistency of the Sinn Feiners seemed to lead to no other result than a civil war in which their cause must be lost. Meanwhile the condition was that of private war carried on by means of assassination. Nevertheless in the United States general sympathy as judged by the press was on the side of the Sinn Fein.

THE IRISH QUESTION AT THE YEAR'S CLOSE. It was announced by the government on December 10th that martial law was to be proclaimed in four Irish counties. Many business houses were destroyed in the centre of Cork, December 12, in the course of a fire started by incendiaries, and other serious damage resulted. Toward the end of the year the government published a list of outrages committed by the revolutionists, December 18 to January 1, as follows: Destruction of 69 courthouses and 532 barracks belonging to the Royal Irish Constabulary; 31 raids on the mails; and the damaging of 73 other barracks belonging to the constabulary. The Crown forces were reported at the same time to have suffered the following losses: Military, 54 killed and 116 wounded; police, 176 killed and 351 wounded. Meanwhile a Labor commission had been created to investigate the methods of administration. It published its report December 28th. This condemned the government's method and brought grave charges against the government forces. A meeting of the Labor members of Parliament was held in London, December 29, which unanimously adopted a resolution defying the government to disprove these findings of the committee. It defended the right of Ireland to dispose of her own destinies and attacked the repressive policy of the government. The plan approved at the meeting for the settlement of the question, included first, the withdrawal of all the armed forces; second, the placing of the responsibility for the maintenance of order in each local-

ity in the hands of the local authorities; third, preparations for the immediate election by proportional representation of a constituent assembly for the framing of a constitution acceptable to the Irish people.

THE GOVERNMENT AND THE COAL INDUSTRY. The system of state control established during the war was continued with certain changes afterwards and this status lasted during 1920. In general the government regulated prices and guaranteed a certain standard of profits to the mine-owner by a charge on the more profitable mines, the surplus if there were any after the profit had been paid, to be retained by the government. As a basis for determining the standard of profits the government allowed the mine-owners to choose the best four out of six or the best two out of three years before the war, or in place of that to accept a profit of 9 per cent. It was said that this guaranteed a profit of £22,000,000 to the mine-owners which was £9,000,000 in excess of the average profits before the war, and the mine-owners paid the excess profits' duty only on profits above that figure. In addition to this the sum of £4,000,000 was guaranteed to the owners as interest upon the new capital applied to the industry. Thus, £26,000,000 were free from the excess profits' duty. Furthermore they were to have one-tenth of any surplus profits above that limit and the profits accruing from coke ovens and by-product plants were not under the Coal Controller. These amounted to between £6,000,000 and £11,000,000. On behalf of the miners it was argued that this was absurdly favorable to the owners. It would have been reasonable in fixing the profit standard, to base it on the average profits during the war, which was, exclusive of royalties, about £13,000,000 a year, royalties being placed roughly at £6,000,000. The present arrangement, it was claimed, guaranteed the owners more than twice their pre-war profits, while they permitted them actually to receive nearly three times as much as they had received before the war. When the legislation on the subject came before Parliament early in the year, the miners attacked this arrangement. In the autumn the question arose over the surplus which the government received after admitting these profits to the owners. This surplus was extremely large on account of the sale of coal abroad at famine prices in response to the enormous demands of the Continent. The figure was placed by the trade unions at about £60,000,000 but the government rated it much lower. Such a surplus was described as a reward for taking advantage of the wretched peoples on the Continent and the arguments against it appealed to justice and to the spirit of national comity. On the other hand the government embarrassed in its need for revenue wished to retain this source of profits. In the debate on the subject, the government maintained that the entire surplus should be employed for the relief of taxation. The miners argued that this was in effect an indirect taxation upon the users of domestic coal.

In August they presented the following demands: (1) Reduction in the price of domestic coal by 14 shillings, 2 pence—this amount being that which the Coal Controller had added in May; (2) Advance in wages of 2 shillings a shift on the ground that they had not kept up with the cost of living. The government refused on the ground that the home consumer was getting coal

at cost and declared that it could not consent to an increase in wages unless the miners guaranteed the output. It said the profit on export coal ought to go to the exchequer. It proposed an advance proportionate to the total output, namely, an increase of 1 shilling when the output was 240,000,000 tons, 1 shilling, 6 pence when it was 244,000,000 tons and 3 shillings when it was 256,000,000 tons. The miners dropped the first of these demands rather than go on strike. The government's principles of making the wages proportionate to the output appealed to the general public as a reasonable means of insuring an adequate supply at a fair price. Friends of the miners argued, however, that when seen from the point of view of the individual workman it was not reasonable for it was not to be supposed that an individual miner's wages should be dependent for their increase on the increased output in the whole industry throughout the whole country. This would not affect the individual's willingness to put more energy into his work, for the reward was too uncertain and depended on too many elements with which he had nothing to do. It violated the principle that individual earnings should correspond to individual efforts. Then it was asked what the relation of wages to profits would be in such a scheme. Sliding scales worked successfully in certain cases where there was an exact relation between profits and the output, but there was no such relation in the present case. In fact in certain cases it had been profitable to the owners to restrict the output. The main point urged against the government's proposal, however, was that it was unreasonable to suppose that an increased output could be secured mainly by increased efforts on the part of the miners. The output was limited by other factors than the labor of the miners. During the four years of war the equipment deteriorated, because suitable machinery and supplies of various kinds could not be got, and these conditions continued afterwards owing to the reluctance of investors to invest in an industry that might be nationalized. Technical deficiencies therefore hampered production aside from the defects of private ownership. These latter defects had been previously pointed out many times by the miners in their argument for nationalism and they included such things as the drowning out of coal on account of the inability or unwillingness of owners to combine for drainage schemes, and the losses owing to the great waste in distribution. Restrictions of output, owing to technical deficiencies had reacted upon the miners and they had frequently lost their impulse to do their utmost. When a mine restricted its output on account of defective transport one week, it was natural that the miners should not bestir themselves to increase it the next week. They had no power thus to remove these technical obstacles and they were indignant that they should be held to account for them, especially as they had repeatedly urged that the government should take measures for the removal of these obstacles. It was asked why the government if it really desired to increase the output did not insist at once on the proper equipment and organization of the industry. It was charged that their only reason for not doing so was their fear of offending the mine-owners. Evidence on the subject of these deficiencies had been given by the former director of collieries, Sir Richard Redmayne, before the Coal Commission and con-

ditions had not been changed since. When the Federation of Mine-Workers demanded a reduction of 14 shillings and 2 pence in the price of domestic coal, a great wave of indignation swept over the government and its press. Friends of the miners asked why it was that a Prime Minister posing as the protector of the poor who would naturally have repudiated a proposal to increase prices should make such an outcry over a proposal to lower them.

The watchword of the government was "*decontrol*," that is to say, a return to normal conditions. The wages of the miners had been partially standardized owing to war conditions. This had involved charges on the plants which made more than the standard profits for the benefit of those which made less. It was argued that in the interest of the consumer as well as the mine-workers this unification should go further instead of ceasing altogether, for the cost of production varied greatly from coal pit to coal pit and the prices must be high enough to cover the cost at the less profitable mines. Such prices yielded an enormous profit to the better placed collieries and the divergence was plainly brought out by the Coal Commission. The owners of the more profitable mines naturally were eager to return to pre-war conditions and therefore favored the introduction of "*decontrol*," at once. The miners' policy of lowering prices was seen to endanger this prospect, for the policy of "*decontrol*" involved an increase of prices until the poorer pits could be made to pay. In short, the miners wished the industry to be treated as a single service and in making this demand they were accused of aiming directly at nationalization. The owners on the other hand wanted to abolish such small measure of unification as was already introduced. In May, the government raised the price of household coal to 14 shillings, 2 pence. They declared that they would not immediately abolish control but their opponents believed that they were pledged to the owners to abolish it at an early date. Previous to 1920 there had been strong expert support of the plan for unification. This had been recommended by the Sankey report and by the majority of the Coal Commission and it had been also recommended by the Coal Controller's office in 1920. As the situation presented itself in the autumn of 1920 it was merely a struggle of interests and appeared not to be working out in accordance with any definite economic plan aiming at the good of the country as a whole. The above account is based on the arguments of Mr. R. H. Tawney, a supporter of the miners. On the other hand it was pointed out that Mr. Robert Smillie in his speech at Wrexham, August 24, had said, "We are determined that the nation shall own the mines, and the time will come when the present exploiters will have to give them up." The following figures for wages and output were presented comparing conditions in 1913 and 1920:

	Number of workers	
1913	1,110,000	
1920	1,206,000	
Increase	96,000	
	Output	
1913	287,500,000 tons	
1920 (estimated)	240,500,000 "	
Decrease	47,000,000 tons	

The result of the miners' ballot upon the ques-

tion of a strike to enforce their demands for higher wages and a reduction in the price of coal to the home consumer was announced, August 31, as follows:

For a strike	608,782
Against a strike	238,865
Majority for strike	367,917
Total votes recorded	845,647
Percentage majority for strike	71.75

After various conferences during the week ending September 10, the government set forth its position as follows:

"Public indifference to the demands of the miners is due to a consciousness of the absolute fairness of the attitude taken by the government in this matter. Mr. Smillie in a speech at Wrexham indicated that the present demands were put forward as a step towards the nationalization of the coal industry. We do not propose to get rid of the control of prices, because we recognize the necessity of keeping a sufficient supply of coal in this country to satisfy our own needs at a price which is fair to the individual consumer. With regard to the wages claim, the concession of the miners' demand would involve an immediate increase in the price of coal. So far as the government is concerned no point of dignity will prevent us trying to achieve a settlement. In so far as the miners' claim is a wage claim, and not a question of policy, the Industrial Court is the body to decide it. So far as any claim is a wage claim the government would welcome a decision by some impartial body."

The attempts to avert the strike of the coal miners by means of a conference, October 1, on the part of Lloyd George and representatives of the miners and owners, respectively, failed of effect and on October 14th, after a new ballot, the Miners' Federation by a vote of 635,098 against 181,428 decided, contrary to the advice of several leaders including Mr. Smillie, to reject the offer of the owners. The latter included an advance of two shillings a shift in wages, provided the coal output was brought to 248,000,000 tons a year. On October 16th, 1,000,000 strikers went on strike. Their action was condemned generally by the press. As to the government, the Prime Minister declared that it had done its best to prevent this calamity, and that it was resolved now to oppose the miners in their attempt to obtain by force their unreasonable demands. The effect on the public was indicated by the following summary by the *London Times* of the resulting measures and conditions:

COAL

Supplies limited to:

One hundredweight a week for each household. (None at all if there is 10 hundredweight in stock.)

Half average weekly supply for works and factories.

GAS AND ELECTRICITY

Gasworks ordered to limit pressure of gas supplied to houses.

Gas or electricity used as power in works or factories reduced to half average weekly supply.

Shop window lighting restricted and illuminated signs prohibited.

FOOD

Nobody to possess more than one week's supply of any commodity.

Sugar ration reduced from 12 ounces to 8 ounces a week.

TRAVEL

Reduction in long-distance railway facilities and in steamship services.

SPORT

All horse racing suspended, except in Ireland. The strike lasted till the beginning of November when a vote on its continuance though giving a majority in favor failed of the requisite two-thirds. The principal points in the settlement submitted to the miners for vote after agreement with the government were as follows:

1. Joint district and national committees on output.

2. A joint scheme to be submitted to the government for the future regulation of wages.

3. Advances of wages by 2 shillings a shift for men, 1 shilling for youths, and 9 pence for boys immediately upon resumption of work.

4. Adjustment of wages from Jan. 3, 1921, and thereafter every four weeks, on the basis of export coal values.

(a) The September (1920) quarter's export coal values are taken as a standard, warranting advances of 1 shilling 6 pence, and 4½ pence a shift on present earnings.

(b) Every increase in the proceeds of export coal by £288,000 a week over the weekly average of the September quarter (after deducting 15 shillings a ton as the cost of extra output) will entitle the workers to an additional 6 pence, 3 pence, or 2½ pence a shift.

(c) All coal raised in excess of a tonnage at the rate of 219,000,000 a year will be assumed to be export coal.

(d) There will be a variation of the owners' one-tenth share of surplus profits, as provided for in the coal mines (emergency) act, proportionately with the rise or fall of wages.

Work was resumed during the first week of November.

PARLIAMENT. Parliament met February 10th. The speech from the throne indicated a programme so long as to be impossible of execution. It included the introduction of bills dealing with Home Rule, the coal industry, peace time regulation of the drink traffic, food stuffs, creation of an adequate supply of cheap electrical and water power, army organization, unemployment insurance, minimum wage, regulation of working hours, agricultural development, the fishing industry, anti-"dumping" and reform of the House of Lords. In addition to this, the Prime Minister declared the necessity of suitable housing measures. There had been serious delays in carrying out the promise previously made by the government in respect to housing legislation, but for this the Prime Minister laid the blame on the Labor element, especially the trade unions. The government came in for some sharp criticism on the part of its enemies. The Labor party attacked it for its Irish policy and its failure to nationalize the coal mines, while the Liberal party criticized it for failing to emphasize the need of national and individual economy. Amendments calling for the nationalization of the mines and expressing regret that the inability of the former enemies to execute the peace terms had not been recognized were lost by a large majority, as was another amendment criticizing the government's financial policy. The main interest during the six months preceding the vacations was centred in the Home Rule bill and the

budget. At the time of its adjournment in the summer few of the above measures had even been introduced. The coal industry and unemployment insurance bills were the only important ones passed. The Home Rule bill was still in the committee stage; and the Agriculture bill had not reached the report stage. The questions of regulating the drink traffic and providing cheap electric and water power supplies had been dropped. Parliament adjourned to October 19th. It then remained in session till December 23d. Chief among the measures passed was the bill providing for the future control of the coal industry. This bill which had been drafted in the spring provided for the return of the mines to private ownership. The ministry had from the first been opposed to nationalization of and even to the compromise measure proposed by Lloyd George in August, 1919, for a union of mines in certain areas directed by committees in which the workmen would be represented, under state supervision. The main features of the bill were the establishment of a separate department of mines charged with insuring safety and obtaining information for the benefit of the workmen and with its setting up of new machinery for the adjustment of disputes. Another important measure carried was the Agriculture bill which aimed to give the farmer security by guaranteeing prices for wheat and oats, and at the same time to give the laborer security through a permanent agricultural wages board whereby a minimum wage would be guaranteed. The measure also aimed to secure the farmer's tenure and to this end largely increase the sum which he was entitled to recover if disturbed. It sought to bring the guaranteed prices into direct relation with the cost of production. In the matter of tenure it provided that notices to quit if their justice was questioned by the tenant should be arbitrated. Other measures included the Dyestuffs bill which aimed to strengthen the dye industry by prohibiting importation; the War Emergency Laws bill; the Official Secrets bill; and the Unemployment Insurance bill, whose provisions are noted below. Important debates aside from finance and the Irish question which overshadowed all others, were the discussion on the coal strike in October which showed a spirit of great moderation; the debate on the retirement of General Dyer for his summary measures in dealing with the Amritsar riots in the preceding year; the debate on the government's course in Mesopotamia; on the Austrian treaty; on the resumption of trade relations with Russia, and other matters of foreign policy.
